Somewhere within these United States dwells the mythical family which lost all its heirlooms and family jewels at the hands of a customhouse official on the Dutch-German, the German-Czechish, the German-Swiss, and the French-German border (on which there are no German guards). No one ever has seen this family, though every traveling American has a friend who has seen someone who knows all of its members. The protesting victim, who ruthlessly was led away and fined $1.50, whom the writer can offer in its stead, was a little Polish Jew.

"Ich habe *gar* nix," he sobbed, as a hundred-pound sack of sugar was taken from around his bare middle, where it had made him stagger so that no customs official in the world could have failed to remark his gait.

Americans, English, Dutch, Swedes, Danes, Norwegians, and Swiss, coming from the so-called *higher* countries, invariably went unchallenged under a universal rule of practice, that a foreigner was entitled to "all necessary and reasonable equipment, including a camera or a pair of field glasses," duty-free, on leaving the country.

Ninety per cent of the persons arrested by frontier guards were found to be attempting to convey into foreign countries money (in foreign currency) which they had made in speculations on the money market, illegally, and entirely at the expense of the German Government. Almost all of the remainder were caught smuggling foodstuffs or gold bullion, or with substantial irregularities in their passports.

That the foreigner fared well in Germany, and much better than at home, cannot well be denied by anyone familiar with the situation of his life there. In 1923, the summer resorts at Rügen, which used to be filled with Germans, had as guests nineteen times as many Czechs and Swedes as members of their own country. Berlin had entire districts given over to Polish and Hungarian Jews, and more than a fourth of all the dwelling houses in the city in the hands of persons who before the war were not German citizens.

While the German population suffered all the losses of demonetization, and hardship gave way to veritable impossibility of the continuance of existence for thousands, the never-failing foreigner was always in evidence. German students at the University of Frankfort am Main were using cloth made from dyed blankets, left by the American Army at Coblenz, for clothes. But if a Pole, Czech, Lithuanian, or Austrian wanted a new suit, he went to Germany and waited for a fall of the mark. Infallibly, he could buy one and live like a rich man for a week, on less money than the suit alone would have cost at home.

From Sweden, Holland, Denmark, Italy, Switzerland, the Baltic, and the Balkans, came an endless stream of "Auslaender," all to exercise their vested right to pick the carcass clean. Always came a lower and more avaricious class than that which had come and gone before it; one which bought a little more, and stayed a little longer. Meanwhile the Germans, to whom the country presumptively belonged, found themselves crowded from every phase of life which had to do with luxury and comfort.

On seven occasions during 1923, the writer left the station at Frankfort am Main, in a second-class compartment, bound for Southern or Central Germany. On six of these occasions all of his fellow passengers were Jews from Southeastern Europe, and on the other all but one were Polish Jews. The "average" German, who, previous to the war, had traveled second-class, was having to content himself with fourth-class accommodations on *local* trains, while such foreigners as those mentioned, to whom "second" was as novel a sensation as that of being rich, were traveling in his stead.

At the opera and in the theaters, German lawyers, doctors, teachers, and professors had been driven to the galleries—or barred from the theater altogether—by acutest poverty. Berlin orchestras, loges, and boxes, however, were full; swarmed with an audience to be found nowhere else in the world than in the lowest amusement places on the East Side of New York; with Hungarian, Austrian (née Polak), Rumanian, and Ga-

Student acting as fireman on a German locomotive.

lician Hebrews, the riffraff that lived off the falling mark.

For 90 per cent of the Germans a living had to be earned, while the ever-spreading lines of prices and earning capacity continued to diverge. Yet it was no uncommon thing for a well-dressed foreigner, obviously a product of the neighboring gutter, to stand on a crowded sidewalk and say in a loud voice: "If it gets

(Concluded on page 15)

What the Year 1924 Did to Make History

Concluded from page 3

but it is certain that the issue will be a very live one in several countries during the next few months and that strenuous efforts will be made to arouse the public mind and conscience of all the member countries on the subject of the outlawry of war by the common consent and joint action of the peoples of the world.

The trend toward a better condition of affairs was clearly evident in Mexico. General Calles, in the election on July 6, is reported to have received more than three-fourths of the popular vote.

The official proclamation of Calles' election was issued on September 29. On November 30 he was inaugurated, and for the first time within the memory of any one present a Mexican president had regularly and legally participated in the installation of his duly elected successor.

Dimly but no less certainly there looms on the horizon the end of the dictatorship of Benito Mussolini in Italy. The end may not, probably will not, come in 1925 largely because there is no visible alternative. But this very factor makes it inevitable.

Had the assassination of the radical deputy, Giacamo Matteotti, in June, been merely a political act like others very much the same but less heinous, even though it had been equally patently a Fascisti deed, the reaction would not have been so great.

But it was not a political, it was an economic move. Its purpose was the suppression of evidence revealing graft in the cabinet of the dictator—graft of which he was presumed to be ignorant. Predatory interests had fastened themselves upon him and his advisors. A coterie of men as shrewd as he, and keener visioned because they lack his undoubted patriotism, capitalized their ostentatious devotion to him and sought valuable concessions in the same manner that such concessions are always sought the world over.

The fall of General Primo de Rivera, Mussolini's imitator in Spain, is not expected to be much longer delayed. Rivera has, like his Italian prototype, instituted needed reforms in Spain, but Spanish reverses in Morocco, which brought him into power, continued with distressing regularity.

Rivera made one mistake. Because of journalistic attacks upon his régime and pretentions he banished Professor Miguel Unamuno, one of the foremost of Spanish educators and authors, to the Canary Islands under conditions that made his exile painful as well as humiliating. Spain didn't seem to care until the world of letters denounced the outrage and then his release was brought about by a decree of amnesty.

In Spain, as in Italy, the dictatorship is supported by many who disapprove of its methods because the alternative is anarchy. In neither country is there an individual or a party regarded as able to continue the processes of orderly government should the dictatorship terminate suddenly.

For this very reason, as said before, the succession must be provided for if freedom is to be a reality.

Of Russia one always hesitates to particularize. During the closing year the Soviet government has been recognized by a number of countries, including England, France, Italy and China.

There is another development confirmed by both critics and defenders of the Moscow government. In the spring of 1921, after four years of determined effort to stamp out commercial trading on a money basis, the existence of merchants, Nicolai Lenin proclaimed the "New Industrial Policy"—the "NEP," so called, which allowed a limited amount and kind of merchandising. The innovation was regarded as a confession of the failure of outright communism—the provisioning of the populace by the state, who in turn gave their labor in exchange for the means of subsistence. The more radical Russian leaders accepted the move grudgingly, but Lenin dominated the situation.

Lenin died on January 21 of this year and since then reports from Moscow indicate that the forces of reaction are in the ascendency. The government has not been bold enough to abolish the "NEP" by an open decree, but has undertaken to undermine it by discrimination, excessive taxation and propaganda. The government subsidized "Co-operatives" have been advanced as the means of crushing the independent merchants and their losses due to underselling are made up by a state bonus.

This reversion to communism and the unfortunate episode of the Zinoviev letter seem to indicate that the Bolsheviki have learned little from the varied experiences.

In the Orient the civil wars in China require but brief consideration. Similar disturbances occurred in the previous year and are likely to recur in 1925.

In Japan the condition is different. Today she is smarting under the exclusion features of the United States Immigration Act, but cherishes another sense of danger. It will be recalled that a Russian relief ship, carrying supplies to the sufferers of the Tokio earthquake last year, was denied a landing because, it is said, the vessel also carried communistic propaganda. From time to time word comes that the ruling classes actually fear a radical revolution and that stern repression is sometimes resorted to to suppress its growth. The extent of this defection it is impossible to estimate. Of its existence there can be do doubt.

In the United States the early months of 1924 were marked by an unprecedented wave of Congressional investigation and political and personal scandal. A Senate committee found evidence that under the direction of Charles R. Forbes the Veterans' Bureau misused its funds. It so reported on January 9. Forbes was indicted in February, jointly with John W. Thompson, and on November 24 they were placed on trial in Chicago.

The celebrated "Teapot Dome" case has taken the same course. President Roosevelt set aside certain oil lands as reserves for the use of the Navy. Presidents Taft and Wilson refused to lease the lands to oil men but Albert B. Fall, Secretary of the Interior under Harding, induced Secretary of the Navy Denby to transfer these lands from the Navy Department to the Department of the Interior and leased one tract to a company headed by Harry F. Sinclair, the other to interests conrolled by E. L. Doheny.

A Senate investigation of these leases was ordered and the hearings before the Public Lands committee were often spectacular.

The Presidential campaign was enlivened by the entry of a third party which, justly or not, became regarded as dangerously radical. Although in the early weeks of the campaign it was thought that the electoral vote would be indecisive and it would devolve upon the House of Representatives, or possibly the Senate, to choose the next President, the ultimate result was the rallying of all the conservative elements to the present incumbent. It was not a partisan victory in any sense. Nothing is so dangerous as overwhelming victory. It tempts excess. The victors should remember this.

New Englanders Who Come From Afric Isles

Concluded from page 5

see, the Archipelago was constantly visited for crew men, "the best to be had," while the coal docks in St. Vincent annually bring many hundred visitors temporarily to the Archipelago. As early as the years 1842 and 1843 records show that 217 vessels entered Cape Verde ports —87 were United States registered, 61 were Portuguese, 36 English, 9 French, 3 Spanish, 1 Venezuelan, while the remaining 20 were listed as "Europeans." Today more than 3,000 vessels annually visit Cape Verde ports.

This historical inflow of white blood, probably predominantly Portuguese, and of Negro blood directly from the Guinea coast of Africa, has resulted during the lapse of 460 years in 185,000 persons in the Archipelago, according to a 1920 census.

The Cape Verders in America are not at all a homogeneous-appearing people. How many of them are entirely white there is no means of knowing. I talked with persons from the Island of Brava who apparently were of White ancestry, and I saw three children said to be of pure Brava parentage who had yellow hair and light-colored eyes. I saw several others, of Brava parentage, whose hair was fawn-colored, and others with medium-brown hair.

Cape Verders having Negro blood frequently differ distinctly from the American Negro—much, of course, as the latter people differ among themselves. They are taller than the white Portuguese. The face is often long and narrow, exhibiting more of the Mediterranean racial type, from their Portuguese ancestry, than characterizes the American Mulatto. The features, especially of the light-skinned women, are often distinctly delicate and slender, and the hair slightly wavy and brown. If one may attempt to distinguish the skin-color, it must be said to be distinctly more bronze in tone than black or brown or yellow. This is especially true of persons from Brava. I believe 5 per cent, or possibly 10 per cent, of the Cape Verders in America, could pass as white—as the American Negro says—"could cross the line." Many more, say 10 to 15 per cent, if resident in our Southwest, would not be judged as Negroes. While the others, anywhere in the United States, would be thought of as Negroes. The language spoken by Cape Verders is called "Creole." It is a bastard Portuguese, consisting mainly of sixteenth century Portuguese with many African words and phrases.

The Archipelago forms a single over-sea province of Portugal. The Franciscans went to the Islands before the close of the fifteenth century. They went, wrote an early chronicler, "to root out from this new vineyard of the Master the bad weeds which the African climate had produced there." Since 1867 certain educational work has been carried on. On all inhabited islands, excepting St. Lucia, churches and primary schools are now conducted by the government or priests. Some of the wealthier families send their children to Portugal for education. During recent years Cape Verde immigrants are said to be more literate than those received from other Portuguese possessions.

In the Dartmouth Historical Society's Museum in New Bedford are preserved some 500 logs of whaling and trading vessels. The average seaman's log, contrary to expectation, is not usually an interesting book—being a monotonous repetition of a tale of wind and weather. But certain information may be gleaned from them. A few short extracts from the museum log of the bark, *Susan Jane*, Charles H. Taber, captain, sailing from New Bedford July 26, 1862, for a six months' trading voyage to the Cape Verde Islands and the Island of Goree will serve to show the islands visited, the use of Cape Verders in various capacities on the vessels, and the ease with which they came on small sailing vessels to America. Some of the Island exports are also noted. The cargo taken from New Bedford was largely lumber and furniture—chairs being particularly mentioned.

The log was kept by the first mate, and is reproduced faithfully as far as spelling and punctuation are concerned.

At Porte Grande, St. Vincent, Monday, October 13, 1826. "This day begins with fine weather. Discharged some cargo unbent the Fly jib and bent another and took in the Kedge and Launch and got the ship ready for the Sea unbent the spanker to repair a man came on Board to work his passage to Brava So ends this day."

At Furna, Brava, Monday, October 28. "first part fin let the men go on shore on Liberty at sunset all came off got off 1 more cask of water at 9 a m Capt and supercargo Came on Board with others discharged Antone took 4 men to work their passage also a steward making 17 on Board Stowed off the stole took in the Launch so ends this day."

At Praya, St. Jago, September 3, "a man came on board as a hand." Sept. 4, "This day fine weather employed discharging lumber another man came on Board." Sat. Sept. 20, "Took on board 2 bar potatoes 1,300 oranges 8 bun Bannas." Tues. Sept. 23, "a cabin boy came on board."

From St. Jago the *Susan Jane* went to Goree, a small French island close to the west African coast, discharging lumber. She returned to the Cape Verde Islands and completed her home cargo.

At Sal, Nov. 5, "Took on Board 6 launches of salt."
Nov. 6, "7 launches of salt."
Nov. 7, "took on 3 lighters of salt."
Sat., Nov. 8, "took on Board a Launch Load of Copper and Composition and got some goat skins so ends this day."
Sun. Nov. 9, "This day strong Trades and hazy part of the Crew on Liberty."

At Praya, St. Jago, Nov. 29, "took on 51 bundles of goat hides and 6 bullock skins."
Dec. 2, "16 bags Coffee 28 bundles goat skins."
Dec. 3, "3 boxes 2 Bags Coffee 2 Bundles goat skins."

At Porte Grande, St. Vincent, Dec. 9, "took on Board 111 Hides 12 Bags Coffee."
Dec. 10, "63 Hides 5 Bundles goat skins 1 cask of old Copper and some lead."

The *Susan Jane* sailed from St. Vincent, December 11, 1862, directly for New Bedford where she arrived January 16, 1863. In the same log book is a record of a second trading voyage of the vessel, with the same captain, sailing July 1, 1863, for Cape Verde Islands, returning to New Bedford December 12 of the same year.

The second and concluding installment of this article will appear in an early issue.

Where Youth Lived Riotously on 30 Cents

Concluded from page 14

any cheaper, they'll have to *pay us to live here!*" On a dollar a day, the cost of a New Yorker's lunch, the native of any foreign country could live in luxury. German salaries, payable in marks which melted like dripping snow, were varying between four and six dollars a month, and often fell as low as two. The contrasts to be made were remarkable.

On the one hand, scurvy, which had not appeared during four and a half years of war and food blockade, crept into the universities. On the other, students from every European country rushed to the same universities, because it was possible to study in them at an expense of £3 a month.

The Dutch and Swiss in border villages sent their laundry to Germany for washing, at savings of 80 per cent; and at the same time, in Frankfort, in the writer's presence, a girl student burst into tears at the sight of her laundry bill; three times as high as any she had ever paid before. While the uncivilized portions of Europe were dumping their lowest elements (via Vienna) into Berlin, where they attached themselves, barnacle-like, to the failing economic structure, the most cultured and highest classes of pre-war Germany were suffering hardship of a kind and intensity not known since the days of the French Revolution. On every age and rank it left its indelible mark.

While Swiss shop girls were taking their vacations "in style," in Freiburg in the Bresigau, Stuttgart, Hannover, Leipzig, Dresden, and Berlin, and spending five francs a day to do it well, an exclusive Burschenschaft, or student's fraternity, of the University of Marburg, went en bloc into the coal mines at Hamm. Stricken by the blight which had fallen on all the professional classes, a doctor of international standing sold *wurst* at the Anhalter Bahnhof.

Retired physicians pawned their linen, suits of clothes, books, instruments, one by one, and finally succumbed, while a foreign scum carried in its pockets money enough to have supported whole German families . . . *made in speculations on the falling mark.* A professor, known before the war in every country and wherever students meet, played in the orchestra of a cheap motion-picture theater, while his baby starved to death and his wife died of tuberculosis. Currently, foreign tourists, and particularly the American, objected strenuously in the Paris newspapers to having to pay ten times as much as the Germans paid for admission to castles and museums, although the sums were less than a fourth of those paid by Germans and foreigners alike in 1914.

On May 1, 1923, the dollar was 31,000 marks; on June 1, 75,000; to start July 160,000. August began with a quotation of one million, and multiplied it by ten. On October 1, American exchange had reached the unbelievable figure of a quarter billion; which a month later was insignificant in comparison with that of a half-trillion; which in turn gave way, within four weeks, to the formidable notation of fifteen trillion. (Ultimate stabilization at 4.2 trillion was effected by the Rentenmark.)

Throughout the period described, as well as in the year preceding it, German railroad fares never were able to keep up with exchange. Today's 400 per cent increase in rates would tax the Germans dearly; but if next week the dollar went up 600 per cent, to foreigners tickets were cheaper than ever. Their transportation veritably cost nothing.

Forty-seven per cent of the population of the industrious city of Nuremberg was receiving support of some kind or other by October, 1923. The wages of its inhabitants might as well have been given out in ice or snow: overnight a bank note, worth a loaf of bread at the baker's, would shrink to the value of a roll, and in two days would not buy even a box of matches.

Side by side with German misery, from the war's end almost until 1924, sat foreign arrogance and wastefulness; the harder conditions became for German citizens, the better they were for their uninvited guests. It was in a frantic protest against such things as these that in November, 1923, prices rose until, even for foreigners, Germany was the most expensive country in the world.

BRIEFLY TOLD

Land and improvements to the extent of $150,000,000 are represented in the "made land" area of the lake district of Chicago. One of the largest office buildings in the world is nearly a half-mile out into what was once part of Lake Michigan. Hotels and huge apartment houses stand where once the fisherman plied his trade.

The Bureau of Biological Survey has declared war on the prairie dog. The tastes of the prairie dog are so similar to those of cattle that the two classes of animals cannot live on the same pasture lands, as drouth coupled with the prairie dog menace starves the cattle out.

The American flag which flew over Fort McHenry during the bombardment by the British and which inspired Francis Scott Key to write "The Star Spangled Banner" is preserved in the Smithsonian Institution at Washington. There were originally fifteen stars in the union but one was cut out and presented to President Lincoln.

In Tibet, respect to a thing or person is shown by always keeping it on one's right-hand side. In passing by any religious edifice it is proper always to pass round from left to right, "clockwise," which is also the direction in which the prayer-wheel should be turned. To violate this rule is considered an act of blasphemy.

North Louisiana is dotted with giant earthen tanks stored with crude oil. Wild ducks coming down from the North mistaking the oil for water alight in them never to arise again, as the thick oil clogs their feathers and weighs them down.

Wahabism is a Moslem reform taught some 165 years ago by a poor student of the Koran in Nejd and championed by the then head of the family of Ibn Sa'ud. The Koran, according to him, was to be interpreted freely by the individual reading it. Upon alcoholic drinks, tobacco, jewelry, the wearing of silk and the shaving of beard and mustaches he laid a strict prohibition.

The menace to navigation comes not so much from the brilliant ice peaks of the iceberg that are visible for miles, as it does from the great bulk that extends below the surface of the water. Seven-eighths of an iceberg is submerged.

Wars in which the United States has taken part since 1790, exclusive of the World War, have cost the nation more than $6,836,000,000 in pensions.

Hairpins were used seven thousand years ago. They have been excavated at Kish by the Field Museum-Oxford University Mesopotamian expedition. Among other things found were jewels of exquisite ancient workmanship, finely engraved cylinder seals of inestimable historic value, glazed pottery and inlay work of lapis lazuli and silver.

Fort Apache, Arizona, famous Indian military outpost of frontier days, has been converted into an Indian school.

The bureau of appointment of Yale finds that 1,354 students last year earned $382,206—an average of not far from $300 a year apiece.

Jewish immigration into Mexico has jumped from 100 a month to 200 and over, due to the wide publicity given the Calles speeches inviting the 10,000 Jews detained in European ports to colonize Mexico.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

"It isn't very pleasant to read of indictments in connection with promotion of fraudulent bankruptcies and find that nearly every one of the twenty-five or thirty who were indicted were Jews. It seems that we have some house cleaning to do among ourselves and it is high time that we started it."—*Charles H. Joseph,* Jewish syndicate writer, in Detroit *Jewish Chronicle.*

It is suggested that gasoline-burning vehicles be banished from Central Park and the leisurely victorias restored. Trees in Central Park have suffered from exhaust fumes of automobiles.

Dr. Johnson did not haunt the Cheshire Cheese Tavern and it is doubtful if he ever entered the tavern, according to Clement Shorter, historian and formerly president of the Johnson Club.

Wild cabbage still survives as a weed on chalky soils near the North Sea.

The United States Government pays slightly more than ten cents for each meal served soldiers. Three meals for each soldier cost the army 31.65 cents.

The climate of the Channel Islands south of England is so mild and land is cultivated so intensively, often under glass cover, that an acre suffices to support a family.

The germs of decay do not seem to affect linen. A piece of linen six thousand years old was recently examined in London and found as perfect as the structural linens of today.

A soaring airplane with movable wings has been built. It has a 20-horsepower engine and the inventor claims it capable of flying 50 miles on a gallon of gasoline.

Four hours' classwork, four hours' actual labor at one of a multitude of tasks, and daily Bible study are some of the features of the John E. Brown College at Siloam Springs, Arkansas. No student able to finance himself through any other institution is admitted. The school is interdenominational.

The mill in Windsor, England, where paper for bank notes has been manufactured since 1724, was founded by a French Huguenot. A family monopoly has existed in the industry since that time.

The old Bowery Mission, long known as "The Place Where Crooked Men Are Made Straight," was organized in 1879 by a little band of earnest workers at 55 Bowery, New York City, where the Gombossy Music Hall formerly had been domiciled. The enterprise first met with scorn and derision, but the persevering institution carried on in the face of opposition until today it stands as a respected haven of refuge.

Occasionally elephants of the circus that have become vicious have had their tusks sawed off without injury to the animal. However, practically all the ivory used in industry is taken from dead elephants and from nine thousand to twelve thousand are killed annually for this purpose.

Castles in Germany, the former homes of dukes and princes, which are now in the hands of the government, have become so numerous that officials do not know what to do with them. Some have been converted into museums and public buildings, but the majority will remain vacant unless they are purchased by wealthy foreigners.

There are 174,947 one-teacher schools in the United States with 3,500,000 children attending these schools.

The Bureau of Standards, after exhaustive tests, has announced that alcohol is the best material to keep automobile radiators from freezing.

A healthy adult may lose nearly a quart of blood before serious results become apparent.

When a Boston "hot dog" seller was fined three dollars for operating his stand in front of a lunch room on Berkeley street, he bought the entire building with savings, amounting to more than $12,000, which he had made from his stand in the last five years.

Drought, not frost, causes the leaves to fall in autumn. The sap is stopped causing the leaves to change color and wilt. The wilting, the changing to a brown or yellow or red, is not caused by freezing but by a drying out of the leaf moisture.

It would be possible for a railroad tank car of fresh milk to travel 3,000 miles and arrive fresh at the destination. A truck-tank of milk recently traveled from Pittsburgh to Milwaukee and after being on the road sixty hours the product was fresh and usable.

The oldest married couple in England have both celebrated, this year, their hundredth birthday. They were married sixty-three years ago.

A man works evil for himself in working it for another, and the wicked scheme is worst for him who devises it. ("Whoso diggeth a pit shall fall therein.")—From Observations of Hesiod, a celebrated Greek poet who lived about 800 B. C.

Lycurgus, a Spartan lawgiver and political economist, stopped the currency of the gold and silver coin, and ordered that the people should make use of iron money only. Then to a great quantity and weight of this he assigned but a small value. When this became current, many kinds of injustice ceased in Lacedaemon for no one would steal or take a bribe when he could not conceal the booty. The coinage was quenched in vinegar when hot to make it brittle and unmalleable, and consequently unfit for any other service.

How Old Is the Cross-Word Puzzle?

It Came From Greece, Went to France, Crossed to England, Jumped to New York—And Then It Grew! You Saw It Long Ago, But It Was Not the "Fashion," So You Passed It By

Story of Two Lucky Young New Yorkers—the Apotheosis of the Word Hound

By THOMAS L. MASSON

THERE is a man in South America (Paul Meierz) who is said to be working on a cross-word puzzle, declared to be the largest in the world. Up to the last account he was still at it. This cross-word puzzle was made by an Englishman. It is five feet square, made on parchment. Each square is three-fourths of an inch on each side. To ascertain the total number of squares in this cross-word puzzle is, therefore, comparatively an easy matter for mathematicians.

What is the cause of this craze which has swept over this country, and which now, apparently, is at its zenith? We must necessarily be cautious in our replies, yet the explanation which I shall attempt in this article—like the cocksure solutions of many of the expert puzzlers themselves—appears to me to be the only logical one. In the beginning, however, let us say something about the origin of the cross-word puzzle.

First, then, it is not new. For sever l generations, and very probably before that, the thin line of cross-word puzzles, in some form or other, has been unbroken. In this country as far back as the seventies, cross-word puzzles appeared in *St. Nicholas* regularly. Two examples are herewith given. One is merely the verbal form; the other is a variation of the present form of squares, in the shape of a cross. It is perhaps the best example of one of the earlier forms. The *Strand* magazine in England used these puzzles. Their origin can be traced back, apparently, to the tetragrammaton, or magic acrostic, used during the Middle Ages to drive away the devil. Indeed, this is not an inappropriate beginning for so worthy a weapon. For if we may now say that the devil stands for certain forms of ignorance, it would not be stretching the point very much to state that the present cross-word puzzle craze has been put into the hands of the American people as a weapon against too much mental atrophy. (And by the way, just as an aside, it is a great comfort in an article like this to feel that one may use all the big words one likes, without being accused of being a highbrow—for am I not addressing a large group of word hounds, in which the verbal sky is the limit?)

To pursue the thread of my narrative, it was not so long ago that various psychologists and mental engineers, after innumerable tests, declared that the average intelligence of the inhabitants of this country was only about that of fourteen years of age. They might have added, with truth, that this is the age when one knows the most. However, from their investigations was born the word moron. Sinclair Lewis, Theodore Dreiser, and H. L. Mencken promptly made it plain—each in his own terms—that they considered us a nation of morons. And now we have even bank presidents—who are supposed to be the lowest form of human intelligence—proving that this isn't true by solving from week to week some of the most difficult of the cross-word puzzles. The fact is, as Mr. Bryce long ago asserted in his "American Commonwealth," just when we are in despair about ourselves, the surprise occurs. "A hundred times in writing this book," he declares, "I have been disheartened by the facts I was stating: a hundred times has the recollection of the abounding strength and vitality of the nation chased away these tremors."

The brief facts about the present revival of the cross-word puzzle are simple and superficial and sensational. A year ago two young men in New York, Simon and Schuster, decided to go into the publishing business. They had no particular idea of just what they were to do. But one day, shortly after they had started, on January 1, 1894, Mr. Simon was called to the house of a young woman friend of his who was convalescing, and who asked him to bring along a cross-word puzzle for entertainment. Up to that time he had no knowledge of cross words. He went to Brentano's the bookseller's to get a book, and, like Old Mother Hubbard, discovered there was none. He recalled that he had seen cross-word puzzles in the New York *World;* it came to him that F. P. A., of the *World,* had had something to say about them in his column—in short it was plain that a small band of intellectual intimates—writers and so on—in the Metropolis had developed a kind of small-town fad in a very large town. It suddenly occurred to him that here was his chance to publish a book. But where could he get the cross-word puzzles?

He repaired immediately to the office of the *World.* In charge of the puzzle section at that time (and at present) was a young man named Prosper Buranelli. Simon stated his trouble. He was foolish enough to consider publishing a cross-word puzzle book, and wanted to know if they had anything on hand. Buranelli opened the lower and largest drawer in his desk, which was stuffed full of manuscripts. They counted 1,500 cross-word puzzles which had been coming in week after week from all over the country, and had been stuffed away in that drawer. Here, then, was a spontaneous something from somewhere which indicated a long-felt want. It was what the psychoanalysts call suppressed desire. All it needed was sublimination, or a release. Simon insists that he did nothing himself. He went where he was ordered and merely became the happy medium through which the cross-word currents flowed. They told him that the cross words had been a feature in the *World* for many years; nobody in the office had paid any attention to them. One week they left them out of the paper, either by mistake or as a test. And immediately they got so many "howls" from the band of fans who were doing the puzzles, that they received orders not to disturb their appearance again. Simon and Schuster got out their book. But these two young men were ambitious to be real publishers—they had lofty ideas, and so they determined to conceal their identity under the name of The Plaza Publishing Company. They took three editors of the *World* into their secret, however, and gave them a royalty, and the perpetually smiling faces of these three editorial confederates is now evidence of their prosperity. Simon told me that the edition of their books had gone over the 300,000 mark. In one day they sold 53,000 copies. This seems to be the only instance of a popular fad which has seized everybody alike. In New York, there is only one paper of any standing—the dignified *Times*—which does not issue cross-word puzzles daily.

In November, Dean F. Paul Anderson, head of the electrical engineering department of the University of Kentucky, announced a course in cross-word puzzles for senior students, declaring it not to be fad, but educational and a true mental stimulus. The Reverend George W. McElveen, of the Knoxville Baptist Church of Pittsburgh, not so long ago preached a sermon in which Proverbs 1, 10, "My son, if sinners entice thee, consent thou not," was blocked off in large letters for the edification of the congregation, who were invited to fill in the blank spaces. Professor Robert K. Root, of Princeton, also proposed a three-hour test of the most frightful puzzles in history. Apparently, in this country, Columbia University was among the first to use cross words, in connection with the course in psychology, but this is not authoritative.

In the Archeological Museum of Johns Hopkins University in Baltimore is a copy of what is declared to be the world's oldest cross-word puzzle. It is called the *Rhaestus Disk* and came from the Island of Crete. The disk is made of terra-cotta, both sides containing a continuous line of spiral writing. It never has been deciphered. According to Dr. Aaron Ember, associate professor of Semitic languages in Johns Hopkins, the cross-word puzzle did not originate in Egypt.

It is very much more likely to have been used in Greece, although I can find no definite evidence for it. Of course, from the beginning of time, in every group of inquiring people, there have always been a few who delight in puzzles. They like first to create a mystery, and then solve it. It is also quite natural that statesmen, or any men whose minds are taken up with weighty affairs, should turn to puzzles as a relaxation. Robert Lansing is declared to be a cross-word fan. Others are Mary Roberts Rhinehart, Kathleen Norris, Gelett Burgess (who has invented a number of cross-word puzzles), Admiral Sims, Cyril Maude, the actor, and Neysa McMein.

The cross-word puzzle is only a particular pictorial demonstration of a very old impulse; it is, in a way, an outgrowth of the anagram, which is very old. Socrates delighted in anagrams, and used them as a diversion from the discomfort of his wife's presence, if we may believe ancient gossip. The anagram consists, as doubtless everybody now knows, in the transposition of the letters of a word or phrase so as to form a new word or sets of words. One of the most recent anagrams was used by Samual Butler, in his book "Erehwon," which, read backward, is *Nowhere.* Shakespeare's Falstaff attacked ancient anagrams. The skeptic and true intellectual of his time, Pierre Bayle (1647-1706), pronounced all anagrammatists as wanting in taste and judgment. The Hebrews classed anagrams as cabalistic. They were common in Egypt and both Ptolomaeus Philadelphus and his Queen Arsinöe had their names anagrammatised:

There was an anagram made on the Mistress of Charles the Ninth of France,

MARIE TOUCHET
Je Charme Tout

And on the unhappy Mary Queen of Scots,

MARIA STEUARDA STOTORUM REGINA
Trusa vi Regnis, Mort Amara Cado

(Both of these defective).

These old anagrams become of great interest now as revealing the background of the cross-word craze. For instance, Crashawe the poet had a literary intimate of the name of Car, who edited his works, and thus came the anagram, HE WAS CAR. (Made out of the letters composing Crashawe.) From this came the following lines:

"Was Car then Crashawe, or was Crashawe Car?
Since both within one name confined are.
Yes, Car's Crashawe, he Car; 'tis Love alone
Which melts two hearts, of both composing one
So Crashawe's still the same," and so on.

The anagram came over to this country early in its history, revealed by Cotton Mather in his elegy on John Wilson:

COTTON MATHER

"His care to guide his flock and feed his lambs
By words, works, prayers, psalms, alms, and *anagrams.*"

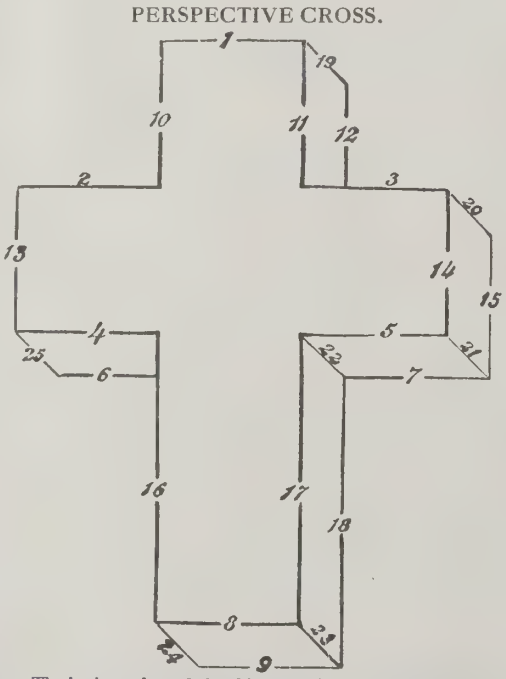
In a recent article on old Christmas Annuals, I called attention to the fact that Barry Cornwall was one of the principal contributors to the old *Keepsake.* His name, Barry Cornwall, becomes an anagram for his real name, Bryan Waller Proctor when the *Poet* is added, thus,

BRYAN WALLER PROCTOR
BARRY CORNWALL POET!

(Concluded on page 14)

Here is one of the earliest pictorial forms of the cross-word puzzle used in this country. It is reproduced from *St. Nicholas,* issue of December, 1878.

PERSPECTIVE CROSS.



The horizontal words in this cross have five letters each, except number 6, which has three. Of the perpendiculars, 16, 17, 18 have ten letters each, number 12 has three. All other perpendiculars have five letters each; the slanting words have three.

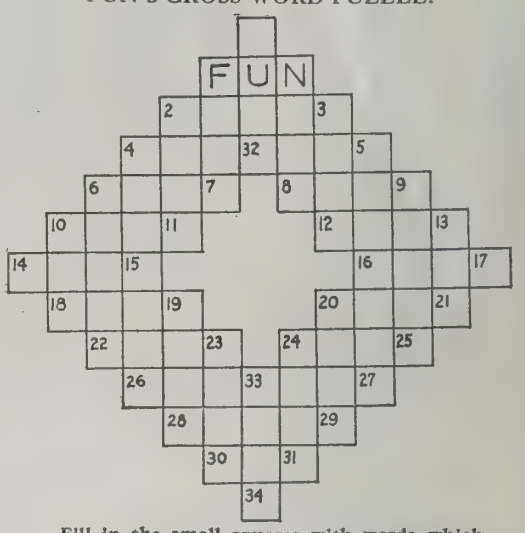
The meanings of the words are: 1. A wanderer. 2. To aim. 3. To hesitate. 4. A bird. 5. A color. 6. An animal. 7. A time of darkness. 8. To tend. 9. To intimidate. 10. A tale. 11. A Biblical king. 12. A jewel. 13. An organ of the body. 14. To exercise controlling influence. 15. A fish. 16. A scientific person. 17. A kind of dog. 18. Lowest. 19. An animal. 20. An animal. 21. A kind of fruit. 22. To execrate. 23. A point used in writing. 24. A boy's nickname. 25. A part of the body.

The answer is as follows, taken from the January (1879) issue.

PERSPECTIVE CROSS.—1. Nomad; 2. Level; 3. Demur; 4. Raven; 5. Brown; 6. Bat; 7. Night; 8. Trend; 9. Daunt; 10. Novel; 11. David; 12. Gem; 13. Liver; 14. Reign; 15. Trout; 16. Naturalist; 17. Bloodhound; 18. Nethermost; 19. Dog; 20. Rat; 21. Nut; 22. Ban; 23. Dot; 24. Ted; 25. Rib.

One of the first cross words, which appeared in the "Fun" section of the New York *World* on December 21, 1913:

FUN'S CROSS-WORD PUZZLE.



Fill in the small squares with words which agree with the following definitions:

2- 3 What bargain hunters enjoy
6- 7 Such and nothing more
10-11 A bird
14-15 Opposed to less
18-19 What this puzzle is
22-23 An animal of prey
26-27 The close of a day
28-29 To elude
30-31 The plural of is
8- 9 To cultivate
12-13 A bar of wood or iron
16-17 What artists learn to do
20-21 Fastened
10-18 Found on the seashore
6-22 What we all should be
4-26 A daydream
2-11 A talon
19-28 A pigeon
F- 7 Part of your head
23-30 A river in Russia
1-32 To govern
33-34 An aromatic plant
N-8 A fist
24-31 To agree with
3-12 Part of a ship
20-29 One

This is one of the easy ones. The answers to it appeared later in the New York *World,* but they are not given here as this is not considered necessary among so many present-day experts.

The World's Court—Why It Was Created

Functions Are Limited, and It Is Not a Cure-All for International Ills

By C. R. HOBART

MOST Americans are doubtless vaguely aware that there is in existence, somewhere, some such thing as the World Court; but the lack of definite knowledge and information in regard to this institution is very marked, as is shown by certain newspaper editorials and the utterances of some of our politicians.

The history of the World Court is bound up with the history of arbitration in general. It is difficult to say who was the originator of the idea that there should be a court for the nations just as there are courts for individuals. The suggestion was once made by Benjamin Franklin, but it is certain that his suggestion was not the first. At all events, the idea of settling international disputes by arbitration and conference rather than by resort to arms has undoubtedly had its greatest development in America. Our first arbitration treaty, the famous Jay's Treaty of 1794, was entered into with Great Britain.

The making of this treaty with Britain gave impetus to the idea of a general arbitration treaty, one which would include all, or at least the most important nations of the world. More than a century was required for this idea to bear fruit. In 1908 the first of the general arbitration treaties was made with France by our representative, Mr. Root.

After Jay's Treaty of 1794 and the proposals of general arbitration, the next really important stage in the development of arbitration came in 1898 when the Czar of Russia called on the various powers to attend a conference to consider disarmament. The suggestion did not meet with an immediate favorable response, but in 1899 a conference actually met to consider not only the question of armaments but also the question of revising the rules of warfare, and ameliorating the cruelties of war.

This first Peace Conference, which met at The Hague, was attended by twenty-six powers. The question of the limitation of armaments was deemed to be too large and complicated to be dealt with at that session, so it was put on the table for a future conference. Most of the time was spent in *elaborating* the rules of warfare. But in spite of the fact that the conference by no means attained its end, certain very desirable results were brought about. The most important of these was the indorsement by the conference of the idea of general arbitration. This idea, while broached at the conference by Sir Julian Pauncefote, the British Ambassador to the United States, was really the contribution of the American delegation.

It is worth while noting the language which Mr. Hayes used. He said:

"Nothing can secure for human government and the authority of law which it represents so deep a respect and so firm a loyalty as the spectacle of sovereign and independent states, whose duty it is to prescribe the rules of justice and impose penalties upon the lawless, bowing with reverence before the august supremacy of those principles of right which gave to law its eternal foundation."

Machinery for Arbitration

THE First Peace Conference at The Hague approved the idea of general arbitration, but no provision for a general arbitration treaty was made. No nation was, as a result of this conference, bound to arbitrate. Nevertheless, the machinery for arbitration was created; it consisted in a panel of judges selected by the various nations, which judges might be called upon to act as arbitrators in case of a dispute. The organization was "The Permanent Court of Arbitration for the Settlement of International Disputes." The name is misleading, however, inasmuch as the organization is not a court in the true sense but only a list of judges. And it is not permanent except insofar as the list is always on file at The Hague.

The Second Peace Conference convened at The Hague in 1907. Our delegates were again instructed, this time by Secretary of State Root, to use their efforts to bring about the development of The Hague Court into a really international tribunal; one which would be permanent, "composed of judges who are judicial officers and nothing else; who are paid adequate salaries; who have no other occupation, and who will devote their entire time to the trial and decision of international cases by judicial methods and under a sense of judicial responsibility."

This proposal was discussed, but no tribunal of a really international character resulted. The great difficulty encountered was to devise a plan for the election of judges, a plan which would meet the approval of the small and great powers alike. A court in which all the powers would be represented was obviously too large; and the small powers would not consent to have the judges elected from the great nations alone. The representative from San Domingo said forcefully that his country could never consent to become a party to such a court unless San Domingo had equal voice with Great Britain. The best that the conference could do was to go on record as favoring compulsory arbitration; and even this resolution, which had no binding force whatever, met with the strongest opposition on the part of Germany.

It was the intention of the parties to meet for a third conference in 1915, but this date came at a time when most of the world was at war. Of necessity the task of creating an international court had to be postponed until the conclusion of hostilities. But the idea which had been growing all these years only received added impetus by reason of the events of the World War. Consequently, provision was made in the League of Nations Covenant for the future creation of a World Court.

The Constitution of the Court

SINCE there has been so much talk about the World Court and arbitration, it would perhaps be well at this point to distinguish between the two. The aims of arbitration and judicial settlement are, in the long run, identical, namely, the settlement of international disputes by peaceful means rather than by resort to war. It is in the methods employed that the two systems differ.

In a case of arbitration it is usual for the two countries first to reach an agreement to submit their difficulty to arbitration. Next each country selects an equal number of judges. These in turn sometimes select a third judge or group of judges who are presumably neutral. Finally, the evidence is submitted, the arguments heard, and a decision is reached. The result is invariably a compromise, a balancing of interests, a giving up on both sides, sometimes regardless of the right or wrong of the position of the parties.

The method of judicial settlement is somewhat different. A court is already in existence, ready to act whenever a controversy may arise. The judges are not politicians nor diplomats, but men skilled in the law. Presumably they represent no special interest. They have been selected because of their impartiality before the controversy has arisen. The decision of the case is arrived at, not by considering the strength or weakness of the opposing parties, nor the special interest of the judges, but by an examination of the principles of law involved in the case. The result is justice as opposed to compromise. It must not be assumed, however, that arbitration and compromise are necessarily unjust, or that arbitration is undesirable.

In accordance with the provisions of the League Covenant, a World Court was finally brought into being. The plans for the court were prepared by a committee of experts in international law, of whom our Mr. Root served as a member.

Now for the details of how the court is constituted and how it works. Details are usually tiresome, but they are almost always important. The World Court, or, officially, the Permanent Court of International Justice, is composed of eleven judges and four deputy judges. The method of selecting judges which had prevented the formation of a World Court at the earlier Hague conference was overcome by providing that the judges should be elected by the council and the Assembly of the League of Nations, from candidates proposed by those states that are members of The Hague Court of Arbitration, or are members of the League. The former provision, of course, includes the United States. Only one man may be elected from any one nation. This solution seemed to meet the objection of both the small and the great powers, because all have a chance to propose and to vote for the candidates; and the judges are elected, not because they represent a certain nation, but because of their fitness for the office. At the first election the following judges were selected: Loder (Holland); Weiss (France); Altamire (Spain); Anzilotto (Italy); Barbosa (Brazil); DeBustamente (Cuba); Lord Finlay (England); Huber (Switzerland); Moore (United States); Nyholm (Denmark); Oda (Japan); Meichman (Norway); Neguelesco (Rumania); Whang Chung Hai (China); and Yovanovivh (Serbia).

It will be seen from the above list that fifteen nationalities are represented on the court, which include the principal languages of the world, the main forms of civilization, and the important systems of law. Students of international law recognize at once in this list the names of the world's leading authorities, particularly the name of John Bassett Moore, America's best-known writer and teacher of international law. Mr. Moore's election was not due to American influence, because America, not being a member of the league, did not vote in the election of the judges. The selection of Mr. Moore is, however, a tribute to America, and it is also an indication of the impartiality with which the judges are chosen.

The World Court meets once each year, and can hold special sessions if necessary. A committee of the court (called a "Chamber of Special Procedure") is always ready to sit at the request of the parties. This chamber deals with questions which demand immediate attention. The court is open to hear controversies between nations; consequently the parties must be states and not individuals.

What kinds of controversies or questions are likely to come before the World Court? The court has jurisdiction to deal with disputes in two sets of circumstances. First, two states may agree to submit a dispute to the court for judgment. Secondly, a state may sometimes compel another state to appear before the court, where an existing treaty between the two nations provides for the submission of such disputes to the court, or where the two nations have accepted the jurisdiction of the court as compulsory.

In connection with the latter statement, it should be mentioned that the men who drew up the project for the World Court thought that jurisdiction should be compulsory; that is, that a state should be haled willy-nilly before the court, just as in civil life a defendant who has been served with notice of a suit against him is bound to appear and defend, or have judgment rendered against him. Strong objection was raised against this idea, however, particularly by the larger nations, and it was finally decided that states by signing a special agreement could bind themselves and each other, without other special agreement, to submit certain classes of cases to the court—questions such as the interpretation of a treaty, the breach of an international obligation, damages, and so forth. Those nations which did not sign this compulsory clause are, of course, not bound. Up to this time some twenty-odd nations have signed the special protocol, but none of the nations so signing has been a great power.

Not a Cure-All

PREVIOUS to the session of 1924 the court had heard and dealt with nine cases. A review of these cases and the facts leading up to each is beyond the scope of this article. It is sufficient to say that each case was very carefully considered and decided in accordance with legal principles, and the result reached in each case has been satisfactory. The official reports of the court's activities during the present session are not available.

The old court of arbitration at The Hague has not been extinguished by the creation of the new court.

The questions which can be decided by the World Court must necessarily be of a legal nature. Its field of activity is, therefore, rather limited. It is not a cure-all for all the diseases of the body politic. The majority of the questions which are now harassing the world are not legal questions, and are hardly susceptible of a legal solution. On the contrary, they are political, social, and economic in nature, and as such must be solved by other means than by recourse to the World Court.

The fact that the World Court can only deal with a very limited class of situations is often overlooked by the advocates of world peace who are urging that the United States participate in the World Court. They think, evidently, that this is the one step needed to bring about world peace and solve all of the international problems. But as the court is constituted at present, the United States could become a party to a suit without accepting membership in the court. American civilization and the American system of law and justice are represented in the court by the American judge, John Bassett Moore. We have the right to nominate candidates for the court. What then would be the effect, either in the United States itself, or in the world, of our decision to subscribe to the World Court Convention? It is probable that the difference would not be felt at all in this country. As far as other nations are concerned, our entry would without doubt greatly strengthen the court by adding moral support and increasing general confidence in its stability and usefulness. By becoming a member of the court we could also participate in the election of judges, a privilege which may in the future be of more importance than it is at present.

But neither the World Court nor our participation in the world tribunal will insure peace. As was remarked by Mr. Politis, the former minister of foreign affairs of Greece, "It is argued that justice will usher in peace because it will end war. It is rather the contrary which is true. The reign of justice presupposes the reign of peace. In an atmosphere saturated with passion, with rivalries and a war-like spirit, the judge is powerless; for the *RIGHT*, which is the judges arm, loses all value before force."

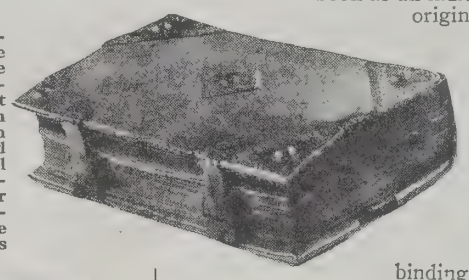
Royal Books and Their Rich Bindings

Bible on Which Kings and Queens of England Took the Coronation Oath; Bluff King Hal Was a Lover of Fine Books Artistically Embellished

By LOUIS C. KARPINSKI

IN FORMER days kings and potentates were accustomed to having a considerable amount of spending money. In consequence the royal encouragement of the arts and crafts was possible. In particular the monarchs found it highly desirable to encourage the art of bookmaking and bookbinding. This gave the air of learning to the royal house and made considerable impression upon the common people and even upon the learned. Quite recently the learning of a monarch who now seems to occupy himself with woodchopping, a healthy exercise, was the subject of frequent comment.

The outside of the royal books evidently engaged the attention of their owners even more than the inside and so we have some of the finest specimens of bookbinding emanating from the royal libraries which, like those of the commoner run of mankind, have frequently been sold in the book markets of the world, in London and New York.



Left—A portion of a tenth-century manuscript of the Bible used to bind three sixteenth-century works included in one volume. Right—An American psalter in German. Published in Philadelphia in 1781 and bound there. The metal ornaments are more common on larger books. Center—"Evangeline," by Longfellow. On the cover are eleven exquisite miniatures in ivory, set in the cover.

The book upon which the kings and queens of England from Henry I to Henry VIII took the Coronation Oath is a typical specimen of binding with metal reinforcements, which were in vogue up to the seventeenth century and even later in America. This book contains the gospels in Latin, written in the twelfth century. The leather binding is deerskin covering thick wooden boards. The lower cover contains a panel, sunk in the wood, upon which reposes a crucified figure of our Lord cast in bronze and ornamented, originally with gilt. The corners are protected by embossed pieces of brass, stamped with the fleur-de-lis within a circle. The rounded knobs upon which the book rests show encouraging signs of wear which suggest that the book may have been read by its owners. There is a clasp of leather and of brass as such old books were commonly kept closed by clasps.

King Henry VIII was a lover of fine books and the specimens from his library are ornamented with his coat of arms with subsidiary crowns over double roses. The kings were evidently fond of the "kingly crown," at least for decorative purposes on books and china, if not for regular headgear.

The Arabs are constrained by the Koran not to use for ornamental purposes any representation of man or animals. Probably for this reason the Arabs carried geometrical filigree designs to a very high degree of perfection. Many of the European bindings of the seventeenth and eighteenth centuries are obviously either imitations of Arabic designs, or, at the least, directly traceable to Arabic influence.

In placing a binding upon a book it is necessary to have some stiff material upon which the leather or paper may be stretched. At the present time this material is commonly cardboard. Formerly thin wooden boards were used and particularly in early American bindings the backing of the leather is of wood. Occasionally a binder would have on hand some older manuscripts, on vellum, perhaps, or some books which had become (in the binder's opinion) obsolete and this material would be used for backing. Some extremely important maps have been found concealed in the bindings of old books. Recently at the New York Public Library some early specimens of the printing of William Bradford, first printer of New York and also of Pennsylvania, were found hidden inside the covers of old books and some of these happened to be specimens not preserved elsewhere.

Many old manuscripts were written on vellum or parchment, itself suitable for binding. It is quite common to find old books bound in parchment containing some fragment of a biblical manuscript or a religious tract of early times. Such works were most common in the days before printing largely because education was so completely in the hands of the church. To copy a portion of the Bible was an act of devotion and possibly occasionally of penance.

Not only the covers of the finer books are decorated but even the margins. In ancient libraries the front edge and not the back of the book was exposed on the shelves. At first simply an ordinary decoration appeared upon the margin, gilt as we have it today. The marbled effect which continues in use is also a fairly ancient procedure. Another development which is quite unique is the painting of a picture upon the fore edge in such a way that when the books closed only an ordinary gilt edge appears but when the leaves are flexed a pastoral scene or some other painting appears. Success in this difficult art of fore-edge painting is attained only by the elect few. The cost of such a painting is rarely less than one hundred dollars.

In the finest bindings the inside cover continues with the same type of decoration as the outside of the binding. With extremely rare books it is highly desirable to protect them somewhat from the changes in the atmosphere by inclosing within a case. The real book-lover prefers the old original vellum binding of a rare book as an indication of age and as being the original state in preference to any modern embellishment. However, the book is inclosed in a case which bears considerable resemblance to a jewel box, often being lined with velvet so that there should not be any wear on the cover in placing the rare book within its case.

Another popular form of binding was the embroidered cover, wrought by the devoted fingers of some fair lady. Such a book could well be used as a pillow when weary of reading. This binding may have owed some of its popularity to the fact that books have been known to be used as missiles in the hands of a fair but irate reader. Obviously one would prefer to be impressed in this manner by a cloth-bound book. Today women have found other means of self-expression at the polls and in the professions, and where not? In any event, whatever the reason, this binding has disappeared, despite its numerous advantages.

The best bookbinders who have established reputations "sign" their bindings by placing the firm name in gilt lettering on the inside edge of a cover.

Occasionally enthusiasts for bindings even insert jewels or wonderful miniature paintings as added decorations to the book. Recently there was sold in New York the library of the late Mrs. Phoebe Doyle, of Brooklyn, which contained sumptuous jeweled bindings and inserted miniatures on ivory. With respect to ornamentation these books constituted a collection the rival of any royal collection. However, the prices did not rival by any manner of means those paid, for example, for the original manuscripts of the late Joseph Conrad. The book-buyers of today are far more interested in content than in the accident of dress.

In olden times books were far more costly than they are today. In consequence, it was customary to add chains to the books which may account in some measure for the further use of metal protection pieces. Such chained books are found today as curiosities in many old libraries of Europe.

The oldest books were the rolls used by the ancient Hebrews and by the Romans. The protection for such rolls was a cylindrical container with a tight-fitting cover. Caesar and Cicero undoubtedly carried several such pails of books with them on their journeys.

Today books are no longer chained. The binding in quantity production has attained such a degree of perfection that for 10 cents one may find a classic by Tennyson or by Browning or by Longfellow bound in leather. Never in the history of the world were books easier to obtain and while possibly not prized so highly yet never were books so widely enjoyed, and so great a blessing to mankind.

The legal work of Justinian, 1578. Bound for Queen Elizabeth.

A manuscript Bible upon which the Coronation Oaths were taken from the time of Henry I to Henry VIII.

An embroidered cover with coat of arms—a copy of Petrarch, printed at Venice in 1544. This cover is said to have been the work of Queen Catherine Parr, one of the numerous wives of King Henry VIII.

Vladimir de Pachmann, Passing of Eccentric Genius

By EUGENE LEUCHTMANN

THE king of color and nuance, master of tone-painting, is passing. Vladimir de Pachmann, on a last tour through the United States, is leaving behind him memories of richly colored recitals, and of one of the most eccentric and vigorous personalities in the world of music. He says farewell to America to spend the rest of his days at his home in Rome.

Never a virtuoso in the fashion of the thunderers, De Pachmann possesses facile technique, marvelous dexterity, and plays with an unparalleled beauty of tone. When De Pachmann plays he weaves enchantment about his audiences with the doleful music of Chopin. In the work of other composers, however, the shortcomings of his method are apparent—they prevent him from playing in the fiery, passionate manner of the poets of the piano. He cannot even give the proper value to his own Chopin's "Military" Polonaise; because of his lack of fire he plays it in the manner of a schoolgirl, albeit with faultless technique.

His audiences usually are huge, many being attracted more by the man's reputation for eccentricity than by the artist's marvelous tone and digital fleetness. But De Pachmann is not a showman, he is first of all a musician with the musician's thorough understanding and sympathy with the music of the man he idolizes. Hardly more than five feet tall, barrel-chested, De Pachmann makes an extraordinary to-do about the heignt of his piano stool, gazes about upon his audience, and twists his wrinkled, gnome-like face into smiles as he makes sallies against his enemies and against his own playing. But he never keeps an audience waiting, and his concerts are noted for the purity of the music that he plays.

An assiduous student his whole life long, De Pachmann thoroughly exploits the value of the music of his choice, long before he presents it in his concertizing. When it is below the standard he has set (and that standard is really high) he refuses it place on his programs. Sometimes he refuses to play in public music which he considers beyond the comprehension of concert audiences. The compositions of Leopold Godowsky, whom he considers the greatest of all modern composers, are placed in this class. No doubt the public would greatly enjoy these works from the piano of De Pachmann, for his insight and artistic evaluation of musical values would place to best advantage a music, the difficulties of which are polyphonic rather than technical. When his music has more than one voice, De Pachmann plays all with smoothness and suavity; in his playing of Chopin's Sixth Prelude, Opus 28 (B Minor), the bass sings with the sweetness of a cello, and the treble with an equal purity and grace.

"I shall play Godowsky's music when I return to Rome," said De Pachmann; "America and the rest of the world are not ready for it yet. It is too difficult to comprehend, and in Rome I shall play Godowsky for the critics, who are the best in the world. Here they say that I am boasting, that only my ego is making me say that I am the greatest. I have no ego. I am an old man now, seventy-six years old, and it is only in the last seven years that I have been an artist. For sixty-nine years I merely played the piano. When I invented my system I became the greatest."

De Pachmann's system dispenses with all lateral movement of the wrists. He plays with a stiff wrist, and his fingers are the secret of his wonderful tone, his marvelous music painting. He is incapable of the fire and dash that Liszt requires. At a recent recital, it was an emasculated Liszt he gave us, a Liszt without the fiery passion that flares and crackles in his music.

"Perhaps you believe that I alone think I am the greatest of all pianists," De Pachmann told the writer after the recital. "Let me tell you a little story. Just forty years ago I gave a recital in Budapest. Liszt was in the audience, and with him was one of his numerous countesses, this time a famous beauty. I played none of his music, but when I had finished he walked up on the podium and embraced me.

VLADIMIR DE PACHMANN.

"'You are the greatest pianist in all the world, my son,' Papa Liszt told me.

"'I am not so great as Liszt, master,' I said, because I knew that I was not, but time has shown that I am, and in the last few years only have I realized that I am no more a mere pianist, but the greatest artist."

As he plays, De Pachmann mumbles to himself, sometimes addressing the listeners in his audience. Before he starts his program he softly runs his fingers over the keys, stopping here and there at a note which he sounds three or four times, depressing the pedal to make it ring. He listens intensely to the sound, waves a long forefinger in the air in time with the reverberation of the note. He smiles approvingly at the audience.

De Pachmann plays true to the Chopin tradition. His art is that of the sickly and delicate Chopin, and the world has never heard, since the death of the Polish genius, an interpreter who has so closely attained to the Chopin ideal. At seventy-six, De Pachmann is still a virtuoso, with the digital fleetness of Moritz Rosenthal or the late Ferruccio Busoni, but with touch and tone that neither of them was capable of developing, and outranking them all in a poetic temperament that has the lyric, sequestered Chopin quality.

Who can say that when De Pachmann plays Chopin he is not the greatest pianist in all the world? He tells himself that, and believes it with all the naïveté and sincerity of a man who no longer deludes himself with self-esteem. When he plays a beautiful scale, a run, an arpeggio, with a touch of velvet and crystal clarity, he says, "Bravo, Pachmann! Angelic, superb!" But he would also say it if another played it with the same beauty and tone. He praises not De Pachmann, but the wondrous music which De Pachmann alone can make.

Aged, chastened, De Pachmann yet retains the undiplomatic dogma of telling what he thinks to the world, even in the concert hall. His asides are no longer stinging and cruel. They are introspective now, and expository of the music he makes. The De Pachmann who cursed Huneker, his host, because there was no cognac to finish up a dinner the incomparable critic had planned with great trouble—the pianist who refused, because he was not to have his "petit verre" after dining, to play Huneker's piano because he "had no contract to play that make of piano," and who was appeased with a thimbleful of the liquor (he is a most temperate man) after Huneker had searched the neighborhood for it—the De Pachmann of long ago is mellowed, balanced.

He is more tolerant, though he still hates pose and hypocrisy. He knows he is great, but it is with the knowledge of a man who is able to stand away from himself and hear his own music with unbiased mind.

Sir James Barrie's "Reminiscences" of Great Men

Sir James Barrie seldom makes a speech. His address on "Courage" when he became Lord Rector of Edinburgh University was, it is said, his second offense in a long lifetime. Given at the ninety-seventh annual dinner for the Printers' Pension Fund in November; as whimsical as Peter Pan—one of his brain children—his address was a "take-off" on the modern style in reminiscences. Of course, his references to Robert Louis Stevenson and Napoleon are sheer fooling. But his cracks about modern literature, and his delicious closing sentence, are of the quintessence of Barrieism.

SIR JAMES BARRIE, who was received with loud cheers, said:—Major Astor, your Royal Highness, gentlemen—especially Mr. Churchill (laughter),—What worries me is those two suspicious objects that have been put upon the table in front of me. (Laughter.) [Two microphones had been placed on the table to broadcast the speeches.] I do not know what they are, but I presume that one of them represents Literature, and the other the Press. (Laughter.) I think we should all feel very beholden to an eminent politician for coming here and talking to us so delightfully about literature and the Press, especially at a moment when the country is on the eve of a General Election (laughter)—I mean to vote this time. (Laughter.) But, though Mr. Churchill has been very nice about it, I know the real reason why I have been asked to reply for this toast. It is because I am the oldest person present. (Laughter.) Many years ago I saw, in an American "Whitaker," my name in a list, headed "Interesting octogenarians" (loud laughter), and I think therefore that the best thing I can do is to give you some literary recollections of far past days. (Laughter and cheers.) I dare say I may sometimes get a little muddled between past and present, between father and son, but then I notice that you have done that also tonight. (Laughter.) You have been congratulating Mr. Churchill on being Chancellor of the Exchequer. Of course, it was his father who was that. (Laughter.) I will tell you a secret—I know quite well what has been happening to Mr. Churchill, and I think that he is only wearing the laurels that he has so splendidly earned. (Cheers.) But let us couple with him tonight the father (cheers), who must be proud of his boy. (Hear, hear.)

Those of you who are at present writing your reminiscences, and that must mean the greater number of you (laughter), I warn you that there is not much use having reminiscences nowadays unless you can remember Robert Louis Stevenson. (Laughter.) The only time I met Stevenson was in Edinburgh, and I had no idea who he was. It was in the winter of '79. I well remember the wind was "blawin' snell" when I set off that afternoon with my notebooks to the Humanities class of the University of Edinburgh. As I was crossing Princess street—a blasty corner—I ran against another wayfarer. Looking up, I saw that he was a young man of an exceeding tenuity of body, his eyes, his hair, already beginning to go black (laughter), and that he was wearing a velvet jacket. He passed on, but he had bumped against me, and I stood in the middle of the street, regardless of the traffic, and glared contemptuously after him. (Laughter.)

He must have grown conscious of this, because he turned around and looked at me. I continued to glare. He went on a little bit, and turned round again. I was still glaring, and he came back and said to me quite nicely: "After all, God made me." (Loud laughter.) I said: "He is getting careless." (Renewed laughter, and cheers.) He lifted his cane, and then, instead, he said: "Do I know you?" He said it with such extraordinary charm that I replied, wistfully: "No, but I wish you did." (Laughter.) He said: "Let's pretend I do," and we went off to a tavern at the foot of Leith street, where we drank what he said was the favorite wine of the Three Musketeers. (Laughter.) Each of us wanted to pay (laughter), but it did not much matter, as neither of us had any money. (Laughter.)

We had to leave that tavern without the velvet coat and without my class books. When we got out it was snowing hard, and we quarrelled—something about Mary Queen of Scots. (Laughter). I remember how he chased me for hours that snowy night through the streets of Edinburgh, calling for my blood. (Laughter.) That is my only reminiscence of R. L. S., and I daresay that even that will get me into trouble. (Laughter.)

A NAPOLEON REMINISCENCE.

It may interest Major Astor to know that I was the man who bought the first copy of *The Times* containing the news of the victory of Waterloo. (Laughter.) I happened to be passing Printing House square at the time, and I vividly remember the Editor leaning far out of his window to watch the sales (laughter), and I heard him exclaim exultantly, "There goes one copy, at any rate!" (Laughter.) Waterloo! I never knew Napoleon in his great days (laughter), but I chanced to be lodging in the same house that he came to, as you remember, as a stripling, just for a week, when he was trying to get a clerkship in the East India Company. (Laughter.) The old connection between France and Scotland brought us together. I remember well taking him one evening to Cremorne Gardens, then at the height of its popularity, and introducing him to a stout friend of mine, whom some of you may remember, Jos Sedley. What fun we had in the fog driving Jos home in his coach to Russell square! Napoleon was singing gaily, and Jos was bulging out of both windows of the coach at once. (Loud laughter.) This is perhaps only interesting as being the first encounter between these two figures, who were afterwards to meet on the tented field. (Laughter.) Napoleon, as is now generally known, did not take up that clerkship in the East India Company. (Laughter.) I dissuaded him against it. (Loud laughter.) Looking back, I consider that this was one of my mistakes. (Laughter.)

Gentlemen, the unenviable shades of the great, who have to live on here after they have shed this mortal tenement! Not for them the dignity of dying and being forgotten, which is surely the right of proud man! Who knows that where they are fame is looked upon as a rather sordid achievement? The freer spirits may look upon those immortals with pity, because they have to go on dragging a chain here on earth. It may be that the Elysian Fields are not a place of honor, but of banishment!

"Literature and the Press!" It is a noble toast, and never can it be drunk more fittingly than in the honor of the best friend that literature and the Press ever had—the printer. (Cheers.) All seems well with the Press. We are gathered tonight round a chairman not unconnected with a journal of which we can perhaps say, without vainglory, that it is a possession which all the nations envy us. (Loud cheers.) The Press nowadays, as Mr. Churchill has said, takes all the world in its span. I cannot look at Mr. Churchill, because I have been told to look at these two things [the microphones] (laughter), but one who was very lately a Lord Chancellor, and now another, a Chancellor of the Exchequer, have both—I do not know whether Mr. Churchill is beginning to look a little nervous about what I am going to say next (laughter)—all I am going to say is in glorification of the Press—when it is garbed in its Sunday best (laughter)—they are the two brightest jewels on its proud bosom.

Literature, when it can be heard at all above the syrens—Mr. Churchill has had a good deal to say about literature and the Press, and has found that they are very much the same thing. He used an expression about there being no arbitrary dividing line between literature and the Press. I should like to give a definition of what I think is the arbitrary dividing line (laughter) just in half a dozen words. It is this—Literature used to be a quiet bird. All, I think, is very well with literature, especially with the young authors. From its looms comes much brave literature, devised by cunning hands, women's equally with men's. There is no question whether a woman is worthy of a place in our Cabinet. Those young authors! All hail to them! Happy they! Multitudinous seas incarnadine boil in their veins. They hear the thousand nightingales which we once thought we heard. They have a short way with the old hands, but in our pride in them we forgive them for that. (Laughter and cheers.) Perhaps they sometimes go a little to excess, treating even God as if He were, shall we say, the greatest of the Victorians. (Laughter and cheers.) I thank you for listening to me so patiently. (Loud cheers.)

About Boston's Old Red Brick State House

Cheery, Jaunty, Old Building Where Pages of History Have Been Written

By MAY B. WHITING

THERE is something cheery and jaunty about Boston's Old State House that the new one, with scarcely a century and a quarter passed over its head, can never attain. Instead of severe marble and classic Bulfinch front, the old red brick is warm and mellow, the myriad little windowpanes blink knowingly in the sunlight, and on either side of the peaked gable the gilded lion and the unicorn rise up bright and perky.

And then there is the jolly little balcony overlooking Washington street, yet just a few steps withdrawn, an ideal place for wraiths of former days to watch the passing show. Here must come, I think, the eleven royal governors who have presided on that spot, Endicott in his somber robes, Andros, soldier of fortune, a little pale with premonition of his fall, and Shirley in his velvets and laces. With them is another group, the Mathers, John Hancock, the pink of fashion, with his friend, Sam Adams, and in that august company the malevolent countenance of one Captain Kidd.

The first Town House was built in 1657 on the site of the Market Place, and only a few steps away from the home of its donor, Robert Keayne, merchant tailor and first Captain of the Ancient and Honorable Artillery. Captain Keayne seems to have been a prototype of the popular "leading citizen." He made a great deal of money in business, so much that he was arrested and closely questioned; he was exceedingly pious in his daily life, and, at his death, made numerous public bequests. In fact, his will is the longest ever recorded in the county, covering fifty-four closely written pages.

Captain Keayne said definitely just what rooms the new building was to contain, a place for the artillery, a walk for merchants and shipmasters, a library, and rooms for the courts, but, prudent soul that he was, he did not leave a legacy large enough to furnish them all, so subscription papers were circulated. One of these documents is today in the possession of the Bostonian Society, and it shows how the citizens gave of what they had, money, labor, straw, food, or "lighterage," a word whose meaning is unknown, for its building.

In 1658 the Town House was completed, an imposing edifice to greet the visitor as he approached the village from Long Wharf. Unfortunately there has not yet been found an authentic drawing of it, but John Josselyn who was in Boston in 1663 gives a good description. He says that it was set upon twenty-one pillars, ten feet high, and that it projected three feet beyond them, that the roof sloped on all four sides and was surmounted by two cupolas or turrets, and that there was a belfry and sundial. Just across the street was First Church, with its thatched roof, and, nearby, on Crooked Lane, now Devonshire street, lived the first pastor, John Wilson.

Endicott was the first governor to preside at the council table, and nine governors followed him in the old Town House, including Bradstreet, the last under the Colonial Charter, and Andros, faithful servant of James II, hated in his day but adding a vivid, picturesque note to Colonial history. Then came the Provincial Charter and, under that, Phips, Stoughton, Bellomont, and Dudley.

During these years the records of Boston are full of references to the Town House, and no part seems to have been more generally used than the "Library and Gallere for Devines and Schollers to meete in." Captain Keayne had asked that the pastor and teacher of First Church select from his own collection such volumes as were suitable for public use, making special note of his "3 great writing bookes which are intended as an Exposition or Interpretation of the whole Bible, as also a 4th great writing booke which is an Exposition of the Prophecy of Daniel," all of these books being "written with my own hand as farr as they be writt."

In 1702 John Barnord was ordered by the town to make a catalog, and, for his trouble, he was to choose two volumes. When flames swept the building the citizens eagerly strove to save the library, and with some success, it seems, for two years later the Selectment printed an "Advertizment" ordering all persons who still had in their possession the town's books to restore the same promptly.

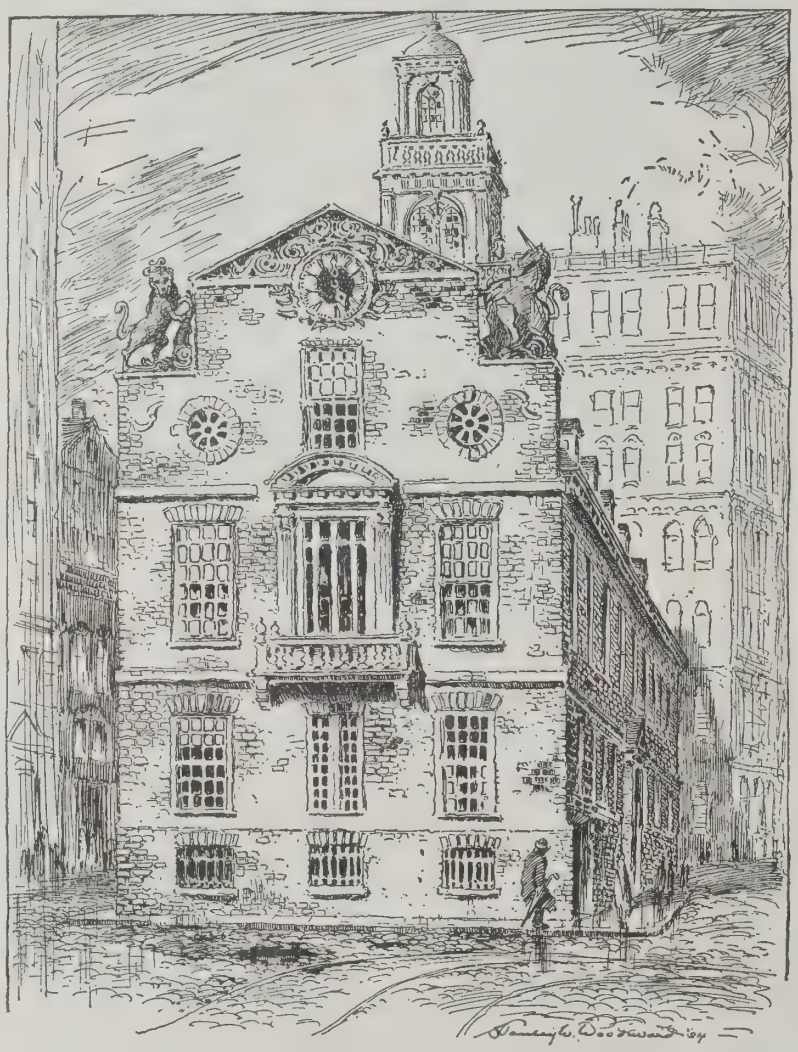
In 1686 Governor Andros landed in Boston and, in "scarlet coat laced," was conducted with considerable pomp to the Town House. Then began a struggle, the intensity of which we can only glimpse. Andros was determined to establish the Anglican worship in Boston and demanded the use of one of the churches. To his amazement a committee of five refused point-blank, because "it did entrench upon their conscience."

He was finally given the "east room" and, in those narrow quarters, with "movable pulpit and twelve forms," his friend Ratcliffe read of "the Blessed Martyrdom of Charles I" to such as desired his ministry. Just twenty-eight months after his arrival Andros stood in the Town House, a prisoner, and his downfall was proclaimed by "sound of trumpet and beat of drums."

In 1699 Captain Kidd came to Boston and, with his wife and a servant, put up at the best inn in the town. For years he had been a notorious pirate, and then was commissioned to put an end to piracy. But the temptation of his trade was too great, and Governor Bellomont, whose relations with the buccaneer had not been of the clearest, was forced to demand an explanation. He was tried in the Town House, and in spite of suave denials and failure to find the treasure which he was reported to have hidden, he was found guilty and sent to England for sentence.

In 1711 the Great Fire completely destroyed the Town House. The conflagration was a terrible blow and the public conscience was thoroughly stirred. Increase Mather preached a sermon, "Burnings Bewailed," famous in its day, in which he blames the town for its own misfortune, calling it a judgment of God against the desecration of the Sabbath.

Two weeks after the destruction of the Town House the citizens began planning a new one. Work was started almost immediately and in 1713 the building was ready for occupancy. Sewall writes in his diary of telling the Council that there was too little prayer in their midst, and threatening to absent himself unless more heed were given to divine petition. A few days later he writes, "Dr. Mather prays Excellently in the Council."



This building, with minor modifications, is the one we see today. At least, the outer walls remain the same, for fire again devastated the interior. Captain Francis Goelet who visited Boston in 1750 thus describes it:

"They have also a Town House, built of Brick, situated in King's Street. It's a very Grand Building, Arch'd all Round, and Two Stories High, Sash'd above; its Lower Part is always Open, design'd as a Change, tho' the Merchants in Fair Weather make their Change in the open Street at the Eastermost End. In the upper Story are the Council and Assembly Chambers &c. It has a neat Capulo, sash'd all round, and which on rejoycing days is Elluminated."

The new building, like the old, immediately became the center of the town's activities. Only two months after its completion the funeral of Fitz-John Winthrop was held there, and Sewall writes of the crowded streets and the rings and scarfs of the mourners. In its Council Chamber the expedition was planned against Louisburg, and here the hero, Sir William Pepperell, was fêted on his return.

To celebrate a victory of the French Revolution, a picturesque procession passed its doors and halted just beyond. An ox, roasted whole and with gilded horns, was carried on a cart twenty feet high, followed by another cart with two hogsheads of wine, and a third with bread. Tables were set in the street and the feast began. By evening the crowd became hilarious, and the onlookers from neighboring balconies were liable to be favored with a greasy joint or a crust of bread. No doubt the shades of former royal governors, if they so early made their rendezvous here, retired in disgust.

The balcony was in fairly frequent use in those days. From it was read the passing of George II, and, with loud huzzaing, the accession of George III. In the same spot, not many years later, the Declaration of Independence was read before a hushed and thoughtful crowd.

Long before that event the Old State House must have felt the Revolution coming and the royal wraiths of the balcony have moved uneasily in the moonlight. Thirty years prior to the Battle of Lexington, when Captain Knowles impressed Boston seamen to fill the places of deserting Britishers, a crowd gathered in the street in front of the State House, where the council was deliberating, and, as the long delay seemed to argue no redress, brickbats were thrown against the council chamber windows. Thus urged, Governor Shirley appeared on the balcony and promised that the men should be released.

The Boston Massacre took place almost in front of the State House doors, and, although the temper of the people was sorely tried, Captain Preston, who was in charge, was given a fair trial before the court.

In Old South Meeting House, a town meeting convened to voice its indignation, and from it Samuel Adams went to treat with Governor Hutchinson in the council chamber and to demand the withdrawal of the troops. The Governor hesitated, quailed before the determined manner of the American, and finally agreed that a part should go. "Both regiments or none," was the patriot's response, and "Sam Adams' regiments," as Lord North afterward called them, no longer had the freedom of Boston streets.

General Gage was the last royal official to preside in the Old State House. When the British left Boston and Hutchinson sought refuge in England, the building became the headquarters of the new state government. In 1789, a reception was given to Washington, who, from the balcony, greeted the throng that could not enter. The French fleet on its way home was likewise honored, and some years later, when Lafayette made his triumphal visit, a banner was hung across the street with this legend,

"We bow not the neck and we bend not the knee,
But our hearts, Lafayette, we surrender to thee."

There came a sad day in the existence of the Old State House. By 1798 Massachusetts had built herself a larger and more suitable building and, one wintry day in January, the state officials marched in picturesque procession up Beacon Hill to their new quarters. The courts had already been removed to the Court House, the Ancient and Honorable Artillery had gone, and the glory of the historic building became only a memory.

Then followed almost a century of makeshifts. The City Fathers, intent only on collecting rents, divided the interior into shops. For many years the Masons leased the upper story, for a while it housed the post office, but in general its condition went from bad to worse. Chicago offered to buy it. And yet it had its high lights now and then to relieve the monotony of dreary days.

In 1835 the Boston Female Anti-Slavery Society advertised a meeting at which Garrison was to be chief speaker. Only eighteen of the ladies were permitted to enter the hall, and the crowd outside was so menacing that they urged Garrison to withdraw. This he prudently did, but only as far as the "Liberator" office a few steps away. There the mob found him and dragged him to Washington street, where a few individuals, determined to see fair play, formed a bodyguard and hustled him into the Old State House for safety.

At the time of the fugitive slave agitation public opinion had greatly changed. When a judge decreed that one such unfortunate must be returned, all business along Washington street was stopped as he was escorted with muffled drums to the wharves. Across the street, near the Old State House, a coffin was suspended, with a motto above it, "The funeral of liberty." But the edifice had fallen into such evil days by that time that I doubt if the aristocratic shades of the past would consent to grace the balcony, even to enjoy the display.

But better days were in store for the Old State House. Every once in a while a voice had been raised in its behalf throughout its lean years. Harrison Grey Otis pleaded with the flowery eloquence of his generation for its protection, and for a decade his words prevailed. In 1881, largely through the influence of the antiquarian, William Whitmore, the city council voted to restore the building as far as possible to its former condition, and it was then leased to the Antiquarian Club, newly incorporated as the Bostonian Society.

But even with such a tenant it has not been wholly safe, for before long the subway appropriated a small part for a station. Legislation has since been enacted to prevent further depredations, so it seems as if the Old State House might long remain as it is today, the home of a notable society, and a museum filled with relics of the early life of the town.

If there are sermons in stones it is equally true that they are to be found in bricks, and the United States can never afford to allow any more of its historic structures to disappear before the vandal. Such relics are too precious to be lightly cast aside. They are chapters which can never be replaced.

Mr. Ford's Page

WHATEVER may be the cause—a different rate of vital vibration, a different degree of energy, or what not—it is reasonably certain that men's difference in ambition and self-respect springs from the ideas they live by. There are those who desire to "do," and there are those who desire to be "done by"; the difference spreads very far.

The stronghold of this difference is in *the idea.* Train a child to expect that things will drop easily into his lap upon his slightest whine; train the mind to regard life as a benevolent system of providence that makes weakness weaker by serving it; train a boy to look for favors from others, instead of looking to his own powers to create or command what he needs, and already the seeds of dependence are sown, the mind and will are warped, life is crippled. And all by a mental attitude, by an idea.

Emphasis is laid on this particular phase of weakness because it is so common. Unintentionally a rather soft teaching concerning the providence of the world has fostered it. Doubtless there is a providence which, from an invisible plane, fulfills what is lacking in men's most sincere efforts. Human experience seems to indicate that. Men's efforts seem at times to start up corresponding currents of power which manifest themselves at critical moments, to complete a process or to give a favorable turn to seemingly unfavorable circumstance. The experience of men in all generations seems too clear on this point to leave much doubt about it.

But, this providence—to give it that name—is not the servant of the weak, but of those who have put forth their utmost strength. They may be weak at the moment, but they are not weak by reason of being naturally weak, but by reason of being strong and of having given all their strength to a cause or a task. This catching up, then, of the last threads, or supplying the last touch, this providence, as men call it, comes to the help of the strong who being unsparing of their strength have drained it for the moment. This is simply to say, in another way, what is already held in the old saying: "God helps those who help themselves."

The story is told of a Persian poet who one day found a raven's nest full of young, and the mother bird dead upon the ground. He was thinking upon the doleful chance of those young birds when suddenly an eagle swooped downward, his talons holding food, and fed the famished nestlings. "Ah," said the poet, "here is a lesson for me: Providence cares for every hungry mouth." So he began to live after that idea. He ceased to work—he was waiting for his eagle. Then, in the extremity of his want he had a dream, and in the dream he was admonished thus: "You saw the eagle and you deduced therefrom the doctrine of providence, and rightly so. But what part of that scene was meant for man's imitation? Should he play the helpless weakling in the nest, or the helpful strength?"

There it is in a nutshell; it is more man's honor to play providence, to work, to make things come to pass, to be himself a source of help to others, than weakly to wait for help to come to him. If there is a providence, what then?—wait for it? No, imitate it, duplicate it, aspire to be the helper rather than the helpless. This very idea of the strong and active side of the thought of providence will have a corrective effect upon those who have been weakened by the softer side.

The books that boys once read were all based on the happy accident of the hero meeting a lord or a rich man who took a notion to him and without rhyme or reason lifted him to riches and power and married him to the princess. It was the old idea of expecting someone to come along and do something for you. Fortunately, life is so arranged that boys do meet people—good and bad—and if the boy has good intentions he finds useful friends. But, in these days the emphasis is more wholesome and more creative of self-respect: a man's destiny is in himself, he is not dependent on others, the very obstacles he encounters are mostly nicely adjusted tests to raise his energy, courage, initiative and resourcefulness one notch higher in encountering and overcoming them.

Now, all this is American in its best sense. It should be said that the boys' books just now referred to were not American in their inspiration: they were mostly European—the kind lord and the Lady Bountiful sort of stuff, all enforcing the idea that if you keep your hand out like a beggar, someone will be sure to drop something into it. That was not to be found in American boys' books of the last generation. The dime novels, against which so much has been said, were at least wholesome in that they held up energy, independence, action, courage, resourcefulness as virtues that counted heavily in life. The boy heroes of those tales depended on themselves to conquer adverse circumstances. They had no one else to depend upon. And the "happy ending" of the stories was that courage and energy and intelligence could put a dent in any combination of circumstances that might be allied against one.

The alien, the other-than-American, idea, namely, that man's main business is to wait until someone else does something for him, has gained ground in our country. Individual weaknesses, like individual strengths, when widely enough diffused, soon make themselves apparent in national programs. And sometimes the programs of weakness resemble so much the programs of strength that they are mistaken for them. There is no question that American strength and initiative have resulted in programs of national mass action. The urge to do big useful things, which is a mark of the American mind, has formed bigger projects than individuals can accomplish singly, so there has been a suggestion of pooling national strength for national achievement.

Now, weakness has counterfeited that method. Mass weakness has assumed the appearance of mass strength from the mere fact that it is massed. Its program, simmered down to principles, is this: "We can force the country *to do things for us.*" The whole list of programs which assume that the "government" is an inexhaustible source of privilege and favor, the whole list of proposals that the country do this for this class and that for that class, is the expression of the hand-out type of mind. Mass weakness looks like strength, but it is not. It does not propose itself to do the thing it suggests, it proposes that the "doers" do for it. This type of mind never proposes to serve the country, but to make the country serve it.

It is true that the strong ought to serve the weak, but not to confirm them in their weakness. Service to the weak is disservice unless it has the effect of bringing the weak to strength and independence. Fostering the hand-out attitude of mind is extreme unkindness. That is why our customary charity is such a contemptible thing. It weakens those who are willing to give because it weakens those who are willing to receive. Real helpfulness costs; it costs thought and effort by those who give it, and it costs thought and effort by those who receive it. And neither part likes to make the effort. Charity is an evasion of effort. Charity is the easiest way for both, and consequently it establishes the very conditions it ought to abolish.

Thus in individual cases and in national movements we see men's entire attitude toward life warped by false ideas. The beginning of correction is with the individual. Life is a freer thing, opportunity is a wider field, than ever before.

THE hand-out type of mind is the result of a false idea of life. Weakness waits for Providence, but Providence is reserved for those who are weak because they have spent great strength in a task. Providence does not confirm man's weakness; it completes his strength. Doing things for people is harmful misdoing unless it increases their independence, energy and initiative. The American idea is that people should do things for themselves, and American life gives opportunity for this. Our forefathers with a single opportunity and courageous initiative accomplished more than this generation with a thousand opportunities but with the pernicious doctrine that the "government" or "society" should do it. Charity is contemptibly easy both to give and receive, but helpfulness costs even to receive. Guard strictly against the weakness of the hand-out type of mind.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The President Is at Work

HIS critics say that it is for party reasons that he does it silently, but that President Coolidge is steadily cleaning out the weak spots in government is a fact which they cannot deny. He could do it with great noise and advertisement if he wished and perhaps bring about his head a halo of saffron glory from the yellow press, but as he has never worked that way there would seem to be no fair reason to accuse his silence of being a method to prevent the public from knowing just how bad the Republican officeholding crowd was found by him to be. That the President is working silently is a fact, but that he is working is a greater fact. Almost every day, two or three lines in the papers notify the public that an officeholder here and there has been dropped. That is all. But behind some of these announcements there is a story, and there are now sufficient of them to indicate that the President is diligently pursuing a clean-up program which will eliminate the unfit and fill their places with servants of a more dependable type. It may be respect for the late President Harding that predisposes to silence; it may be a desire to cleanse the government without additional aspersions upon the party; but more likely it is the businesslike attitude of other important concerns which act upon the principle that the thing to do is the thing to be done, and get it over with. We have been educated of late in the notion that the chief business of a government is to raise a row. The true mission of government is to do the nation's business honestly and efficiently. This seems to be President Coolidge's view of the matter.

Florida Kills Taxes

THE people of Florida, voting six to one, have amended their State constitution to provide that the legislature may not levy a State income or inheritance tax. By making this amendment a part of the fundamental law, Florida takes a stand against the tendency toward confiscation which has appeared in this country. Florida knows that a State can grow only upon development, and that excessive taxation discourages development and eventually taxes the tax sources out of the State or out of existence.

Already Florida is the winter home of thousands of well-to-do people from all parts of the country; but the State wants them to make their permanent home there. Her treasury does not need their income or inheritance taxes, but the State itself needs capital for the building of roads, homes, schools, hotels, and apartment houses. In the belief that increased developments and building operations will draw workers from other States, and thus add to the population, and that the resulting increase of activity will produce a larger tax revenue than income and inheritance taxes combined, Florida voluntarily relinquishes revenue which she might easily obtain by levying these taxes.

Most of our States collect income and inheritance taxes, although the people of Oregon recently repealed their income tax law, and the voters of Michigan rejected a similar proposal. Most States are continually devising ways and means to take all they can get from their citizens in the form of taxes. The era of extravagance which followed the war caused many States to raise to confiscatory proportions these two kinds of taxes. Florida's progressive example is expected to produce a wholesome reaction in States that have gone to the opposite extreme, and to bring to the attention of the voters in these States the necessity for economy in State government.

The only flaw in the Florida amendment, it would seem, is that at some future time Florida may wish to levy an income tax to tide her over an emergency. In that case, the amendment just passed would be an insuperable obstacle.

Pistols by Mail No More—Perhaps

THE Lower House of Congress has passed a bill restricting the use of the United States mails for the transportation of firearms that can be concealed upon the person. Thus comes nearly to an end the long disparity between local and Federal laws. Local police have been doing their utmost to curb the traffic in pistols, but any crook could order his pistols sent by mail and have them delivered into his hands by Uncle Sam. If the law covered the transportation of publications advertising small arms, the situation would be more fully met, as far as law can meet it. The strongest argument against the wholly admirable campaign to reduce the supply of pistols is that law-abiding people will certainly obey the law, but will the crooks? Will it come to pass that the only classes that need protection will be unprotected, while the criminal class goes fully armed? The question only emphasizes the fact that laws are not the cure for anything; at best they are but indications of the direction in which decent minds move.

The Devastating Rat

FEW people realize that the greatest enemy within the borders of the United States today is the brown rat. There are as many rats in this country as there are people and the total yearly damage they cause amounts to $200,000,000. It would take the labor of 200,000 men to produce the material eaten and destroyed by these rats. It would require about 5,000,000 acres to produce the grain they destroy.

Bad as these things are, there is still worse. Through the parasitic insects that infests them, rats are almost wholly responsible for the perpetuation and transmission of bubonic plague. An authority states: "Septic pneumonia and epidemic jaundice in man have been traced to the rodent, and it is known to perpetuate trichinae in the pig. It is suspected of being the carrier of infantile paralysis, and it undoubtedly carries many kinds of infectious germs from its haunts of filth, leaving them upon human food."

The lion is called "the king of beasts," but a single rat does more harm in a year than a lion. The rapacious rodent also leaves tigers, wolves and other wild animals far behind in its destruction of life and property. The Chief of the Bureau of Biological Survey says: "House rats are of more universal concern to the people of the United States, from the Atlantic to the Pacific, than any other wild animal pest. They have long been recognized by experienced observers as the most destructive species of animal in the world, and as one of the most dangerous from the standpoint of the transmission of communicable diseases."

One cause of the increase of the rat is undoubtedly the indiscriminate killing off of their natural enemies, such as owls, hawks, and herons. Skunks, weasels, and snakes are also among the enemies of the rat that have been nearly exterminated through prejudice and ignorance. All the hawks, owls, and weasels in the country combined do not destroy one-sixth as much poultry or game as the common brown rat, and many of them are efficient enemies of both rats and mice.

Systematic poisoning and trapping are remedial measures suggested by the Bureau of Biological Survey, but on the principle that "prevention is better than cure," it is pointed out that to combat the rat successfully is largely a building problem. Buildings should be so constructed as to exclude the animals from shelter and food. It is claimed that if half the money now spent in feeding and fighting rats could be expended in wisely planned and well-executed cooperative efforts for rat repression, it would be possible within a few years nearly to rid the country of its worst animal pest, to reduce losses by its depredations at least 90 per cent, and to free the land completely from the fear of bubonic plague.

A Rat Week, one of the greatest "safety first" campaigns, has been tried in Britain and elsewhere with success.

A Disgraceful Squabble

IT APPEARS that the recent flare-up between—not Great Britain and the United States, but between a British and an American statesman—concerning French payments on the war debt, really grew out of nothing. It was a nasty interlude nonetheless. And it is left hanging in the air because, apparently, neither nation thinks it necessary to explain to its people what it is all about.

There was, it seems, some talk between Americans and the French about the repayment of the French debt to America. Whereupon Britain made it known that she would expect France to pay her British debt in the same proportion as the payments to America. The manner in which this was done could not have been better calculated to wound both French and American susceptibilities. It looked for the moment as if Winston Churchill was wistful of some of the praise then being bestowed on the Foreign Office for "firmness" in Egypt. Winston was going to be "firm" with France and the United States. There's enough Anglo-Saxon blood in the United States to resent that, and in a test of "firmness" Winston may be found to lack starch.

Anyway, it appears that France, for the first time in many a long day, has an opportunity to call both Britain and the United States to account. There has been no proposal to pay the United States. The whole tempest was in a teacup. The *Temps* makes a statement that appeals to proper instincts everywhere, when it says:

"The Anglo-American controversy on the subject has a tone very disagreeable to us . . . . What is especially striking is that neither the one side nor the other pays the slightest attention to the circumstances in which these debts were contracted, nor to the moral engagements taken at that time. Never has it been better shown that if for many people the war has been forgotten, debts have not.

"For our part we do not forget the aid our Allies gave us in the most tragic hours of our history nor the bravery with which they fought at our side. However, if our cause became their cause, it was because a German victory would have constituted a terrible menace to their independent existence, their political position and their material prosperity. It must not be forgotten that for four years France served as the battle ground of the nations and that the honor of being the last defense of civilization and liberty cost her the ruin of her richest departments.

"That is the consideration we are obliged to recall since our creditors across the Channel and across the Atlantic seem to wish to forget it when they demand to be paid by us before the debts of those we fought together have been acquitted . . . . Is it logical, is it admissible, that they try to place the settlement of interallied debts ahead of the payment of reparations?"

There is no evading the fact that the whole position is that of trying to force France to pay for the war, instead of Germany. Germany is recuperating at a rapid rate. Just what is the reason for officials of the United States precipitating the controversy in this form at this time? We can understand Britain's anxiety, because British citizens are paying nearly half their earnings in taxes, and in France too the tax burden is breaking the backs of the people. But why does the United States become insistent now? Why is all the pressure exerted upon France and all the assistance extended to Germany?

Plain people will feel, next to the disgracefulness of the squabble, that there is something here about which statesmen are not quite frank.

Paper Profits Provoke Pleasure

FINANCE AND INDUSTRY, of Cleveland, cackles like a happy hen over the profits derived by Fourth Reserve District industries through the boom caused by the election. It estimates the rise in industrial stock values in the open market at $250,000,000 since election day.

It may be cruel to prick the bubble, but it is best. The rise of stock in the market has no effect on the industry issuing it. High or low, the dividends declared will be exactly the same, based on the face of the certificate, and the gain or loss is that of the owner, not the company. In the operations of a corporation, however, the gyrations of the market make no difference. It would be well if financial journals would give the people the benefit of that fact. It would be journalistically more honest, as well as socially more serviceable, to educate the public in the difference between gambling or speculation and business, than it is to hold up the stock market and its tricks as an adjunct of business. It is not. The stock market is the clinical thermometer marking the rise and fall of the speculative fever; it is not the barometer of sound business prosperity.

Cranberry Bogs of Cape Cod—Their Workers

Festival Berry Grown by Men From Cape Verde, Who Came to the New World as Members of Whaling Crews

American-born Cape Verders.

Whalers' Monument at New Bedford, inscribed: "A Dead Whale or a Stove Boat."

THE coast of New England has always been a whaling coast. In 1605 there was written a description of the Indian method of harpooning whales from their canoes. The Pilgrims in the *Mayflower* found the abundance of whales around their ship one of the chief reasons for settling inside Cape Cod. Whale fishing slowly developed along the New England coast, centering and reaching its early highest development in the Island of Nantucket. In 1712 a Nantucket whaler was blown out to sea but returned with a sperm whale—the first sperm whale known to have been taken by American whalers. Sperm oil being more valuable than other whale oil, the Nantucket whalers changed their methods and rapidly became deep-sea whalers. This necessitated increasing the size of their vessels. By 1730 "try-works" were built on shipboard, so the vessels could stay long at sea and there complete the task of getting the oil from the whales captured. This fact encouraged building larger vessels, until by 1820 it was a profitable venture to make them of 300 tons' capacity.

New Bedford, which in time was to take the place of Nantucket as the queen city of whalers, was early at this profitable and romantic venture. It is well authenticated that as early as 1765, perhaps 1755, Joseph Russell, the founder of New Bedford, was whaling. Increase in size of vessels was the chief cause of the shifting of the whaling center from Nantucket to New Bedford. A bar across Nantucket harbor prevented arrival of heavily laden ships, but a great dry-dock barge, called the *Camel,* was built which floated vessels across the bar, but larger and larger vessels at last "broke the camel's back." In 1843 Nantucket had eighty-eight whaling vessels—her largest number. Three years later, when Nantucket possessed only sixteen vessels, her neighbor, New Bedford, had sixty-nine. Nantucket's last whaler went out in 1869. As early as the year 1857 New Bedford had 329 whaling vessels which beat their adventurous courses over all the seas, and brought back as whale fishermen many strange ocean peoples—as well as familiar Europeans, whose shores were ocean washed. In 1858 Daniel Ricketson presented a brief picture of New Bedford's "Midway" in his book, "The History of New Bedford," where he says:

"A part of New Bedford at the South End of Water Street is now known as Fayal, from the large number of Portuguese from that and other ports in the Portuguese dominions. In fact, our city is a microcosm. Not only the Portuguese and Spaniard, but Dutch, Swedish, Norwegian, German, French, English, Scotch, Irish, and other natives of Europe, as well as of Asia and Africa, the Sandwich Islanders, New Zealanders, and so on, are to be found among our seamen, and more or less of them in port the greater part of the time."

The New Bedford Museum of the Dartmouth Historical Society, where a most complete visual story of American whaling is told, has valuable ethnological collections brought back by whalers from the many "strange islands of the sea." Rare feather-work robes from old Hawaiian royalty, regal carved maces from Melanesia, tattooed human heads from New Zealand, armor and lacquer from Japan, porcelains and silk mandarin coats from China—in fact, rare specimens of distinctive culture which can no longer be duplicated, from almost every port in the East and the oceans were brought home by whaling vessels. Representatives of most of the strange Island peoples who produced these wonders and who came to New Bedford with the early whalers have now disappeared from her streets. However, "Fayal" is still there as the Portuguese part of the city whose inhabitants are mostly Portuguese from the Western Islands; while the area from South Water Street to the water front is still the seat of the Cape Verde Islanders.

Cape Verder's "Farm." The level land is his cranberry bog.

Mr. Forbes in his now rare pamphlet, "Whale Fishing of New England," tells us that "Whalers would rarely cruise past the Azores without stopping at Fayal where they were most hospitably received by the American Consul." Since the Cape Verde Islands as well as the Azores were Portuguese possessions, and were not far distant, and since Cape Verders—especially those of Brava—were famous seamen, American whalers acquired the habit of going to Brava for a part of their crews. Brava was really a godsend to the New Bedford whale captains, because it became more and more difficult to recruit whaling crews in New Bedford. The voyages were often four and five years long, and a look at the seamen's quarters below deck—sometimes called "The Black Hole of Calcutta"—battened down tight in bad weather, where one's berth was so narrow that a man "had to get out in order to turn over," was enough to discourage all except hardened seamen. In fact, it is said that captains, in an attempt to prevent desertion, were accustomed to anchor their ships well outside the harbor before taking on the final crew. Seaman Ben's tale in Thomas Bailey Aldrich's "The Story of a Bad Boy" will recall that idle seamen on shore were sometimes "drugged in liquor" and found themselves next morning out at sea signed for a long-time whaling voyage.

The Cape Verder is a natural seaman. The barren lands of the Archipelago, the safe seas surrounding it, frequent inter-island communication, and the abundance of food fish in the sea, all led the Cape Verders to familiarity with ocean life. When the American whaling vessels came to the islands with a sort of crew-hunger, the circle of events was complete—Cape Verders as experienced seamen and whalers needing willing man-power; "they are more interested in a good catch than any other crew and they are especially sharp in locating a whale," said an old New Bedford captain. The inevitable result was a new type of immigrant coming to the United States, since when the vessels returned to New Bedford they often brought their Cape Verde crew with them. Later on, Cape Verders shipped on whalers as their best or only means of migrating to America.

The exact date of the arrival of the first Cape Verder to the United States is not known. The famine of 1832, so an elderly native told me, brought to the Islands a shipload of food and provisions from Philadelphia, whose merchants were traders with the islands. This event, he believes, first turned the minds of the Islanders toward America. Names and dates in my possession, given by credible elderly witnesses, place the time of definite early and permanent immigration as far back as in the fifties of the last century. One known family was here some years before our Civil War and returned to Brava when war broke out. They returned to New Bedford "just before the assassination of Lincoln," and with them came about a dozen other Brava families. Among that number was a young married woman who is now 76 years old and who is most gracious and intelligent. I had an interview with her at her home and found her knowledge of early Brava days, both in the island and in New Bedford, very interesting. Cape Verders continued to come with whaling vessels until recent years. Though whaling in New England declined, due largely to the introduction of kerosene following the discovery and ever larger use of petroleum products, yet whaling vessels have continued to go out from New Bedford. In 1875 she sent out 116 vessels; in 1886 there were 77; she still sent 24 in 1906 and 20 in 1913. Since the decline of whaling the Cape Verders have gone eagerly to the merchant vessels. They are stewards, cooks, firemen, crew men on a large part of the New England coastwise vessels, tugs, lighthouse tenders, and tramp merchant ships. Since the Russo-Japanese War they have largely taken the places of the Japanese on New England vessels, and many captains say they prefer them.

Photo by Jenks.
Sandwich road community of Cape Verders.

They also do a good deal of business on the ocean these last years on their own account. Three or four men pool their funds, buy up old Essex-built "Glouster Fishermen" ranging from 125 tons to 300 tons, load them from "chock-to-block with everything from frying pans to pillows," and venture on trading and passenger trips to and from the Cape Verdes. Last autumn thirteen such vessels went to the Islands from New Bedford. Especially during the past twenty-five years of near-drought the claim of New Bedford Cape Verders that their friends back in the Islands now live in very large part off American-produced resources is reasonably true. Last autumn the little barks and packets carried corn, beans, beef and lard, all of which the Islands formerly produced in abundance, as well as petroleum, stoves, dishes, bedding, chairs and every sort of common household furniture. Most of these vessels carry twenty to fifty passengers, besides their crew, both ways on their trips. Cape Verders think little of that ocean voyage of thirty-odd days, as they are natural travelers by water, and those in America make frequent trips to their homeland.

Because of the many different classifications of Cape Verders and because so many sailors, enlisted as immigrants, have entered America from small vessels, there are no reliable official figures as to the exact number of Cape Verders in America. The estimate is about 25,000 now in the southeastern corner of New England. A few go annually to California, so there may be 500 others outside this eastern area. Their habitat in the East may roughly be said to be the coastal area from Hartford to Boston.

As the number of Cape Verders in America increased it was inevitable that employment should be sought in diverse fields. Most of the men were already familiar with the life of the seaman, the small farmer, and the fisherman. All of these activities have claimed a considerable number in America, and as seamen and small farmers they are gaining ground.

An entirely new type of employment was in the industrial plant where the necessarily socialized contacts have frequently not been to their advantage.

New Bedford is at present noted for turning out the highest grade of cotton textiles made in New England.

(*Concluded on page 14*)

A City's Successful Financial Experiment

Non-Interest-Bearing Scrip Versus Interest-Bearing Bonds

By WILLIAM BRADFORD DU BOIS

IN 1878 the city of St. Joseph, Missouri, was in a very bad way financially. The bonded debt with accumulated interest amounted to $2,000,000. In these days of billions this may seem like a trifling sum, but it was very large considering that at that time the total assessed valuation of the taxable property in the city was only $7,000,000, and the interest charges necessarily made the taxes very heavy. In addition to this, there was a heavy floating debt represented by interest-bearing warrants on the city treasury. This was steadily on the increase, because the expenditures of the city exceeded the receipts.

How did the city get into such a financial morass? It is the old story of debt and interest, more debt and more interest. St. Joseph, especially its merchant and banking classes, had for a score of years prospered greatly, owing in part to the large amount of money which found its way into circulation during the early days of the gold excitement, and also to its banking facilities which were unequaled by any city west of Chicago or St. Louis. Money, however, as was the case with western towns generally, commanded high interest rates, and this, in the end, worked to the disadvantage of the people as a whole. There was little or no foreign capital in the city, and the property of the city, whether in real estate, merchandise or money, was held mostly by its own citizens. Ten per cent was the usual discount rate charged by the banks to first-class customers. The bankers were prosperous at all events.

How St. Joseph Found Relief

THE provisions of the first city charter were good—too good to suit the people, because the council was restrained from creating an indebtedness exceeding $1,000. So, in 1853 and 1855, descents were made upon the legislature and amendments secured authorizing the city to "subscribe for the capital stock of railroads and for erecting wharves and protecting the banks of the Missouri" against the encroachments of that changeful stream This was well enough for a year or two, and thousands of dollars were voted by the people for these purposes. But as the western country was settled and developed, new schemes for investing city funds were devised, and a call upon the legislature in 1857 secured the passage of another bill authorizing the mayor and councilmen "to subscribe to the capital stock of any railroad terminating at or near said city, or for the stock of any other improvement tending to promote the general welfare and prosperity of the city."

Bonds were voted with a free hand, and the interest was almost invariably fixed at from 8 to 10 per cent. Some of these bonds went for railroads that were never built. Others for a road that was built and afterward abandoned, others for the bridge, for river improvements, for building macadamized roads and for other schemes supposed to benefit the city. The people apparently voted "yes" on almost every proposition submitted to them, for the records of the defeat of measures of this kind are few and far between. They evidently reasoned that the only great city in the West must give a certificate to that effect in the shape of an indebtedness of a million or two. They also probably argue (Oh, that old fallacious and insidious argument!) that future generations would pay these debts so contracted. "Why should we do anything for posterity?" exclaimed Sir Boyle Roche in the course of a debate in the Irish Parliament. "What has posterity ever done for us?" To be sure. What *can* posterity do for us?

Of course, halts were called now and then by thinking men, but usually they were of short duration, and the issuing of bonds went merrily on until the state constitution of 1870 put a limit to city indebtedness, prohibiting its exceeding 5 per cent of the city's assessed valuation. Further amendments to the charter, later on, prohibited the expenditure of money beyond the receipts of the city. It was thought for a time that this provision would at least prevent the incurring of further indebtedness, but this was a false hope; and soon a scheme was devised that circumvented the law. The council simply estimated the receipts at the beginning of the year and went on appropriating from this estimate, totally regardless of whether it was collected or not. As a consequence, city warrants were soon below par although bearing interest at 6 per cent. The city hall, begun in 1873 and occupied in July, 1874, was built by issuing these warrants, or certificates, the sum of $50,000 being subscribed by interested property owners. If they had not borne interest this would have been following quite closely the Guernsey Market plan of financing, an account of which has appeared in the pages of THE DEARBORN INDEPENDENT, because the certificates were made receivable for city taxes at the rate of one-fifth the tax a year. In other words, if a certificate holder owed $100 taxes, he could pay $20 of it with certificates.

But something had to be done to save the city from default, if not actual bankruptcy, and it was in 1878, under Mayor Joseph A. Piner, that relief was brought by issuing warrants on the city treasury in the denomination and shape of one and two dollar bills, non-interest bearing, and receivable for licenses and for a portion of the city taxes. The interest in the city tax budget had to be paid in "money of the realm" as the bonds of the city were principally held by non-residents, who, of course, demanded payment in something that they could use, as the "ones" and "twos" had little or no circulation outside the city limits.

These warrants which eventually came to be known as "city scrip" were issued to the extent of $100,000, all in "ones" and "twos," and strikingly similar in appearance to national bank notes, after which they were evidently modeled.

People Took the Warrants

FOR several years they were received by the city in payment of certain taxes and licenses and again paid out for salaries, and so forth, and were thus kept in constant circulation.

Being printed on a comparatively poor quality of paper, they speedily became badly mutilated and filthy to a deplorable degree.

The first outcry by the public against them was for this reason and this reason only. The outcry ceased immediately upon the redemption of the old warrants with crisp new ones which the city provided.

Right here it may not be out of place to state that the reason for their renewal, as above stated, was also the reason for their eventual retirement. The banks, of course, were opposed to their issue from the start, but, as long as the warrants were in good condition, there was no complaint against them except by business men who were occasionally put to the inconvenience of hunting up exchange for them to do business through the banks, as the latter could not accept them on deposit as money.

Notwithstanding that there was some question as to the legality of the city's action in the premises, the people took the warrants at their face value without question, and they were kept in active circulation—too active to keep them clean and fresh looking. The laboring man was paid for his labor with them almost exclusively. The laborer paid the butcher, baker and grocer; they paid the local jobber; the jobber paid it to his laborers, clerks, and so forth, and thus they were kept constantly going the rounds.

Carried the City Through

BUT the constant circulation soon reduced the scrip to a dilapidated condition, necessitating the renewal of a large portion of it under Mayor Posegate in 1882. An attempt to replace it again in 1885 was frustrated by General James Craig, the controller, who refused to certify to the ordinance carrying an appropriation of $800 for that purpose, on the ground that the whole transaction was illegal.

The legal inability of the city to appropriate money for a renewal of the warrants hastened the end, and the year 1885 saw $25,000 worth redeemed and destroyed by burning; the following year a similar amount, and in a few years thereafter, practically the last warrant was redeemed.

The experiment made by the city of St. Joseph was a successful one. The scrip did what it was designed to do—it carried the city through. In fact, paradoxically as it may seem, it was the very success of the experiment which led to its final abandonment. It had pulled the city out of a bad financial hole and saved to the taxpayers between $6,000 and $75,000 in interest, which under the old bond-issuing plan, they would have been obliged to pay. The experiment would have been even more successful if the city officials had established a municipal clearing house as a place of deposit for the scrip, giving the depositors the privilege of checking it out again as wanted. In the case of the famous Guernsey experiment, it was the market house itself that performed the functions of a clearing house and contributed greatly toward the success of the experiment.

AUTHOR'S NOTE—For much of the information contained in this article, I am indebted to Purd B. Wright, former city clerk of St. Joseph, and now librarian of the Free Public Library at Kansas City, Missouri. I also wish to acknowledge my indebtedness to "The Daily News History of Buchanan County and St. Joseph, Missouri."

Congress to Tackle the War Debts Problem

By BURT M. M'CONNELL

THERE is every indication that the question of foreign war debts will come up early in the short session of Congress. For one thing, the life of our Debt Funding Commission, of which Secretary Mellon is chairman, will automatically expire February 1, unless Congress, which created the body, prolongs its existence. And while Congress undoubtedly will extend the life of the commission, which is the only body authorized to negotiate with our foreign debtors, our national legislators will hardly be expected to accomplish this without considerable discussion. Secretary Mellon may even be asked rather bluntly just why France and Italy, our largest debtors, have made no move whatever toward meeting the United States halfway in the matter of debts.

There are other straws in the wind. The new British Government holds strong views about the necessity of beginning to collect its own debts, which amount to more than $9,000,000,000. When the allied finance ministers meet, therefore, it is expected that they will point out to France and Italy that it is six years since the Armistice was signed and that something on account would be appreciated. It is also expected that France will request a reduction of its war debts to Great Britain and the United States, but our representatives at the conference will not be permitted to discuss such a reduction.

One of the most hopeful signs, as far as this country is concerned, is that France's leading bankers are advising their government to come to a definite understanding as soon as possible with England and the United States regarding the nation's war debts. The attitude of the French Government, however, is that since Great Britain funded her debt to this country at approximately 33 cents on the dollar, a similar reduction should be accorded France when it comes to funding her debt. France also maintains that Germany's reparation obligations have been cut down some 66 per cent, and that French debts should, therefore, be reduced in the same proportions as French war claims. The assumption of Premier Herriot that the Dawes Plan cut Germany's reparations total by 66 per cent is difficult to understand, however, since there was no attempt by the Dawes commission to fix a reparations total. As far as the world knows, Germany's reparation debt is still $33,000,000,000.

The grounds on which Premier Herriot plans to settle France's war debt to this country at 33 cents on the dollar are these:

The low rate of interest and amortization agreed upon in the funding of the British war debt makes the total debt in the long run, if figured in the ordinary way, with compound interest since the beginning, approximately 33 per cent of the original total. France figures, therefore, that England has settled at 33 cents on the dollar. Furthermore, maintain the French, if the Dawes Plan is carried out, Germany also will settle on the same terms. Thus the French Government considers itself justified in asking for a similar reduction.

For years Great Britain, France, Italy, and other foreign debtors hoped their debts to this country would be canceled, at least in part. Great Britain, in particular, played politics with her debt until she finally realized the force of public opinion against cancellation. The British Government thereupon made a funding arrangement with our Debt Commission, and her example has been followed by Hungary, Lithuania, Finland, and Poland. France, on the other hand, has always endeavored to join the problem of her war debts with German reparations. Her contention is that if she collects less than she hopes to obtain from her late enemy, then her creditors should consent to a scaling down of the amounts due them. And Italy, Belgium, and our smaller debtors are doubtless waiting to see what terms France will make with this country, to obtain similar favors.

So far, foreign governments have paid back $300,000,000 of principal and $850,000,000 in the form of interest. At present, payments of one sort and another are being made on approximately $5,000,000,000. This leaves a total of some $6,000,000,000 yet to be paid. With unpaid interest, the amount would be still larger. Of these war debts, the French is almost $4,000,000,000 and the Italian almost $2,000,000,000.

Now that the problem of German reparations is in a fair way to settlement, the general recovery of Europe may be said to have begun. Congress and the Debt Funding Commission undoubtedly will welcome any move toward payment of their war debts which our European debtors may make. For the entire country is being taxed to pay the interest and principal on the Liberty Loans that went to help the Allies.

Fur Trappers Are Skinned While Skinning

How Prices Received for Pelts Multiply Under Middlemen's Manipulation

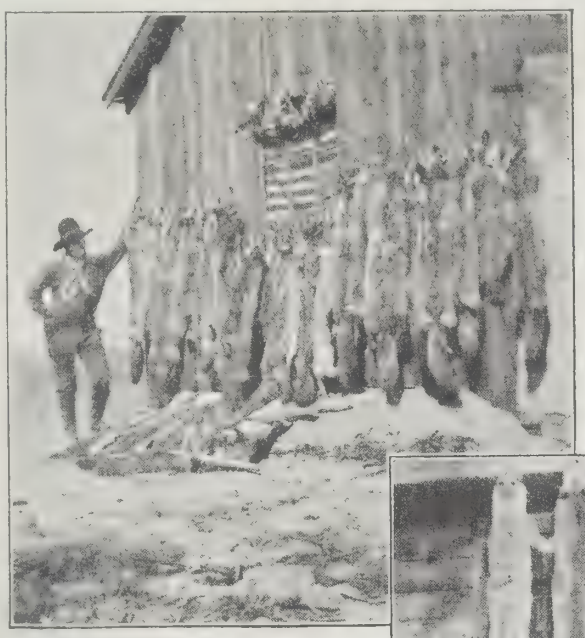
By L. C. BRANSON

THE old trapper said he liked trapping because he wished to dwell in the wilds away from the cold-blooded cruelties of humanity—that he preferred the association of coyotes to that of his unscrupulous fellow men.

But even in the supposed freedom of the wilds he never got away from the shackles which men welded onto his hands and feet. For, if there is any one business in the United States that is totally and absolutely under Jewish control it is the purchase and resale of raw furs.

By the same token, the raw fur resources of North America are being depleted at airplane velocity.

If there are in the United States 1,000 raw fur buyers, divided between the cities of St. Louis, New York, Chicago, Minneapolis, Omaha, Denver, San Francisco and Kansas City in about the order named, with hosts of others in such smaller places as Oshkosh, Fort Wayne, Salt Lake City, Columbus, Ohio; Lincoln, Nebraska and Las Vegas, New Mexico, it will be found that about 900 of them are Jews. Many, to be sure, use American names, some carry the names of Americans who founded the business, but as surely as the numerous trappers are skinning the animals, fur buyers are skinning the trappers, and using every wile to replenish and multiply the supply of victims.



One month's catch of a Nevada trapper, who made small wages thereby, but not more than half of the value of the raw furs.

To accomplish this, Uncle Samuel, otherwise the United States, is made the unwitting accomplice. The Post Office Department is the vehicle.

In general here is the way it is worked: Early each autumn trappers and others residing in fur-bearing regions are circularized with gaudily printed and extravagantly worded literature, predicting high fur prices for the winter. Advice for all hands to get busy and make money rapidly in a most fascinating occupation is freely given. Usually there is inclosed a souvenir pamphlet in many colors, telling of "Fifty Years in Business" with constant satisfaction to "our shippers," when in many cases the houses have changed hands numerous times and been run by Jews for at least the past ten years.

One's letterheads carry the words, "The Guarantee That Guarantees Protection Against Dissatisfaction." On the reverse side is a form letter in imitation typewriter type, setting forth in substance that the writer is sorry to learn of dissatisfaction with price remitted for shipment, and while the price was the "very highest" possible to offer, rather than lose the shipper's friendship, in this particular instance a re-examination of the furs had been made by "both Mr. S——— and the writer" (Mr. S——— being the name of the man who sold out ten years ago) and kindly to let them know the least "you will accept"—meanwhile hanging onto the furs and preventing their owner from selling them elsewhere. Following the reply comes another letter, not a form letter this time, saying the price asked was too high, but for the sake of retaining the shipper's friendship and because "your furs are here," the house would make an exception this one time and split the difference—meanwhile still holding the furs and preventing their sale. This process is carried on until the so-called "market" is announced to have gone to pieces with the season about gone and the furs must be sacrificed for what they will bring.

Another trick is to mail postal cards each month to fur shippers, offering so much apiece "flat" for certain kinds of furs. *Because the coyote is used for all manner of made-up fur imitations from seal to black fox, and is sometimes sold as "wolf" and "gray fox,"* it is the best known raw fur and in big demand. A buyer sends out cards in December offering "$10 apiece flat for coyotes," the amount in huge black-face type. In January he raises the ante to "$11 flat," February, $12 and March, $13. A mass of fine print on the card relates that the house has a very big order to fill and must have these coyotes, but that the offer is only to one person or selected persons in a given area. But at the bottom is a little notation that *the card must be returned* with the shipment, *"Because it is a special offer to you"* to avoid confusion, and so on. As a matter of fact, the notation *gets the card out of the shipper's hands* and prevents him from turning it over to the postal authorities. The house so advertising may remit the quoted price, and there may also be purple pigs and a green cheese moon in the sky, but generally the remittance is from half to two-thirds the amount, together with a letter declaring these particular furs to be "small," "damaged," "rubbed" or otherwise inferior. If the shipper demands their return, he is told it is too late, they have been passed into stock, that they "were sent without instructions" and many other perfectly tricky things.

During the past season a St. Louis house was asked for its quotation sheet and a list was received with numerous headings purporting to define the classifications and the prices guaranteed for same. Taking the section referring to coyotes, here is the way these columns and the quotations read: "No. 1 Large Fine, $17 to $15"; "No. 1 Medium Fine, $12.50 to $11"; "No. 2 Large, $10 to $7.50."

From a shipment sent in response to these quotations here are the returns that came and with the other are now in the hands of the Post Office Department: "No. 1 Large Fine, $8"; "No. 1 Medium Fine, $4.75"; "No. 2, Large, $4." The house refused to return them, claiming the skins had been resold at a profit of $6 for the lot, worth, under its own quotations, $118.50. It paid a total of $65.

A North Idaho prospector, who trapped marten in the high mountains as a side line to provide a grubstake, sent a few skins to a Minneapolis house operating under an American name and front. He received $3.50 apiece for them. Being from Nova Scotia, he laid a plan to go into the matter further. From among his fellows he bought 100 marten skins and set out for Minneapolis. Entering the house which had received his previous lot he pretended to want to buy marten skins. He was fenced and stalled for an hour and a half and could not pin them down to talk business. Finally demanding to see their skins he was shown a few pale ones, not equal to the ones he had shipped, and insistently demanding a quotation he was finally told $18. Then the Nova Scotian turned on them and rehearsed the $3.50 transaction, relating that he had 100 more and asking for an offer, but was refused. He sold them for around $10 apiece to fur manufacturers at that city, who said they were glad to get them.

These schemes of the fur buyers are having the distressing effect of exterminating harmless and highly valuable animals. They quote extravagant prices, induce many people to undertake killing, and then pay half and less the amounts quoted. Mink, which were previously plentiful in every state and which ten years ago brought the trapper about $3 average, are today quoted at $10, $12 and even $15. But when 10 mink are killed and the shipment made, the trick is turned. The fur house will send back an invoice reading about this way: "One mink, No. 1, extra large, $15—Nine mink, small, pale, at $1.50; $13.50—Total, $28.50."

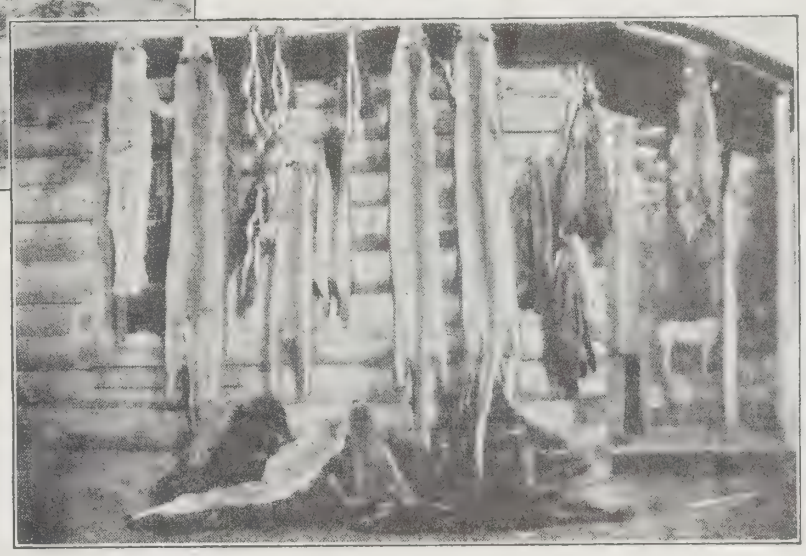
Muskrats, which formerly brought 50 cents as a top price, are quoted at $3, or thereabouts, yet when shipped the whole lot brings $3 and the returns are so figured as to make the lot average little if any more than the former price of 50 cents each.

Coyotes the past winter were recklessly quoted at from $25 down to $10, but actually brought from $5 to $8.

Fraud is plentiful in the raw fur business as it is handled today, yet 99 per cent of that business is transacted through the mails. Every trick known to the art of deception is practiced and carried on unblushingly and unhindered by the inspectors who are supposed to apprehend those who use the mails to defraud.

By putting in motion the detection machinery of the Post Office Department, a useful purpose would be served, besides enforcing honorable dealings with a hard-worked class of men—the rapidly vanishing fur bearing animals, an invaluable asset to man, would be saved from perishing from a fraudulently stimulated trapping activity.

The clearing up of this matter would have a far-reaching effect on the prices paid for furs and on the fur trade generally.



Three mountain lions, two lynx cats, two bears and other furs secured by Idaho hunters.

Farm Business Improving

THE wheat and oat crops of 1924 showed a material increase over the corresponding crops of 1923. Coupled with this is an even greater proportional increase in price. In the case of wheat this is due largely to foreign crop failures. The world crop is short by 570,000,000 bushels; Canada's 1924 crop is 200,000,000 below that of 1923, a decrease of more than one-third. In wheat the change in average price from 1923 to 1924 approximates 25 per cent and upward; the American crop increase is from 786,000,000 to 857,000,000 bushels. The two factors of quantity and price indicate a total increase in crop value of more than one-third in both wheat and oats.

The cotton crop of 1924 was reported in the yearly estimate made on November 14 by the United States Department of Agriculture as 12,992,000 bales. The amount ginned up to November 14 was given as 11,148,000 bales which was exceptionally large due to the fine autumn weather. The price of cotton fell but the sale value of the total crop remained about the same as that of the banner year of 1923 when cotton went above 35 cents. All in all more general prosperity was attained by the cotton around 22 cents with the larger crop than at 35 cents which was a prohibitive price for many industries and for consumers.

No two crops account for general prosperity, the country over, more than wheat and cotton. The corn crop of America totals more in value than wheat but a larger proportion remains on the farm and the value for the farmer is largely a matter of bookkeeping and of pork. In 1924 the decrease in production of corn was offset by the increase in price.

The potato crop is approximately the same as 1923 but the price has fallen a quarter. The tobacco crop was materially less, falling from 1,491 million of pounds to 1,182 million, with the price about the same. Cattle and hogs returned to the farmer more cash during 1924 than during 1923.

On the whole the farmer had more money to spend during 1924 than during 1923 and, further, other commodities fell slightly giving greater purchasing power to the farmer's dollar.

The larger prosperity of the country depends upon a few crops only. A slight increase in price to the consumer frequently accounts for the difference between hard times and good times. When cotton falls to eight cents, as it did in 1914, or when wheat falls violently in price, this spells disaster and bankruptcy for hundreds of farmers. The effect upon other industries in the United States is almost immediate. The purchaser of flour and cotton, which means all of us, must remember that fair prices account for the continuance of many jobs which are kept going by the northern farmer with his wheat and the southern farmer with his cotton.

An Official Feminine Ambassador

THE Russian Government has recently appointed as ambassador at the Court of Norway, Mme. Alexandra Kollontai. This constitutes a promotion for Madame Kollontai who has acted for two years as chargée d'affaires at Christiania. This creates a feminine ambassador, the first on record.

Madame Kollontai, daughter of one Russian general and widow of another, is a revolutionist of long standing. In spite of her Bolshevik connection the furs and the jewelry which the lady ambassador wears to official functions and at social gatherings do full justice to the high office held.

The recognition of the Bolshevik government by Norway and the successful negotiation of a credit in Norway for the purchase of herring are both attributed to successful feminine diplomacy, long known only domestically.

Elsie Singmaster, Interpreter of the Native Pennsylvania Types

By JOHN DAVIS ANDERSON

ELSIE SINGMASTER.

"MARY BOWMAN"

"She has seen beauty change to desolation, trees shattered, fields trampled, walls broken, all her dear, familiar world turned to chaos; she has seen desolation grow again to beauty. These hills and streams were always lovely, now a nation has determined to keep them forever in the same loveliness. Here was a rocky, wooded field, destined by its owner to cultivation; it has been decreed that its rough picturesqueness shall endure forever. Here is a lowly farmhouse; upon it no hand of change shall be laid while the nation continues. Preserved, consecrated, hallowed are the words and the lanes in which Mary Bowman walked with the lover of her youth."—*Elsie Singmaster.*

RURAL communities must ever attract a certain proportion of authors capable of writing forcefully and with distinction. Generally speaking, however, the field remains a neglected one. There is today entirely too much of the city and the big town in our fiction, and not enough of the little town, the village and the countryside. No American writer has yet done for our thinly populated sections what Thomas Hardy has done for Dorset, Devon, Berks and Wilts—the "Wessex" of the south of England, nor what James M. Barrie did for Scottish village life in the early days of

Typical farmhouse and buildings of the better type in the Elsie Singmaster country.

his writing, nor yet what several of the French authors have done exceedingly well.

There are hundreds and even thousands of localities in the United States, and in older countries, where outstanding characters may still be found. These are fields which await cultivation—communities which are inhabited by elemental types, people—as some one has described them—"with the bark still on."

These after all are the sort of human beings who have furnished the material for stories which contain lasting, enduring character-painting and who have been sought out and pictured by the greatest of fiction writers.

Just as Hardy has kept his readers to a small section of England—that part of England of his birth, of his maturity and of his old age—so has Elsie Singmaster chosen a background as rich in all ways, although perhaps not so physically picturesque as the Hardy country. Her region is formed by four or five Southern Pennsylvania counties originally settled chiefly by Germans and Swiss—that same land traversed in part by the Confederate Army when it made its northward dash in the summer of 1863. With this section, fertile and beautiful, she is thoroughly acquainted and she has wisely confined herself to it. Here we find not only the heroic soil of the Battle of Gettysburg, but equally interesting localities occupied by some of the quaintest people to be found in the whole United States—the Dunkers, Seventh-Day Baptists, Mennonites, Moravians and Amish, along with many smaller sects. Miss Singmaster has never been far separated from this region save during her college days.

It is a long way in point of distance from the Haworth of the Brontes or Jane Austen's Hampshire vicarage, to the Lutheran parsonage at Schuylkill Haven in the Blue Ridge Mountains where Elsie Singmaster was born. However, the quiet daily routine, the atmosphere of books, and the wise and friendly interest in fellow human beings characterize the best of country parsonages in this land as well as in England.

Her father, the Rev. Dr. John Alden Singmaster, still active and vigorous, is of Dutch and Pennsylvania German descent. Her mother, who comes of an English family long established in Pennsylvania and Maryland, heard the guns during the three days' Gettysburg conflict.

From the high school at Allentown in her native state, in which town a part of Miss Singmaster's childhood was passed, she went to Cornell, where she entered with the class of 1902. It was about this period that she developed a fondness for writing.

After her second year at Cornell, Miss Singmaster went with her family to Gettysburg where her father had been called to the presidency of the Lutheran Theological Seminary, now Gettysburg College. The end of her first college days did not mark any lapse in literary endeavor. Her work at Ithaca had rather been a stimulation. A part of every day she spent in writing and when she again took up college work—this time at Radcliffe—it was with a clearer knowledge of the direction in which her talents lay.

In 1912 Miss Singmaster was married to Harold Lewars, a musician of Harrisburg. Three years after her marriage he died and she returned to her old home at Gettysburg.

Her work now enters a new phase. All around her lay the vast battlefield with its fresh and hitherto unappreciated material. She found that this likewise was promptly welcomed by magazine editors. In 1913 nine stories, "July the First," "The Home-Coming," "Victory," "The Battle-Ground," "Gunner Criswell," "The Substitute," "The Retreat," "The Great Day," and "Mary Bowman," were gathered into a volume under the title, "Gettysburg: Stories of the Red Harvest and the Aftermath." The book has had a constant sale, and the stories are classics of their kind. The characterization of "Mary Bowman" especially stands out clear and strong.

All these stories are told from a new point of view—that of the town people who participated in the excitement of battle or who recollect the events which Miss Singmaster has related with just enough of the novelist's art to make them more readable. In "Emmeline" and "John Baring's House," two of her five books for the young, she has used the same heroic background.

"Katy Gaumer," which appeared nine years ago, was, with the exception of Miss Singmaster's earlier work and short stories, contained in "Gettysburg," the first getting away from story writing for young folks. In it she justified the expectations which her short stories had aroused, and it has been described as a beautiful love story and possessed of the flavor which has made "Little Women" and "Rebecca of Sunnybrook Farm" what they are.

Her reputation as a novelist rests on four books: "Basil Everman," which appeared in 1920; "Ellen Levis," published a year later; "Bennett Malin," her book for 1922, and "The Hidden Road," the last to appear. It is impossible to say which of these stories is the best, for the critics who have praised them all are not agreed.

Miss Singmaster has not written a story with a more original theme than "Basil Everman." The scenes are laid in the small college town of Waltonville "a little north of the Mason and Dixon's line." It is one of those peaceful, pleasant places, well out of touch with the commercial world; a bit more quiet perhaps in the days to which it relates thirty years or so ago than at the present time. Basil Everman had run away from the college town and from the life of mediocrity to which he was destined. His death occurred suddenly in Baltimore before he had more than reached maturity. Before he passed away he wrote two marvelous stories and it is around this heritage that most of the book centers. His sister had married Dr. Lister, president of the college and the successor of Basil's father. This sister's love for her brother was of the most intense character. His estrangement from his family is her abiding dread, especially as she has found some of his unpublished manuscripts. Lest these be discovered, printed, and the incidents of his life made more fully known, she tries to destroy them. *The stories are worldly and the family would be quite undone by their publication.*

But her brother's misdeeds are by no means the sole cause of her fears. Her son Richard seems not unlikely to fall into the Poe-like life of his Uncle Basil. He has resolved to be a musician, but Mrs. Lister's intent is to make a clergyman of him. Mother-like she is quite unable to see that her dear Richard is being treated quite as was her brother and with the same inevitable results.

The village innkeeper's daughter, Margie, made her exit from Waltonville coincident with the time when Basil disappeared. A Mrs. Bent—the same person—has, after a lapse of years, returned to Waltonville with a beautiful daughter with whom Richard Lister promptly falls in love, quite unaware that she may be his first cousin.

Throughout the narrative even the minor characters are painted in such a way as to make them lastingly remembered: Thomasina Bent, the music teacher who indicates to Richard that there are ways of being quite respectable without being a clergyman, and Dr. Green, who clears up the mystery of Eleanor Bent's paternity.

Basil Everman, despite the fact that he has been dead many years when the story opens, dominates its incidents, and there are no superfluous characters. In this book she has produced the best type of fiction, and one that has widened the horizon of human sympathies.

"Ellen Levis" is another of her outstanding novels.

(*Concluded on page 13*)

Small town house built of limestone in the region about which Elsie Singmaster has written her novels and stories.

"Babe" Ruth's Rise as a Star Among Stars

Baseball's Brightest Lights Reached Their Position Through Accident

By PAUL MACDONALD

IT IS a peculiar contradiction of what is generally known as the "dope," that some of baseball's greatest stars were elevated to the front rank by accident rather than through a combination of natural circumstances.

For several years George Herman Ruth, affectionately known as "The Babe" among the followers of the game, has been the greatest individual attraction in sport. Ruth, himself, brings more people into the ball parks of the American League than any single player ever lured through the turnstiles. He is a powerful attraction because he is the greatest slugger of all time. He can hit a ball farther than any other player ever did. The public likes the punch in sport, the wallop, the kick. Ruth supplies the public with what the public most likes to see.

But Ruth gained his present position through sheer accident. He was a member of the Boston Americans. He came to them from the Providence team as a pitcher. When Ruth joined the Boston pitching staff it was one of the best in American League history. And Ruth soon became a star among stars. He developed into one of the best left-handed pitchers in the game, a pitcher with a dazzling fast ball and excellent control.

"Babe" Practiced Batting

BOSTON was the best team in the American League. It reigned its circle but reigns in baseball are comparatively short and there came the day when the Boston team started backward. The club was sold and then several players were sold by the new owner. Ruth stayed. He continued pitching. But some of his illustrious mates of the pennant-winning days were missing from the lineup and Boston, once a proud leader, became a losing team.

All hope of Boston returning to supremacy vanished. Boston was out of the pennant-winning class. There was no hope of Boston becoming even a contender, so Boston had opportunity to experiment and teams that are hopelessly outclassed can afford to experiment; those that are contenders can never experiment.

It was then that Boston experimented with Ruth. He was an excellent left-handed pitcher but he could also hit. He had always been able to hit as a pitcher. Boston saw an opportunity of making Ruth more valuable to the team by giving him a chance to develop batting ability. Boston needed batting strength with Tris Speaker and some of her other sluggers of championship days gone from the lineup.

Ruth was given his chance. He was told to practice batting. Ruth did. Always able to drive a ball a long way he now worked on his swing and got even more lift and carry to his drives. He was soon on his way to making home run records. His slugging caught the public fancy. He became a drawing card. He had a big season. New York, scenting the possibilities of Ruth as a gate attraction, bought him for $125,000, a sum that the Boston owner absolutely had to have as part payment on a note that was due. New York played Ruth in the outfield, gave him a chance to take his regular turn at bat and Ruth delivered. What Ruth has done since joining the New York team is known to every follower of baseball.

Given the same opportunities other players could probably be developed into home run hitters. Ruth would find several strong rivals in the lineups of his league today if the situation made experiments practical. Players on teams that have a chance to finish at the top, or near there, cannot experiment on long distance hitting. They are sent to bat to hit the ball into safe territory. Their task is to get hits, not home runs. If they can get four-base hits so much the better but they cannot go to bat with the sole purpose of hitting for distance; they must hit for safety.

Had Ruth been on a winning ball club; had the Boston team continued as a winning combination, or had he been on a team that needed his pitching most of all, Ruth probably never would have become known as the "Home Run King." He would never have developed into baseball's greatest drawing card at a salary of $52,000 a season. He would have gone into history as one of the best left-handed pitchers of all time, but nothing more. A losing team gave Ruth his opportunity, a winning team prevents other men from getting the same chance.

Harry Heilmann, of the Detroit team, a right-handed batter who has twice led his league in hitting, could probably rival Ruth's home run record. Heilmann, according to many ball players, hits a ball as hard as Ruth. It was suggested to Heilmann one day that he change his swing and go after Ruth's mark and his answer is illuminating:

"I'm out there to get hits. I get all I can. I don't try for distance. All I try to do is to drive the ball to safe territory. I might get a lot of home runs. I probably could but I would have to change my style at bat. I would have to hit the ball higher to get more carry to my drives. If I did that I would not get as many hits. The team demands hits. And, anyway, there is just one ball player in the world that is being paid for hitting home runs. That is his specialty. Maybe you could hit as many as he does but, what of it? He has established himself as the one home run hitter and he'll continue as that one."

There are several players who have come near the Ruth record. Rogers Hornsby led the National League. And the two Williams—Cy in the National and Kenneth in the American League. But none of these sluggers has taken the glory of Ruth in the eyes of the crowds although they make the going close in the batting records. Ruth still manages to occupy the position of the leading headliner of the sport.

Among infielders Eddie Collins holds a queer position. Collins is the best second baseman in years. Napoleon Lajoie, who also played the position in the American League, is regarded by some as the greatest second baseman of all time. Still others believe that Collins is better than Lajoie was. Suffice to say that few men have ever been in the class to which Collins belongs.

The Marvelous Collins

NOW Collins, physically, is just about everything that a good infielder should not be. He is slight of build, one of the smallest and lightest men in baseball. His hands are refined, almost delicate. He lacks grace and form. He has none of the essentials that are so desirable in infielders. Physically he compares with none of the leaders of the position who stand out of the past. Even Johnny Evers, considered extremely light for the position, was a much bigger man than Collins. And still this man Collins has been for years the outstanding man at second base, probably the most important position on a team, surely the most important outside the battery positions.

Collins is one of the best batsmen, one of the best base-runners, one of the best fielders and, best of all, one of the most intelligent players of all time. None can deny these qualities in him. He is not a player who flashed in one year or two, but for years he has been so consistently the leader of his profession. One of the veterans of the game, he is playing as well now, apparently, as he ever played. He is one of the most interesting studies in sports, a phenomenon.

Few good second-base recruits have come up in the big leagues in recent years. Collins is said to be responsible for this. Collins is the leader at the position and major league scouts, sent into the minors and college fields to discover material, keep Collins in mind as their model. They tried to find another second baseman, or other second basemen, like Collins and they failed. There does not happen to be another like him and there probably never will be another just like Collins. In him there is a rare combination of qualities. In him are gathered apparently so few but in reality so many of the essentials needed in great ball players. His hands are small, almost delicate, but where in baseball can you find surer hands than those of Collins? He is awkward, utterly lacking in grace. He shuffles along with a peculiar walk, seemingly dragging his feet. But where is there a second baseman that can cover the ground he covers? Where is there an infielder that can run bases better than Collins? Or an outfielder for that matter? He has speed and he has the proper stride, and judgment. He knows how to get the jump, how to run and how to slide.

Compare Lajoie and Collins! Lajoie was big and powerful, a wonderful specimen of manhood. He was strong. He was a great slugger and he should have been, for he had all the physical qualities. In fielding Lajoie was the poetry of motion. There was grace in every movement. His form was the nearest to perfection that any infielder ever exhibited. But Collins is probably even a better fielder than Lajoie was.

Collins is really one of the freaks of sport.. It is doubtful if the game will ever produce his like. At least the scouts that have been searching for years for another like Collins have failed to find anyone that resembles him.

Ty Cobb Not an Accident

TY COBB was considered a freak when he began creating his remarkable record. Cobb was of slight build and light. He lacked power. He was not strong. But Cobb was young and weight came with the years. When he reached the pinnacle he carried the ideal build.

Cobb was neither an accident nor a freak. He has a remarkable mind and it is in intellect where he outdistances the field. Cobb's physical performances were the result of deep study and hard work. He practiced constantly, the kind of practice that is dull, monotonous, wearisome and often torturous. Cobb often relates how he practiced sliding until his uniform was soaked in blood. He has played games where he was covered with gauze and adhesive tape at the hips and thighs to protect wounds made by "hitting the dirt." It was a long and steady grind that developed Cobb.

As a boy Cobb wanted to be a runner. He secured several books on the subject, the works of leading track coaches. He followed out their instructions. Cobb ran from two to three miles every morning before breakfast. He developed wind and stride, important in baseball, particularly the stride. So, when he entered baseball, he had a fairly sound foundation. The other accomplishments came as the result of hard and consistent effort, as related. Briefly, the reason Cobb went to the top was because he thought so much faster and better than other players.

Mordecai Brown, better known as "Three Fingered" Brown, was one of the best pitchers of all time. He ranked close behind Mathewson when that super-pitcher was at his best. Brown's chief asset was a curve ball and this was the sharpest breaking curve that baseball has ever seen. But the curve was the result of an accident. The forefinger of Brown's pitching hand was amputated. Only the stub of the finger remained and it was this stub that gave the curve ball its remarkable break. The stub enabled him to keep a firm grip on the ball until the last moment before it left the hand, putting the extra sharp twist on it without taking away any of the speed. So, the finest curve ever pitched came out of a crippled hand.

Tris Speaker is the best throwing outfielder of all time. Opinion on this point is unanimous. Speaker has repeatedly thrown out runners trying to score from second with throws from deep centerfield. Speaker's throws nearly always are direct, coming to the catcher on a line.

When Donie Bush was at the height of his career as a shortstop, he tried to score one day on a long single to center by Cobb. Bush was a fast man and an expert base runner. He had a big lead off second and he went at top speed all the way. When he reached the plate the ball was there ahead of him and Bush was tagged out. "Speaker threw a perfect strike over the plate from centerfield fence and nailed me," said Bush. But Speaker nearly always threw strikes in pegging for baserunners. The catcher rarely moved out of his tracks to take the ball.

The peculiar part about Speaker's throws is that he curves the ball. Any time he throws from a natural centerfield position the ball curves from twenty to twenty-five feet. Thus, while Speaker is the greatest thrower of all time he is also the freakiest in history. No other outfielder ever curved a ball like that in throwing. The curve is not intentional with Speaker; it is simply the result of his style of getting the ball away. He himself cannot explain why the ball curves as it does but it certainly curves. When Speaker throws to the plate one, if he happens to stand or sit back of the catcher, imagines it will cross the base line between third and home, but it always curves to the catcher's mitt. Speaker can curve a ball ten times as wide as any pitcher and control his twenty-five-foot curve as well as the pitcher controls his twenty-four or thirty-inch curve.

Nature, fate, accidents, and circumstances have played their part in developing some of the greatest of diamond performers, as these few instances show.

Elsie Singmaster, Interpreter of the Native Pennsylvania Types

Concluded from page 12

It contains some of the very best work which Miss Singmaster has done. It is written in elastic style, yet solidly woven, and is told in the old-fashioned manner to a greater extent than in any of her other works. For her material she went to one of those villages of the Pennsylvania Germans who still held to primitive religious beliefs.

In "The Hidden Road" we have Miss Singmaster's more mature work. In it there is a clear gain in power and in breadth. It is better finished and more subtly conceived than any of its predecessors.

Miss Singmaster has found time to write a biography of Martin Luther, which appeared in 1917, upon the four-hundredth anniversary of his nailing his thesis on the church door at Wittenberg. The book forms a concise and accurate account of the life of the great reformer. She has also made much progress as a short-story writer, using the Pennsylvania of her novels as the scenes of their action.

Miss Singmaster is methodical in her literary habits. By eight o'clock each morning she is at her desk in her study, working until noon. Before her is a fine view of much of the battle ground with the prospect ending at Big and Little Round Top, with two or three miles of intervening space dotted with monuments marking many of the events on our most memorable field of conflict.

She never starts to write a story until introduction, incidents and conclusion have taken form in her mind. Miss Singmaster commends this method to young writers. As to her methods of correction and revision she has this to say: "The long cultivated habit of careful planning obviates the necessity for extensive revision. I write out a chapter of a book or a short story on my typewriter, usually devoting a single page to each paragraph, so that it may be shifted with a minimum of trouble, if necessary, and then lay the manuscript aside for a day at least. Then I make corrections, reading aloud often more than once. The ear frequently detects errors which escape the eye. Sometimes I call upon a member of my family or a friend to act as auditor. The mind of another person, whether or not it expresses itself in criticism, is an exceedingly valuable mirror."

In a good many of Miss Singmaster's stories we find the theme of education and she told me that she believed this was due to the fact that she has always lived in an atmosphere where scholastic endeavor played an important part.

It is doubtful if Miss Singmaster would have achieved success in writing of the Pennsylvania Germans without a knowledge of their language. Such knowledge she regards as necessary to an understanding of their lives.

Miss Singmaster tells her own stories in her own way. "I have never," she said, "had any advice from editors or publishers."

Cranberry Bogs of Cape Cod—Their Workers

Concluded from page 9

Cape Verders are employed in the cotton mills probably at all times. However, at present because the cotton industry is slack, they are employed only on night work, "since it is now possible to fill all day positions with white workers." These are mostly English, French Canadians, and Azorean Portuguese. Similarly, the cotton mills of Fall River and other towns make use of Cape Verders, but racial competition is frequently against them.

About seventy men and twenty women are constantly employed by the New Bedford Cordage Company where they do as good a grade of work as any race and where they receive the same wages.

They also eagerly seek employment in the iron and machine plants—as in Providence, Hartford, and Bridgeport. In Boston they seem to do a more general type of work than in the other cities; there they carry the hod, work on wharves, and do any kind of day labor.

A scant hundred of them follow the profession of the fisherman. Half a dozen families are so employed in most of the coastal cities of Rhode Island and Massachusetts. They are gradually being crowded out of the fishing business.

The domestic cranberry, as well as the wind-driven toy, is a Cape Cod product. About 1820 it began to be domesticated at North Dennis, Massachusetts. Only from about 1850 was it an assured and real success. Today a total of about 30,000 acres of cranberries are annually harvested in the United States. Massachusetts, in her Cape Cod area, has from 14,000 to 18,000 acres of this total—the acreage varying annually. Cape Verders have been working in cranberry bogs for about thirty-five years, and today they harvest nine-tenths of the Cape Cod crop. Consequently, if at a holiday dinner we think of any one group of people as having contributed most of the cranberry part of our repast, the Cape Verder is the man to have in mind. Over and over again, and without contradiction, owners and overseers of cranberry bogs pronounce the Cape Verder, whether he picks by hand, scoops, or snaps, the very best harvester of cranberries and spreader of sand with the wheelbarrow, on the Cape Cod bogs. Because he is superior at these, the intensive parts of the cranberry industry, he has entirely taken the place of the hired old-line American, and all but entirely that of the Finn, the Pole, the "white Portuguese" and the Italian who still now and then takes a hand at the harvesting. We may note, in passing, that it is rather fitting that the Indian who gave our Pilgrim ancestors the idea of turkey and cranberries should still be associated with the harvest. Within ten miles of Plymouth, on the bogs of Mrs. Carleton, a few Indians come down annually from Maine and harvest her crop side by side with Cape Verders.

Finns, because of their greater initiative, are preferred as builders of the bogs, that is, as clearers of the land of trees, stumps, and brush, and as movers of turf and makers of ditches and dikes. However, several of the largest bog corporations on Cape Cod employ 50 or 60 "Bravas" the entire year who, under expert direction, do all the work connected with the cranberry industry, such as building bogs, planting, draining, flooding, weeding, sanding, fertilizing, harvesting, grading, sorting, packing, storing, and shipping, as well as preparation of layers or plants for establishing new bogs. At least one Cape Verder is a professional and successful builder of bogs. The usual work in connection with cranberries is seasonal and lasts for about six weeks on most bogs, beginning early in September. Some owners with both early and late varieties have pickers for longer periods. Today about 25 per cent of the seasonal harvesters are women.

Cape Verders have brought to America the passion for land that they possessed in Fogo and Brava, and many of them own small bogs. Dr. H. J. Franklin of East Wareham, superintendent of Massachusetts State Cranberry Substation, believes they do not own more than 100 acres all told, but they have made a start in the direction of ownership.

Irving C. Hammond, a bog owner of Onsett, estimates there are 20,000 Cape Verders in Plymouth and Barnstable counties. Half of those are in rural sections with separate houses on small farms, or in groups of 50 to 100 persons in a small community of separate houses. Such typical communities are the one in Bassett's Lane between Harwich and Brewster, and the one on the Sandwich road between Falmouth and Sandwich. The women care for the home gardens and the men work in mills when possible—always, however, a majority of them come back to the bogs each season, considering cranberry picking their vocation.

Cape Verde men are rated as particularly fit and strong during their prime—which, however, some employers say is of short duration for many. The women marry young and many are mothers long before they are out of their teens.

Employers, educators, social and religious workers, in whose hands quite directly most of the New England Cape Verders are, as a group appear consistently to distinguish them as follows:

They are industrious, are always working or seeking work, and no one accuses them of being lazy.

They are decidedly thrifty, beginning to save as soon as they earn money. Their bank savings are the subject of frequent favorable comment by those who know them. A goodly per cent of their savings goes back to their friends in the Islands, of whom they are particularly thoughtful. Most consistently a per cent of their savings goes to buy land for "farms." Sacrifice for ownership of a "farm" is perfectly natural to a "Brava."

They are law-abiding, having long been so trained. Old accounts in the Islands state that murders and thefts are extremely rare there. Practically the only cause of dispute is over land boundaries between the small and highly prized pieces of arable lands. In New Bedford their police records are good—much better than those of some other foreign groups. Every handler of gangs of foreign labor will understand and appreciate the manager's words who told me "the Bravas are easy to boss." They are obedient to commands and instructions. Unfortunately those who have been in America for some time cannot always be so well characterized. In employment their rate of turnover is low.

They have a very consistent reputation for honesty, and their credit is good. A promise to come to work at a definite future time may be depended on; and a promise to pay is equally good. I sat for two hours in a store whose business is largely a credit business with Cape Verders. The happy good-nature of debtors who came to pay their debts was a genuine surprise. It was as a social event between intimate friends.

In common with many other foreign groups in America their children are usually taken from the public schools as soon as they have fulfilled the requirement of the school-attendance law. Some, however, have attended high schools, and a few have had advanced professional education. They have produced two Congregational preachers among their own people. They have at least three lawyers, two physicians, and two dentists. One man, now 40 years old, organized their successful Benefit Association which owns its own building in New Bedford, and has most of the time a membership of about 1,000. It serves the social, educational, and recreational needs of the Cape Verders, and provides sickness and death insurance. One of the things of which its organizer and manager is most proud is that since 1908 it has, except for one year, won its annual game of cricket against the team of Englishmen of the city. In the World War there were one captain and one sergeant who were brothers. In the old whaling days there were at least four captains of whaling vessels. One Cape Verder, who for twenty years was manager of extensive Cape Cod cranberry bogs, was especially described as constantly exhibiting unusual ability and qualities of initiative and constructive leadership.

How Old Is the Cross-Word Puzzle?

Concluded from page 2

To come back now to our original question, What is the meaning of the craze which has apparently swept us off our feet? We Americans are notorious for our fads. From a psychological standpoint, as I have already hinted, a national fad is merely a vent; it is a certain measure of relief from humdrum. As far back as I can remember we had the roller skating fad. This left some remains, and there are still roller skating rinks. This was succeeded by the bicycle fad, when the rubber compressed-air tire was invented. I can recall quite vividly, every morning on Riverside Drive, New York, in 1893, a long succession of distinguished citizens on wheels, cycling to their offices. In those days the man who paid $125 for his wheel was considered something of an aristocrat. The ping-pong craze came later. I once sprang a dark horse ping-pong expert on a flock of New Jersey ping-pongers. He won by a close score at midnight, and the reverberations of that enormous contest echoed and re-echoed for months thereafter. A recent attempt to revive ping-pong has met with small success. This shows plainly that what one generation likes is not for the next one. Sam Lloyd, first and second, who were both puzzle geniuses, produced puzzles which had a wide vogue, the Fifteen and the Pigs in Clover, if I mistake not, yet the difficulty with these for lasting purposes was that once having solved them, they could not be perpetuated.

The recent attempt to make Mah Jongg into a fad had all the elements of success, but the emotionalism it created was a false emotionalism. It was defective not just because it was complicated but because it was complicated in the wrong manner. People will learn to do anything, no matter how complicated, if the learning is interesting and progressive. Games that continue from one generation to another are thus subject to certain mind-laws. Poker with its variations is always poker, but it has small appeal outside the gambling element; it is this element which leads players to become experts at bluffing. Bridge, which is also a gambling game, yet has certain other qualities, changes all the time, that its interest may progress. Thus new plays are constantly introduced, as doubling a no-trump, or taking your partner out under certain conditions which a few years ago were not considered as a possibility for signaling.

The cross-word puzzle differs from all these fads I have mentioned, outside of games, in important particulars. That faculty which, in our youth at least, we all possess, namely the inventive faculty, has, on a very broad scale, undoubtedly become latent in us as a large group of human beings. Labor-saving devices have been carried to such a point that we scarcely do anything for ourselves any more. In a short time, doubtless, we shall, by taking a few steps, be transported through the air from home to office; already we have at our fingers' ends all the means for communicating without effort. We may say of the cross-word puzzle, therefore, that it becomes prominent among us at a moment in our history when we experience a feeling of revulsion over the various paternalistic influences to which we submit. In short, we want to break loose and practice a little thinking for ourselves, even if it does not seem to lead anywhere. It is undoubtedly good practice. To be able to use our brains once more, when there was every indication that brains were becoming obsolete—no wonder we are excited about such an innovation! Furthermore, it must be allowed that the faculty for imitation never had a better incentive. The power of suggestion steps in and everybody does it because somebody started to do it.

As to whether it will last, the reply to this may be put in the words of the old Persian king, who, when one of his courtiers came to him with a hard-luck tale of his troubles, and the burden he was obliged to sustain, shook his head and remarked sententiously, "Everything passes."

It only remains now to define the malady:

The cross-word puzzle is an intensively rectangular but essentially heterogeneous concatenation of dissimilar verbal synonymic similitudes, replete with internal inhibitions, yet promulgating extensive ratiocination and meticulously designed to promote fulminative vituperation, dispel hebetudenosity and develop speculative, contemplative, introspective, deliberative and cogitative faculties.

Here is a sample of the cross-word puzzle, as it ran in *St. Nicholas*, week after week. This example is taken from *St. Nicholas* of December, 1879.

EASY CROSS-WORD ENIGMA.

My first is in pencil, but not in slate.
My second is in post, but not in gate.
My third is in sun and also in sunder.
My fourth is in silent and also in thunder.
My fifth is in John, but not in Frank.
My sixth is in office, but not in bank.
My seventh is in friend and also in foe.
My eighth is in high, but not in low.
My ninth is in cane, but not in staff.
My tenth is in wheat, but not in chaff.
My whole is a very useful thing.
It serves the poor man and it serves the king.
'Tis sought by all, girl, boy and man.
Now guess this riddle; that is—if you can!

MAMIE L. W.

The answers always followed in the next number. The answer to this is "Post Office."

"I Read in the Papers—"

I READ IN THE PAPERS that Mr. Hoover (with picture) is going to do this and that (with picture) and I have fallen into the habit of making a list of the things which Mr. Hoover (with picture) is going to do, in the hope that some day I may be able to parallel it with an equal or partial list of the things which Mr. Hoover (with picture) has really done. The second list still yawns vacantly. I wonder how long Mr. Hoover thinks he can get away with it? And who takes so much pains, especially with the picture? Is it true, then, that H. H. has his eye on 1928? Let him take it off. That way lies bitter disappointment for him.

I READ IN THE PAPERS that President Coolidge wishes us to keep cool on the question of national defense. We probably shall—unless—the superheated ones have facts enough to fire the nation. I asked one authority if it is true that our Navy is below par. He replied, "It never was up to par." For the time, the President's counsel is wise—we should avoid uninformed fear on the one hand, and the wiles of militarist propaganda on the other, but we should stand steadfastly for an adequate national defense. The best reason Mr. Coolidge gives us for keeping cool is that he is going to study the question personally in the light of all the facts both from home and abroad. Very well: that will content us. Mr. Coolidge evidently knows that a dose of facts is the most appreciated remedy in the whole political pharmacopoeia. If he deals with us always on the basis of facts, we shall get along.

I READ IN THE PAPERS the report of a sermon by a clerical friend of mine, and immediately I knew what magazine he read. It was the *New Republic*. Clergymen can't make the rounds as other men do, so they have a vice which they indulge in secret—they read the *New Republic* or the *Nation*. That is one reason why people don't attend the churches of clergymen who live off the magazines. Why do clergymen, especially, read these two magazines? Because it gives them a point of view. Many people, especially those who cannot think for themselves and yet are under the professional necessity of speaking for others, imagine that a *point of view* is the *scene* itself. It isn't. Many of this same class think that because an idea is an *Idea* that it is true. They are famished for *ideas*. Any idea not positively disreputable seems a godsend to them. But an idea may be stimulating, beautiful, good, even helpful, and still not true. And fifty ideas, all different, all on the same subject, may be just as stimulating, beautiful, good and helpful, and still just as far off from the fact. Untruth is usually much more fitted for pulpit use than is truth—for truth has Biblical sternness, Biblical brusqueness, Biblical unpleasantness of candor, don't you know, which may account in some degree for the widespread disappearance of the Bible from the pulpit. But you can spot a *New Republic* or *Nation* preacher as soon as he speaks.

Bridging the Gap Between College and Job

Right Man in the Right Industry and Occupation for the Undergraduate

By HARRY H. DUNN

Upper left—Robert Sibley, executive manager of the California Alumni Association. Upper right—Miss Esther Parsons, manager of the Bureau of Occupations of the California Alumni Association. Center—The Henry Morse Stephens Memorial Building, on the campus of the University of California. Oval—Airplane photograph of the University of California.

THE greatest problem which confronts the manufacturer, the distributor, the builder, the engineer, and the exporter of today is the finding of trained men and women competent to carry on the details of his industry. The greatest problem confronting the college or university-trained man or woman today is the finding of the job into which he or she will fit with the least possible delay, the smallest amount of friction, and the greatest efficiency because of the character of the education each has received.

In an effort to solve this problem, in an attempt to bridge the gap between the sheepskin and the job, the largest organization of graduates of any one university in the world has banded itself together, divided its state into districts, and is raising a fund of $50,000 within itself to bring the captain of industry and the private of education together, so that the world's army of producers may be increased to the greatest degree with the least loss of time and the quickest winning of practical results. This rather large contract is being undertaken by the California Alumni Association, composed of more than 12,000 of the 40,000 who have graduated from the University of California with and since the class of 1873, the first to pass through this institution after the old College of California was converted into the state university which now has 14,061 students, the greatest number enrolled in any university in the world, Columbia being second with 10,308, and Illinois third, with 9,285.

Owing to the fact that 85 per cent of all the men and women who have graduated from the University of California have remained to reside permanently in that state, the alumni association is larger, and yet more compact, and capable of closer and quicker mobilization and action than any other similar organization. Of the remaining 15 per cent of the graduates of this university, 12½ per cent are in other states of the Union, and 2½ per cent in foreign countries. The California Alumni Association, of which Clinton E. Miller is president, and Robert Sibley executive manager, established, in 1918, a bureau of occupations, intended at that time to assist men not accepted for active military service to get into war activities. The work proved so successful that, after the period of necessity for it was over, the bureau was permanently established as a definite department of the association, with offices in the Stephens Memorial Building of the Associated Students, on the campus of the university.

This bureau of occupations has been functioning since that time with the well-defined object of connecting the college graduate, and the undergraduate, with the position which he or she is best fitted to fill. So great has been its success that, during the collegiate year of 1922-23, the bureau placed 3,025 undergraduate men students, and 216 undergraduate women students, in part-time positions, the remuneration from which enabled these 3,241 boys and girls to carry on their educational training. In the same period, it found full-time positions out in the world of work and production for 151 graduates of the university. The placing of undergraduate women in employment during their school life is handled largely by the office of the Dean of Women at the University of California, but the bureau of occupations also aided in this. These figures mean that approximately 23½ per cent of all the more than 14,000 students enrolled in this largest university in the world were helped into employment by the returns from which they were enabled to continue their studies. The bureau of occupations reports that in both the matter of employment for undergraduates and permanent positions for graduates, there are more places than there are men and women seeking work. The service of the bureau falls into three departments, all under the direction of Miss Esther Parsons, manager of the bureau. These divisions are: First, the placement in positions of graduates of the university; second, selection and recommendation to all departments of the university of graduates and undergraduates for clerical and stenographic positions; and, third, the placing of undergraduate students in part-time employment which shall not conflict with their schedules of study and classes.

The objectives of the bureau, which, combined, form in reality the main objective of the California Alumni Association, are to aid the alumni to find positions for which they are fitted by temperament and training, in other words, to "fit the man or woman to the job"; to place undergraduates in work sufficiently remunerative and adaptable so that they do not "flunk out" for financial reasons; to assist employers to get in touch with university men and women of training suitable to satisfy the needs of such employers through a centralized office; to assist students in bridging the gap between graduation and employment; to prove by deeds that the alumni association is back of all its members; and to create new interest in the university as a source of *practical* training for life's work. To these there is to be added soon a sixth line of work, the placing in jobs of those students who fail to complete their college educations because of lack of financial backing, troubles in their homes, or any one of several honorable reasons which annually compel a considerable percentage of students to leave our colleges and universities.

Strange as it may seem to the casual observer, there is a great and growing demand from many employers, especially those in industrial lines, for men and women who have had one or two years of college training. Those young men and women who fail to complete their college courses usually leave their schools with a feeling of depression, and often with the idea that they have made an irreparable failure of their lives. It is to reassure these students, encourage them, and place them in work to which they are adapted by such training as they have received in their stay in the university, that the alumni plans the new effort, one which has not before been attempted by any alumni or other association in this country. It is interesting to note, in this connection, that the number of students who, in college parlance, "flunked out," at the University of California, in December, 1921, was 385, or 4.47 per cent of the undergraduate registration. In December, 1922, this number increased to 463, or 5.48 per cent of the registration, due to the definite and considerable increase in standards and requirements for scholarship, rather than to any marked decrease in the quality of scholarship of the students so leaving the university. Among these disqualified students 364 were men, and 99 women, representing 7.445 per cent of the men students enrolled, and 2.779 per cent of the women. This does not, however, indicate, as might be thought at first glance, that the men represent a lower scholastic standing than the women, but is explained by the fact that in the technical colleges, where almost no women are enrolled, the percentage of disqualifications was highest.

An effort is made in all instances—and usually the effort is successful—to place the undergraduate in his part-time work at employment which at least has some connection with the course of studies he is pursuing. Students in the engineering college are put in drafting jobs, helping around engineering firms' offices, doing the cleaning up work in the engineering buildings on the campus and in similar places. Those from the college of letters and sciences are given work in libraries, in bookstores, in the offices of the university, and so on. Students in the medical colleges usually find work plentiful in the caring for these buildings, in keeping the biological departments in order, and even in the zoölogical buildings. The girl who is getting a "general education," with an idea to marriage and the management of her own home, finds abundant opportunity for remunerative work in the homes of the members of the faculty, and in those of other residents close to the campus. The students at the agricultural college, both at Davis and on the campus in Berkeley, usually have more work offered them than they can do in the hours not needed for study, rest, or recreation.

The same line of thought is followed outside, in the placing of graduates, and men who have had general training without specific education are put in positions in which they may learn more concerning the professions they have chosen for their life work. One bond house in San Francisco employs thirty-five graduates of the University of California, some of whom graduated from the College of Commerce, but the majority of whom came from the College of Letters and Sciences. One large public utility corporation has been supplied with fifty graduates of the university, of whom forty-eight are still in its employ.

With the undergraduate work the operations of the bureau have resulted in the increasing of opportunities for the men who wish to support themselves, and, what is equally important, marked improvement in the type of work available for university students. Whereas, in years prior to the establishment of the bureau, students were largely limited to dishwashing, waiting on table, gardening, and similar jobs, today, through cooperation with heads of companies, chambers of commerce, and other industrial and commercial forces, the opportunities for part-time work embrace manufacturing plants, express companies, oil and service stations, automobile repair shops and the driving of automobiles, drafting, clerical work, salesmanship, and a number of other branches, experience in which improves the abilities of the student, in addition to increasing his income.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

A Kansas City judge has threatened to make wife-beaters stand on prominent downtown street corners, under police guard, bearing placards advertising their offense. This is an idea borrowed from China where the practice is centuries old.

More than one and a half million patents are registered every year in the United States.

A Baltimore man has erected a monument to the memory of Adam of the Garden of Eden.

In India there flourishes a species of tree which produces sugary flowers that are used as candies. The petals of the flowers drop from the tree in the early morning and are picked up by the women and children who spread them in the sun to dry. A single tree is said to provide three hundred pounds of flowers annually.

Born as an upright swimmer, a thin, perch-like minnow, the flounder's body soon begins to list either to this side or that and presently the fish is flat. He swims flat and his eye that is directed downward gradually clambers over his skull until it is paired with the other on top of the fish.

When a sewer pipe in Canton, Missouri, became clogged, a snapping turtle was sent through the pipe with a light rope attached to his body. A heavier rope was then put through and the pipe cleaned out.

By a vote of six to one, Florida recently adopted a constitutional amendment forever prohibiting the levying of inheritance or income taxes.

Irrigation canals supposed to have been built by the Uratians in the seventh century before Christ have been found near Erivan in Armenia by archeologists.

The United States Government proposes that the $110,000 to be paid by the Persian Government, for the expense of sending the American battleship to Persia to bring home the body of Consul Imbrie, who was murdered by the Persian mob, be utilized for the education of Persian students at institutions of higher learning in the United States.

There are, on an average, 209 accidental deaths in the United States daily. In a year this amounts to the entire population of such cities as Savannah, Georgia, or Evansville, Indiana.

Two million golf clubs are made in the United States annually.

A small piece of butter left on the plate at the conclusion of each meal contains, say, a quarter of an ounce. If only 40,000,000 out of our population of approximately 112,000,000 waste that much, it is 10,000,000 ounces of butter. This is about 600,000 pounds daily.

Nearly three-fourths of all the mint oil produced in the United States and practically half of the entire world's output is produced in about a score of counties in Northern Indiana and Southern Michigan.

California prohibits the use of the roller towel by law.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Among the ancient Peruvians the emerald was regarded as sacred.

An 1804 silver dollar recently sold for $3,600.

Thirteen years ago two Oklahoma youths were arrested in Washington for attempting to climb a statue in front of the Union Station where they hoped to obtain a better view of the capitol. Today one of the boys, Wayne C. Bayless, is winner in the Congressional race and will this time make a very dignified entry into the city.

A rare Caxton book, "The Chronicles of England" (1480), bound with "A Description of Britain," also printed by Caxton, was sold for $15,500 recently.

Confectionery valued at more than $1,000,000 a day and ice cream at more than $700,000 daily were manufactured in 1923. This is at the rate of $1,000 worth every minute.

Giovanni Papini, writer of the "Life of Christ," declares that he has found positive proof of the divinity of Christ. He states that he will publish his proof in the near future and that it will convince unbelievers completely.

Oa, in Scotland, is said to be the town with the shortest name.

Plans are being made to remove the garret in Heathfield Hall, Handsworth, in which James Watt conducted the experiments which led to the development of the steam engine, to London where it will be perpetuated in the South Kensington Museum. After his death this room was locked and remained untouched for many years, and his tools, benches and leather apron are still there.

The first colored judge in the United States is Albert Bailey, newly elected to the Municipal Court in Chicago. Mr. Bailey, who is a Republican, has been a practicing attorney for twenty-six years, and won his place by a vote of approximately 65,000 over his nearest opponent.

A first edition of Swift's "Gulliver's Travels," dated 1726, sold recently at $3,625 and a first edition of Thackeray's "Vanity Fair" brought $1,925.

A magazine written and edited by lunatics has been started in England. Inmates of the City Mental Hospital at Humberstone, Leicester, put out the magazine which contains both prose and poetry which is never edited or censored by saner outsiders.

The nutmeg of commerce is the kernel of a fruit growing in tropical countries. The fruit is succulent and opens like a capsule by two valves. The tree grows to a height of about twenty-five feet and bears a fruit resembling a pear in size and appearance, and is golden yellow when ripe. The fleshy part of the fruit resembles candied fruit and is often used as a sweetmeat.

A minute and inconspicuous black spider was found living on Mount Everest, higher than any other creature on earth. This spider lived more than 17,000 feet above sea level.

On an R. F. D. route at Meredith, New Hampshire, there is an ingenious traveling mail box that runs on wires, through the woods, the trees having been trimmed to allow its progress from the highway to the farmhouse. When the carrier places the mail in the box he gives the wire a jerk, and a member of the household perched on a stationary bicycle three-quarters of a mile away, pedals the machine and draws the box to its destination.

A special class of officers is to be formed at Lakehurst, New Jersey, by the Navy Department to train commanders for aircraft of the Zeppelin type. The *Shenandoah* and the *Los Angeles* are to be used as instruction ships.

The people of Iceland will not use ash for fuel because they believe that those who sit around such a fire will become enemies.

A primitive tribe in Korea marries by merely shaking hands, according to a Japanese authority. This tribe lives in thatched huts of the most primitive construction and eats only rye, millet and potatoes.

Hamilton Grange, once the home of Alexander Hamilton, is to be preserved as one of New York City's famous landmarks.

France has a Luther Burbank in the person of Professor Lucien Daniel, of the University of Rennes, who has grafted cabbages, lettuce, beans, potatoes and various flowers with the result that new species have been created, the life of the plants prolonged and the perfume of the flowers intensified.

The lowly muskrat, familiar to every farm boy, has been one of the chief factors in maintaining a high total value for our annual fur production and, in commercial importance, it now heads the list of fur bearers of the United States. Beavers, otter, and martens have disappeared from their former range, and minks, raccoons, and skunks are rapidly diminishing.

The famous castle of the Alhambra in Spain was originally a fortress, so huge that it was capable of holding 40,000 men. It was begun in 1248 and completed in 1314.

Debits Against the World's Biggest Creditor

Taking a Peep Into Uncle Sam's Big Ledger; Is Owed Billions, But Owes More Billions

By HUSTON THOMPSON
CHAIRMAN, FEDERAL TRADE COMMISSION

Did You Know—

That of the money we pay, supposedly for the upkeep of the Government, 40 per cent goes for the upkeep of the public debt?

That though the world owes us ten billions of dollars, we ourselves owe thirty-two billions of dollars?

That the City of New York alone owes over one billion dollars?

That interest to the extent of $620,000,000 was paid on tax-exempt securities in 1922?

But—suppose the Government had collected twice as much taxes, would the burden on any average taxpayer be less?

Would the benefits of Government be greater?

FOREIGN nations today are in debt to the United States to the amount of some ten billion dollars. Ever since the World War it has been generally known that most of the world owed Uncle Sam money and that most of the money in the world was in the hands of this same Uncle Sam. Recent reports of the Federal Trade Commission on taxation and tax-exempt securities, however, bring out another side of this picture and indicate that in the process of "making the world safe for democracy" and fixing things up at home Uncle Sam and family have run up a sizeable personal debt of some thirty-two billion dollars.

In face of this undoubtedly startling aggregate of Federal, state and city debts it is a little hard to disport ourselves as jauntily as heretofore or to go about our business with the light-heartedness of the Jolly Miller who could sing, "I owe nobody, no not I, and nobody owes to me!"

For, although there are debtors at our front door who owe us some ten billion dollars, *there are creditors at our back door with a bill for thirty-two billion.*

Higher Cost of Governing

THE debtors are not overly inclined to pay up either, and the creditors are getting the equivalent of very high interest from us in the form of tax-exemption on the income from the government bonds they hold.

Is it not high time that we hold a great assize upon ourselves, take a national inventory of our own debts and strike at some national balance which will dissolve the specter of continuing debt and increasing taxation?

Almost a century and a half ago the shibboleth of "No taxation without representation" aroused our ancestors to a pitch of fervent righteousness that drove them to war. Today there are many who have reversed that shibboleth and are crying, "No representation without taxation." Those who have invented this modern phrase assert that the national debt of thirty-two billion dollars, or one-tenth of our total wealth, has gone into "hiding" in the form of untaxable bonds, leaving the rest of our capital which is invested in industry to bear the burden of this "slacker" money. A great proportion of these bonds, they declare, are in the hands of a few who prefer to play a safe game with a sure interest, while the other fellow pays the taxes.

Without attempting to pass here upon the economic justice of tax-exempt securities, it is undoubtedly true that the Federal Trade Commission's figures reveal an advancing cost of governing ourselves, which moves citizens to ask the question:

Are the benefits derived from government commensurate with the burden?

The Aftermath of War

THESE figures indicate, also, a gigantic mortgage upon the Nation's present and future for that which has been spent in the immediate past. The advocates of a "pay-as-you-go" system point to this indebtedness as a shocking example of what may result from a "pay-in-future" policy. They further assert that the present system of taxation and tax-exempt bonds will and does produce idle dollars and idle citizens at the expense of busy dollars and busy citizens.

The principal count made against Uncle Sam and family by those who are accusing him of financial profligacy is that a great part of the almost unthinkable expenditures represented by this thirty-two billion dollar debt has gone into a business that was not a productive enterprise. Nearly twenty-two billion dollars of that sum was spent by the Federal Government for war purposes. The logical answer, though, is a plea of confession and avoidance. If this money did not go into productive enterprise, it at least went for the purpose of protecting a productive enterprise. No one today regrets that we won the war. Incidentally, too, although the expenditure of this money went far beyond the cold calculation of commerce, one of the greatest reasons for its expenditure was to protect our right to carry our commerce on the high seas. It not only did this but it helped other nations to protect their right to carry on commerce with us.

How Debts Increase

THE charge of public extravagance has more weight when it is applied to our state and municipal expenditures, which have now resulted in a total debt of about eight and one-half billion dollars. Yet a large proportion of this sum has been spent for such items as road building, reclamation projects, harbor building, and other improvements, all of which add to the profit of the present and future. Moreover, during such periods as the year 1921, when business was stagnant and extremely subnormal, these public improvements kept millions of men at work who would otherwise have been idle.

The road building alone which was made possible by the expenditure of this money has prepared new avenues of transportation and mended and improved old ones. When market places have again become active through the restoration of competition and the resultant lowering of prices and greater buying, these new or improved highways will greatly facilitate transportation and distribution. Investment in road building and in work of like character, in improvement of public health and in education—these add to the material and spiritual wealth of the nation and may be justified on this score against even the most meticulous of critics.

It is necessary, however, to draw *a distinction between the uses* to which the money represented by the present tax-exempt public debt issues has been put *and the method by which this money was acquired* or is still being acquired. Granted that most of it was well or necessarily spent, it is still an open question *whether it could not have been raised without the staggering mortgage upon the Nation's future which public indebtedness represents today.*

The Commission's report shows that from 1912 to 1922 the aggregate net debt of the Federal, state, and local governments increased more than sixfold. The Federal debt (including the war debt) increased from about one billion dollars to more than twenty-two billion, while the debt of state and local governments increased from less than four billion to nearly ten billion. The bonded debts of cities are estimated to have increased 32 per cent in the period from 1917 to 1922. The City of New York, for example, has today a public debt of more than $1,000,000,000, or about $188 per capita, and there are no indications that this debt will be decreased in the future.

But these expenditures, it will be said, represent not only *pro*-vision but also *pre*-vision. They are made for tomorrow's needs as well as for those of today. The objects for which the debts were contracted will, it is true, be of benefit to future generations as well as to the present generation which contracted them. But if future generations, on the same theory, themselves contract correspondingly larger debts, there is no end in sight but eventual bankruptcy. *Not the debt itself so much as the rate of increase in it is the policy to be condemned.* It is a policy which contradicts the very precepts and principles of thrift, solvency, and cash payment.

Enormous Sums in Interest

WHEN is a debtor not a debtor? When the debtor is a Federal, state or local government! It is a paradox of public finance that when a government borrows money from its citizens through bond issues its method of repaying the debt is to secure more money from its citizens in the shape of increased taxes. As a corollary to, and, in large measure resulting from, the increases in public indebtedness in the past ten years, the Commission's report shows an increase of 127 per cent in the aggregate tax burden for national, state and local purposes from about three and one-half billion in 1917 to more than seven and three-fourths billion in 1922.

Those who believe in decentralization and local administration of government will be interested in the fact that only one-eighth of the total tax burden in 1917 and one-ninth in 1922 was for state purposes. Nearly three-fifths of all taxes collected in 1917 and slightly more than two-fifths in 1922 were for local purposes.

Federal taxes, which were about one billion dollars in 1917, or less than one-third of the whole burden, were over $3,600,000,000 in 1922, or three and one-half times as great, constituting nearly one-half the total tax burden of the country.

Who Are the Tax-Dodgers?

A PUBLIC debt is like a seven-passenger touring car. It must not only be paid for but its upkeep, in the form of interest and sinking funds, must be maintained out of current income. The increases in taxation described above and the heavy burden which they impose upon the industry and prosperity of the nation *represent only in part the requirements for the necessary current costs of government. In almost equal part they represent the cost of the upkeep of the public debt.* Of the total income from taxation in 1923, as the Commission's report indicates, $1,458,000,000 was spent for interest and retirement charges on the public debt. This means that nearly 40 per cent of the total ordinary governmental expenditures in that year were for the upkeep of the debt, as against a little more than 3 per cent in 1916. If the national income be roughly estimated at sixty billion dollars, the annual cost of the public debt alone in 1923 was nearly 2½ per cent of this income.

The sins of the rich are said to be many. They have been vociferously accused recently of putting all their money into tax-exempt government bonds, thus depriving industry of capital for investment and government of their just proportion of taxes. The report of the Federal Trade Commission shows, on the basis of estimates which I consider sound, that of the thirty-two billion dollars of tax-free securities, Federal, state and local, nearly twelve billion were in the hands of business corporations in 1922 and nearly five billion in the hands of individuals with taxable incomes of more than $10,000 a year. This means that nearly one-half the tax-exempt securities were in the possession of individuals with incomes of less than $10,000 a year.

Of the total of thirty-two billion of tax-exempt securities issued and outstanding on December 31, 1922, nearly twelve billion were wholly tax-free while more than twenty billion were free of the ordinary income tax but subject to the surtax on the larger incomes. Of the wholly tax-free obligations $2,294,000,000 was issued by the Federal Government and $8,797,000,000 by state and local governments.

The interest on tax-exempt securities received during 1922 by individuals whose taxable incomes exceeded $10,000 a year each is estimated at nearly $176,000,000, of which more than $97,000,000 was wholly tax-free and more than $78,000,000 was conditionally subject to surtax. All of the interest received from tax-exempt securities in 1922 by business corporations, estimated at $448,000,000, was wholly tax-free under the existing law. Banks and trust companies held nearly $5,600,000,000 of the securities and received $236,000,000 of the interest. Insurance companies owned more than $2,200,000,000 and received nearly $92,000,000 of the tax-free interest, but obtained practically no benefit from the exemption since they were, by law, already exempt.

One of the arguments least used against tax-exemption is the cost in lost taxes. The total maximum addition to Federal income tax returns in 1922 that would have gone into Uncle Sam's pocket, if securities then exempt had been taxed, would have been about $100,000,000. It is asserted that this loss to the Federal Government is offset, however, by the comparatively low rates of interest which it has to pay by reason of the exemption of these securities from taxation.

"Pay-as-you-go" Principle

SO MUCH has been said for and against the issue of tax-exempt securities that the public, approaching the exhausted stage, probably desires it to be consigned to limbo. Nevertheless, the data shown by the Federal Trade Commission in its report is so vital that it necessarily compels discussion. Aside from the Federal debt the greatest significance of the report lies in the story of enormous and growing municipal and county debts. For the combined state debts of only a little more than a billion there need be no great criticism. But for the staggering total of some nine billions of dollars of county and municipal debts what ample justification is there? It is prodigality run mad, and if, as is claimed, it comes of the comparative ease with which these minor divisions may borrow money through issue of their tax-exempt securities, a powerful argument indeed has been found against such exemption.

It all comes back to the "pay-as-you-go" principle. There may be emergencies or extraordinary benefits which justify governments in mortgaging the future with expansive bond issues. But these should be the rare exception and not the rule. It is so easy to spend and sometimes to spend foolishly and intemperately, when payment is to be made at some other time or by some other person. The safeguard of the taxpayer against public extravagance depends upon whether he insists upon shouldering each ordinary public expense as it is incurred or whether he will permit himself to be drugged with a public bond issue which postpones the pain but aggravates it eventually or visits it upon the children of the third and fourth generation.

The Petrified Forest Giants of California

How a Woman Went Into the Wilds and Unearthed a World Wonder

By ALLAN L. BENSON

WHICH is the more remarkable, a petrified forest or an amazing, resourceful woman who went into mountain wilds, made her home there among wild cats and dug up the forest?

We will begin with the lady, anyway, because if it had not been for her there would be nothing to write about. Her name is Ollie Bockee. Like Lillian Russell, she was born in Clinton, Iowa. Like Lillian Russell, too, she got out of the town. She was living in Omaha when the great quake rocked San Francisco 18 years ago. That quake fascinated her. She wondered what a town looked like that had been shaken to pieces and burned to a crisp. Two years passed before she was able to make the grade to the coast. San Francisco, in the meantime, had built up a good deal. She moved on. She had come to see something wild. San Francisco no longer looked wild. What was the next best bet? She did not know. She began to cruise about in a car.

One day she found herself in historic country. She was in the mountains. A little to the north was Mount St. Helena, where Robert Louis Stevenson wrote "The Silverado Squatters." A little to the south was "The Valley of the Moon," in which Jack London lived and loved and died and took a drink or two besides. What she wanted was land, and that was all around her. Land and trees, mountains, sunshine and sky—nothing else. No homes. No people except those who rode in the daily stage from Calistoga to Santa Rosa. Oh, there were houses some miles away, but not where she happened to stop her car.

Ollie Bockee stopped her car in front of a petrified forest, but did not know it. She had been fascinated by the combination of green mountain sides, sky lines and sunshine, an abandoned vineyard and an old shack. She got out and looked around. The place improved upon acquaintance. Not forty women in the United States would have made their home there on a bet, but it just suited Ollie Bockee. It was beautiful and it was wild!

Ollie Bockee backed her car to a place where she could turn around in the narrow road and started back to Calistoga in search of a realtor. She wanted to know the facts, particulars, qualifications and strong points of the place she had seen, including the price. She found a realtor but he did not know much more about the place than she did. He knew who owned it and he thought it comprised three or four or five hundred acres (acres don't mean anything in that wild country) but he wasn't sure. He also thought the price was $1,500, but Ollie was soon to learn that he was a very inaccurate thinker.

The price was $16,000, as she learned when she found the owner. Why? "Lady alive"—the owner went on—"don't you know there are petrified trees on that land?" She almost jumped out of her silk stockings. Lead her to them, she told the gentleman.

Ah, but that was a different matter. The trees were under fifteen or twenty feet of earth. A foot or two of the tops of a few stuck out, but that was all.

These tops got Ollie. Where there were tops she knew there must be bottoms, middles, sides and everything else. A big electric sign flared up in her brain: "OLLIE BOCKEE, OWNER OF THE ONLY PETRIFIED FOREST IN CALIFORNIA."

She closed with the gentleman at his own price and paid him $4,000 down. In a week, she was settled in the shack.

Oh, the years that followed! Hard years, bitter years, struggling years—happy years. Her only chance of making a living, paying the interest on her $12,000 mortgage and the principal as it became due lay in unearthing a petrified forest for people to see. What was above ground when she bought the place amounted to little. Not many persons would pay 50 cents to see a few chunks of rock that looked like wood.

So Ollie went to work with her own mitts, as the ladies who serve Persian melons in San Francisco restaurants say. Having little money, it was the only thing to do. She dropped her needle and thread to take up a shovel and a pickax. It was not exactly the kind of work to which she had been accustomed, but the shovel and the pickax did not know it.

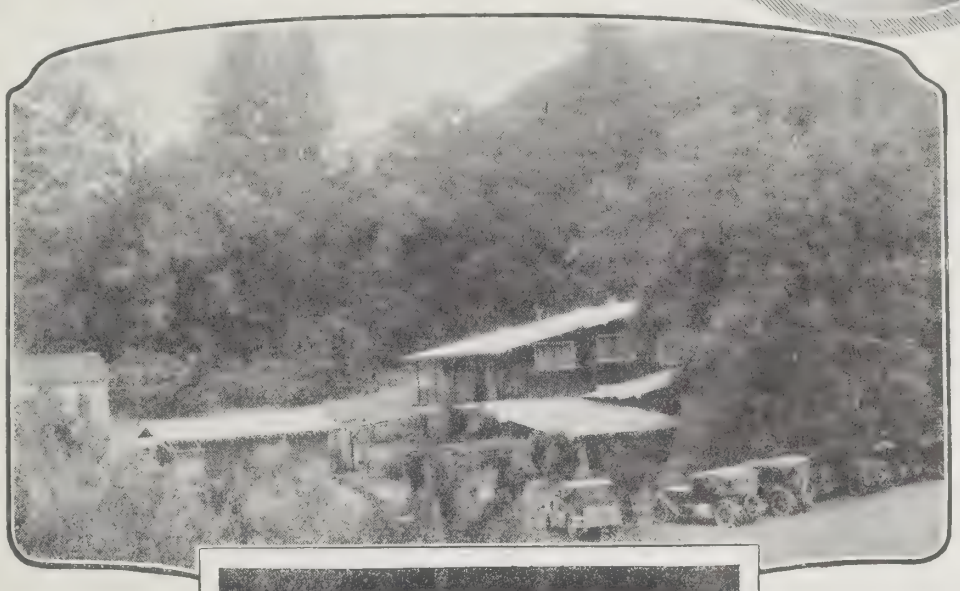
And at the end of her labors what she named the "Queen of the Forest" lay before her. A petrified tree 80 feet long and 12 feet in diameter! A giant redwood that had gone down in a fury of flame, fire and ashes perhaps three million years ago. Gone down in its youth, one might say, because a redwood tree 12 feet in diameter is only about 3,000 years old and, therefore, not tall enough to look over the heads of its grandparents and flirt with the fleecy clouds that hang motionless over the horizon.

That tree brought Ollie good luck and bad luck. A man who had read about it came to see it. He threw down a $5 bill. Ollie hadn't a cent of change and the California law provides that if the keeper of an amusement place cannot make change he must admit the prospective spectator for nothing. The gentleman, therefore, came in, one might say, as free as the air. Ollie hasn't been out of change since.

Things braced up a bit after that. More persons took the stage from Santa Rosa or Calistoga to go over to the petrified forest. Ollie Bockee, therefore, proceeded to prepare a budget. Half of the proceeds should be devoted to food and raiment; half to excavation.

That made more dirt fly. As more trees came out of the ground, more visitors came to see them. The treasury did not become fat but it swelled quite a bit. Ollie built a house and installed an oil-burning engine to make electricity with which to light the place. Somebody told her she should have bits of the petrified wood polished up and made into souvenir rings and pins. She thought this was a good idea, ordered six rings made, forgot what they cost her and sold them for less than she paid for them. Ollie has learned a lot about business since then and now has a large souvenir room that always souves at a profit.

After she built her house and thereby showed signs of prosperity, highwaymen that strolled through the mountains began to take notice of her. The first one merely entered the place at night and grabbed off $600 worth of diamonds that she had brought from Iowa. The next one was not so moderate. He took all he could conveniently pick up and then stole her automobile in



Circle—OLLIE BOCKEE. Above—Entrance to the California petrified forest, Ollie Bockee's home. Below—The "Queen of the Forest," petrified tree eighty feet long, twelve feet in diameter.

which to carry away the loot. Ollie complained to the sheriff and he is still investigating, but unless the crook got out of gas he is probably far away.

Such is the life Ollie Bockee has led and is still leading. Alone in the mountains, in the beginning, with wild cats prancing around the front porch at night. No telephone then—or now. Highwaymen braving the wild cats to get in and steal. Not a neighboring house in sight or within miles. But two or three women and a young man who is related to her are now in the house at night.

But Ollie Bockee likes the life and, now that she doesn't have to dig, has studied geology until she talked a California legislative committee off its feet last winter. The California legislature wants to buy the petrified forest. Ollie is willing to sell but wants to make a killing. The legislature, also, wants to make a killing. Both Ollie and the legislature are still alive. Nothing doing. Cannot agree on a price.

Now this is the story of the great petrified trees that one sees sprawling about in this forest, as Luther Burbank told it to me: A very long time ago—hundreds of thousands and perhaps millions of years ago—a tremendous earthquake shook the country where Ollie Bockee now lives. The earthquake was so violent that it hurled down the giant redwoods. Think what a shake it must have been to hurl down trees twelve feet in diameter! The surface of the earth must have twitched in something the manner that a dog twitches its skin to scare off a fly, because all of the trees were thrown to the south. Not one points east or west.

After the earth shook, Mount St. Helena burst into eruption. Fire, ashes, molten lava—everything that the old volcano had—came out and coursed down the valley in which now lies the petrified forest. The ashes covered the fallen redwoods many feet deep. Wherever the end of a tree was not covered, it was burned by the lava. To this day, one can see the charred wood, now turned to black stone.

Then the volcano became quiet and the rains began—the heavy California rains that start in the autumn and, with short intervals of fair weather, last until spring. The rain rotted the buried redwoods. As the redwoods rotted, the rains washed down silica to take the place of the wood. The silica, having been cast as it were in the pattern of a tree, came to look like a tree. There is your petrified forest; silica poured into great casting molds in which trees had been used as patterns.

Nowhere in America is there another such petrified forest as this. The petrified wood of Arizona is more beautifully colored, owing to the copper deposits, but there are no trees in the Arizona forest—only small broken parts of trees. In the Sonoma County forest that Ollie Bockee has brought to the surface one sees entire giant redwoods as they fell when the earth shook and Mount St. Helena entombed them. A tree that is known as "The Monarch" is 126 feet long.

One would think these trees were of wood instead of stone. Every part of the texture and fiber has been perfectly reproduced. Wherever a worm bored into the bark, millions of years ago, a hole appears in the stone.

The forest was discovered in 1871 by Charles Evans who is now known to fame as "Petrified Charley." He had no luck with the place and sold it to a preacher and a lawyer. They got into a row because the preacher was a prohibitionist and did not want to make into wine the grapes that grew in the vineyard. The place changed hands several times after that, but nobody ever did anything with it until Ollie Bockee stopped her car in front of it.

A queer sort of people visit the forest. They are the same sort of people one sees everywhere else. Most persons become queer when they get to a place like this. The younger ones become seized with a desire to pass on their names to posterity and leave their signatures, scrawled in pencil, on the rocks. With the list of names that soon accumulated Ollie could have started a mail order house, but instead she had a man take a brush and a pot of paint and paint them out. It did no good. More names came on like magic. More paint. More names.

Then she hit upon what she thought was a brilliant idea. She built a little house, called it the "Autograph Gallery," left the door open and even provided pins with which cards might be fastened to the wall. In a few months, the house was so full of cards that she had to take them all down to make room for more. But visitors still write their names on the rocks.

Another habit of which visitors apparently cannot cure themselves is stealing. Bits of petrified wood are the chief attraction, but they take even the bark off the trees. As they enter the grounds a sign asks them not to take petrified wood from the forest and informs them that free samples will be given to them at the office. On some of the petrified trees are signs threatening souvenir hunters with arrest. All of these signs might as well have been written in Chinese. Nobody pays any attention to them.

The country around the petrified forest is wonderfully interesting historically, geologically, and from the point of view of sheer beauty. Within an hour one can get to Stevenson's old place on the side of Mount St.

(Concluded on page 4)

Why the "Road" Has Ceased to Exist

Theatrical Swindles Wore Out the Patience of Country Patrons; Refused to Tolerate Degenerate Plays and Scenic Hodgepodge

By PETER SCHUYLER

THE American theater is at present submerged in a depression which is steadily growing worse and is causing great concern to those who depend upon it for a living. The list of plays which have opened—and closed almost immediately since this season started—is so large that it has caused violent contraction of the pocketbooks of producing managers. The long-plundered public has remained apathetic to the disasters which have overtaken the producers but hungry playwrights, thousands of unemployed actors and actresses, and wailing "angels" from Wall Street and vicinity are commencing to be interested in the cause of conditions. All realize that if something does not check the increasing arteriosclerosis in the body theatrical there will be nothing left to do about the case except give the corpse a decent burial. Attempts have been made by experts in the treatment of sick business to find out what ails the theater. One diagnostician announces that the depression is a natural phase of the industry and will pass in time. Another descants on the need of a tonic in the form of large doses of American dollars. Others assign reasons which are as diverse—and quite as foolish—as the ones already given. The real reasons are neither hard to find nor difficult to state, and they lead from one to the other. The best means of analysis is to be found in a consideration of the big baseball leagues.

Baseball and the Theater

THE National and American League baseball enterprises are as viciously commercial as the native theater, yet they prosper. The expressions of baseball magnates who prate publicly of the all-essential detail of "sport" in their business are just as rank as those of producing managers who burble about "art." Baseball barons and theatrical magnates plunder the paying public on any, all, and every occasion. But the baseball gentry do make an effort to keep their graft going at top speed by the constant infusion of young blood and fresh talent.

They have an elaborate and costly system for discovering where the blood is to be located and how the talent can be secured for their customers' entertainment. The producing managers of baseball would go out of business in short order if there were not what is described by sports writers as "the tall grass," "the bushes," and "the sticks." All these are synonyms for the minor leagues which are spread all over the country and which serve as training grounds for the recruits for the National and American leagues. Through "the tall grass" and "the sticks" there stalks a horde of highly paid representatives of the big leagues relentlessly searching for young players who can play baseball so well that they will prove to be drawing cards at the turnstiles of the parks in the big cities. The rivalry among these "scouts" or "ivory hunters" is as keen as that between the clubs they represent, and it is safe to say that no actual or potential prospect can remain undiscovered and unsigned for any length of time. When a "find" is located he is looked over not by one but by many experts before he is finally bought or drafted for appearance on the baseball stage. Not so with the theater.

No Theatrical Bush Leagues

NO ATTEMPT is made by producing managers to find actors and actresses whose talents will warrant their removal from the constricted field of the provinces to the theaters of Manhattan which is the theatrical center of the country. What the minor leagues are to baseball the "Road" is to the theater. And there is no longer a "road" in existence. Outside of less than six cities in the United States the theater—as distinguished from the motion picture places—is either dead or in the last stages of dissolution. The "Road" which in times past was a field where thousands of players found employment and experience, the lovers of the play secured entertainment, and producers made money, has disappeared forever. If it were not for sporadic appearances of companies breaking the trip from Manhattan to the West or from Chicago to the East vast sections of the United States would scarcely know there was any other form of dramatic entertainment except the "movies." The destruction of the training ground for the actor has had the inevitable result of a consequent and noticeable declination in good acting even in the productions which are made in the surviving four or five theatrical centers of the land. It is true that the managerial mania for types instead of finished actors who can assume the characters drawn by the playwright is partly responsible for the disappearance of the art of acting in America. There was a period in the history of the theater when the ability to "play the part" was the all-important consideration to be met by the actor and insisted upon by the producer. Now the one requisite to be furnished by the actor and demanded by the producer is the ability to "look the part." The vicious circle of the stage world, which means the same group of managers hiring only the same group of players season after season, has also been a cause of loss of patronage. But the outstanding reason for the decay of the theater is the cynical scorn which the producing managers have for any actor or actress who has not a metropolitan reputation. No matter how evident the talent and how great the promise shown by the player in "the sticks" it is powerless to attract the notice of the big league magnates of the theater world. They have, it is true, a corps of "scouts" and "ivory hunters" but their operations are confined to "digging up live ones" in Wall Street to finance a play into which the producer would not put a nickel of his own. That is why actors of real ability and genuine talent seldom reach The Great Shine Way. To their credit it must be said that they try. But they cannot withstand weeks and years of waiting discouragement and contempt which is their inevitable portion whenever they try to enter the broader field for their artistic gifts. Scattered throughout the stock companies of "the tall grass," there are the wrecks of fine careers caused by the indifference or the contemptuous neglect of the men who control the playhouse.

Why the "Road" Has Disappeared

IF YOU ask the producer of stage pieces why the "Road" has disappeared his instant and profane answer will be "Motion pictures." He is right but does not know in the way he means. Manhattan has a contempt for everything and everyone that is not confined within the boundaries of Manhattan. The Manhattanese looks upon all other residents of the United States as "rubes" or "hicks." The Manhattan theatrical producer has another designation for those who are not within commuting distance of The Great Shine Way playhouses. He knows such contemptibles only by the all-embracing term of "suckers." To him they were not patrons who should receive fair and honest treatment. They were merely the possessors of so much money which it is his right to take away from them by hook or crook. And by crook is the preferred method. Long ago he realized that the fact a play had been shown successfully in Manhattan gave it prestige and drawing power in the eyes of the country outside and began to trade on that realization. At a period, now so remote that it is impossible to be fixed, when he sent out a Manhattan success he saw to it that the sentence "Original New York cast and production" was literally true. That is the way in which "suckers" are raised.

Professional gamblers know that the surest way to get all a victim's money is to let him win a little when he begins to play and Manhattan producers belong to the gambler species. So it happened that for a short time the "original New York cast and production" was really sent on tour. But the temptation to get "the sucker's" money was too great to be long resisted and the trap was baited accordingly. Let us say that in 1920 a play was staged with great success in Manhattan. The news was so industriously circulated by press agents that the uttermost parts of the country became aware of the all-important item that at the 18th Street Theater, in New York, "Why People Get Married" was the greatest domestic comedy the world had ever seen. From Sitka to Matamoras the glad tidings spread. At the expiration of its 1920 Manhattan run "Why People Get Married" was sent on the "Road" with the original New York cast and production. The "Road," impressed by the New York run, flocked to see "Why People Get Married" and found it all that had been represented. At the expiration of the 1921 tour of the provinces, "Why People Get Married" once more fared forth into the wilds labeled "The original New York cast and production." The "Road," having seen the play on its former appearance at the local opera house, flocked to renew its pleasure. The prices of admission were the same but that was all. The actors appearing in the play were the poorest obtainable and the "original New York production" proved to be some dirty, dilapidated, scenic hodgepodge made up from the refuse heap of the producers' storehouse. The "Road" was angry at the deception practiced upon it but the owner of "Why People Get Married" had cleaned up a handsome profit by the tour of the cheat. What the "Road" thought did not concern him. The "sucker" almost always forgets and comes back for more. The next year the same producer with a show of another name perpetrated the same swindle and profited handsomely by it. There was apparently no limit to what the "Road" would stand.

The "Road" Rebels

YEAR after year, producer after producer systematically plundered the country. Always the infallible come-on, the "original New York cast and production," was used. Suddenly there came a change. The "Road," in the language of the manager, "went bad." The goose which had laid the golden eggs stopped work. Instead it took to making decadent hen fruit with which the "Road" pelted out of town the "original New York cast and production." The "sucker" had evolved into "a wise guy" and the good old days of profitable swindling passed away for all time. But the producing manager never thought to blame himself for what happened. Forced into giving an alibi he picked out the "movies." If you listened to him long enough you learned that the artistic sense of the country had become so blunted that it could no longer appreciate the value of the spoken drama given by the "original New York company" and with the "original New York production." If something was not done immediately it would be only a question of time when the film would replace the stage, he said. But it never occurred to him to do something himself by trying to win back the faith of the people whose money he had obtained under false pretenses. The professional swindler had one rule of conduct: "Never give a sucker an even break" and the producing manager would rather let the "Road" die than violate the code of his class.

The reason the movies drew the attendance of the former patron of traveling shows was not as the perpetrator of the "original New York cast and production" bunko game asserted because the "Road" has grown cheap and unappreciative. It has not. The enormous sums it spends annually for reputable concert artists and for the occasional first-class theatrical attraction it can see proves that it is willing to pay its money for something really worth while. But it is unwilling to present its dollars to Manhattan highbinders and have its intelligence insulted into the bargain. If it must be cheated it prefers to have the process cost as little as possible. There has been beaten into the "Road" the mathematical difference between paying $2.50 for a tawdry "original New York cast and production" fake and a 50-cent motion picture horror. In addition to saving money it is conserving its energies. It goes to a theatrical presentation expecting something, does not get it and becomes angry. It attends the local movie palace expecting trash, gets just what it expected and cherishes no resentment. The "Road" has not grown penurious. It has awakened even if the Manhattan producing managers have not.

The "Road" Will Not Tolerate Dirt

FINALLY balked in his cheating of the natives of the hinterland of Manhattan with bad acting and worse productions the bandits of the dramatic and musical comedy theater have tried to recoup their losses—and possibly revive the dead goose—by passing on to the "Road" the nastinesses which made money for them in Manhattan. The filth that is such an attraction on The Great Shine Way has been tried on the outlanders. But just as they failed properly to estimate the limit to the gullibility of the "Road" in the matter of fifth-rate productions at first-rate prices so have the men who operate the theatrical business guessed wrong on the point of what the "Road" will stand. To their amazement they have learned that the great body of amusement seekers—outside Manhattan—will not tolerate, much less patronize, dirty dramatic and musical New York successes. In this one particular, at least, the country at large will not be ruled by the taste and standards of "the greatest city in the world." It may look to Manhattan for its styles in coats and suits. But it manifests a strange independence when it comes to what is clean and what is unclean. It will even bear with unblushing equanimity the derisive characterizations of its mentality hurled from the Battery, the Bronx, and Brooklyn.

Nor will it accept as true examples of American brilliancy the flip "native comedies" which Manhattan audiences find so attractive. It stubbornly prefers humor to Tenderloin freshness, and genuine wit to "wise cracks." In other words, the "Road" insists on remaining clean, homely, intelligent, and American, the jeers and the disgust of theatrical swindlers notwithstanding.

The Petrified Forest of California

Concluded from page 3

Helena, and I was told that the house is still standing. An hour's drive to the south takes one through the "Valley of the Moon," to the late home of Jack London on the hills of Glen Ellen. London chose for his residence a very wild and picturesque locality, but it is not so beautiful, it seems to me, as Rincon Valley, which one skirts in driving from the petrified forest to Glen Ellen.

The first time I saw Rincon Valley I nearly lost my breath. We were driving up in the mountains, turned a sharp corner and there it was! A thousand feet or more below, the valley lay in blissful silence, walled in by a semicircular range of distant mountains. Like squares upon a checkerboard were the various fields of grass and grain, made small by the distance from which they were observed. Here and there were orchards of figs, plums, and oranges growing beside great vineyards. An occasional house completed the picture. And it was more like a picture than anything else. Viewed from this mountain height, everything below seemed so quiet, so perfect, so utterly charming. There is nothing like a little distance to iron out the rough spots in a landscape or a human being.

In Calistoga, which is five miles from the petrified forest, geysers hurl water into the air at various intervals, ranging from a minute and a half to half an hour. The water is boiling. Several acres of land in their vicinity is so hot that nothing will grow upon it. The whole strip of land from Calistoga, through the petrified forest to the California steam wells and Mount St. Helena is tricky. One shot of dynamite set off by a roadbuilding gang destroyed all of the springs that supplied Ollie Bockee's place with water. The springs were not near together but they were apparently all connected with one single subterranean water source which the blast of dynamite drained.

In other words, the fires that millions of years ago, blew off the head of Mount St. Helena and were the means of petrifying a forest are not out yet. They are still heating the water that boils in many springs near the trees that have turned to stone.

Traveling at Speed of 294,375 Miles a Second

Scientist Believes Etherons Provide Pathway for Light and Radio Waves

By CAPT. T. J. J. SEE, U. S. N.
Director of the Naval Observatory at Mare Island

Everything which has motion, as we humans conceive of motion, has a medium in which to move. Sound travels on waves of air, but how do light, radio, magnetism, and the forces of gravity travel at speeds so vastly greater than sound? Through what medium does the attraction of gravity pass from the sun to the earth, from the earth to the moon, or between the other stars and planets in sidereal space?

Captain T. J. J. See, U.S.N., director of the Naval Observatory at Mare Island, California, one of the first scientists to upset the Einstein Theory of Relativity, believes he has discovered the medium, the superfine gas which fills all space, and through which light, radio waves, and gravitational forces travel. Here is his own story of his discovery and what it means, told for the first time outside of scientific documents.

A MEDIUM known as the ether, superfine and associated with the stars and with the light of day—as in the gleaming brightness of the sky over Mount Olympus—has been recognized quite universally since the time of Homer. During the past three centuries the greatest geometers and natural philosophers, from Huyghens, Newton, and Euler to Maxwell, Kelvin, and Poincaré, have admitted that this ether is the only known medium for the action of physical forces across the tremendous distances of space.

Interstellar space—that is to say, the space outside of and beyond the comparatively thin shell of air which surrounds and moves with the earth—I have found to be filled with this medium, a gas so rarefied that its *etherons,* or corpuscles, move with a velocity of 294,375 miles a second, as compared with the 186,000 miles a second which light moves, or 1.57 times the velocity of light, and 23.5 times faster than the *electron* moves. The etheron, too, is the smallest of all existing things, its radius being only about 1/3600 that of a molecule of hydrogen.

It is in this medium, through this medium, or by this medium that light travels from star to star, as from the sun to the earth, and, more important than this, the ether is the medium by which the planets are held to their suns, and the suns themselves in their places, through the action of the force of gravity, the power of gravitation, whose medium of travel and operation is the ether. It was established by Huyghens in 1673 and confirmed later by Newton, that without a medium capable of exerting tremendous stress across the celestial spaces, the planets could not be made to curve their paths at all points of their orbits about the sun. But, the planets and the double stars do actually describe curved paths. We know, therefore, that these celestial bodies are acted upon by tremendous central forces. My new theory of the ether, which I am here outlining, explains these forces, and illustrates the process for generating tensions pulling in straight lines between the bodies—in other words, the power which holds the earth in its orbit around the sun, and the moon in its path around the earth.

Challenges Einstein Theory

THIS new theory of the ether challenges the Theory of Relativity, as advanced by Einstein, to its very foundations. In fact, the whole doctrine of relativity is worthless and misleading, because science had not yet developed for the ether a valid kinetic theory, as it has in the cases of the other known gases. This lack of such a kinetic theory led to the vague suggestion, in some quarters, of doing away with the ether, thus completely ignoring the law of centrifugal force established by Huyghens and confirmed by Newton.

Without a medium through which the power of gravitation could act, how could the sun pull the earth to curve its path into an ellipse about a focus in the center of the sun? How could the earth hold the moon in her orbit? Action equivalent to the breaking strength of many millions of immense cables of the strongest steel *cannot be conveyed across a void,* without a medium of transportation counteracting centrifugal force by central attraction, thereby governing the motions of the planets. It was held by Newton that the power of gravitation arises from the impulses of a subtle ethereal medium that is diffused over the universe, penetrating all things, passing through stars and planets and suns and worlds with virtually the same freedom and speed with which it moves from star to star in interstellar space. Newton says, in a letter to Mr. Boyle, February 28, 1679:

"And, first, I suppose that there is diffused through all places an etherial substance capable of contraction or dilatation, strongly elastic; and, in a word, much like air in all respects, but far more elastic.

"I suppose that this ether pervades all gross bodies, but yet so as to stand rarer in their pores than in free spaces."

True Cause of Gravitation

WHAT Newton calls "impulses," we now call "waves." In accordance with this idea, I have developed the kinetic theory of ether, two centuries after it was first outlined by Newton, the discoverer of the theory of gravitation. This new theory leads to the wave-theory of gravitation, and its confirmation by several independent processes of experiment, observation and calculation, so that at last *the true cause of gravitation appears to be clearly established.* In Newton's time, however, the kinetic theory of gases was not yet developed. It was begun slightly by Daniel Bernouilli in 1738, and completed by Joule, Watterston, Clausius, Maxwell, Boltzmann and others in the past 75 years. In this kinetic theory of gases, a gas is made up of corpuscles constantly flying in every direction, with high velocity and great rapidity of collision. Mathematical formulas have been worked out—chiefly by Maxwell and Boltzmann—for calculating the mean free path between collisions of these minute particles. The theory has been tested by a variety of ingenious experiments to show that it conforms to the realities of nature:

1. For example, the pressure which a gas exerts on a containing vessel is due to the summation of the product of each molecule by the mean of the square of the velocity of translation between collisions.

2. Experiments by Lockschmidt, O. E. Meyer, and others, about 1868, on the diffusion of gases through orifices in delicate tubes, have enabled investigators to fix the velocity of the mean motion of the molecules. There is, therefore, an *observed velocity,* denoted by a Greek character, which has led to the tabulation of the velocities of these gases as a result of half a century of research by many eminent experimenters and mathematicians.

From these two facts, we learn that hydrogen has a mean molecular velocity of 185,900 centimeters a second, or roughly, 6,200 feet. We learn, too, that the mean free path of the hydrogen molecule—that is, the distance along which it can move—is only .0000116 centimeters, or, again roughly, .0000039 of an inch. More than this, we learn that the number of collisions among the hydrogen molecules is 14,743,000,000 a second, while radius of each molecule is 1.00000034 of a centimeter. For those who wish to carry these calculations further, it may be said that a centimeter is 0.3937 inches. Other gases are similarly known.

The greatest impression gathered from this accumulated knowledge is the enormous number of collisions in all the gases, the vast number of rebounds a second, and the short space between the average collisions. In this respect, the table so evolved is almost beyond human comprehension. But, bearing in mind the figures just given for hydrogen, which is the best known of the world's elementary gases, let us look for a moment at the figures obtained for ether. We find that the mean velocity of the molecule of ether is 47,123,900,000 centimeters a second, as compared with 185,900 for hydrogen, the next most active gas molecularly speaking. The mean free path of the molecule of ether is 57,295,900,000 centimeters, as compared with 1/100000 centimeter for hydrogen, and a trifle more for helium. Yet the collisions of the molecules of the ether are only 0.82 a second, as compared with 14,743,000 for hydrogen a second. We further find that the radius of the ether molecule is 1/3620 that of the hydrogen molecule.

The Finest of All Gas

THESE things will become somewhat easier to grasp, and the theory of the ether will become more comprehensible if we recall a law discovered by Maxwell some 60 years ago, that, under similar conditions, the kinetic energies of the molecules of any two gases, whatever their relative masses, are equal. Thus, if an oxygen molecule have sixteen times the mass of a hydrogen molecule, the mean velocity of the oxygen molecule will be only one-fourth as great as that of the hydrogen molecule. Accordingly, the point to which we are aiming is that the fine and very light gases have very high molecular velocities, while the sluggishly moving molecules of heavy gases, such as oxygen, carbon monoxide, carbon dioxide, and chlorine, have relatively small velocities, because their large mass, with small velocity, gives these molecules equal kinetic energy to that of hydrogen, which has the lightest and most rapidly moving molecule among the terrestrial gases.

With these facts before us, we need not be surprised at the tremendous molecular velocity calculated for the etheron, or particle of ether. The ether is the finest of all gas, *the medium which underlies the universe!* The mean velocity of the etheron—the minute particle of this gas which fills all sidereal space—is 471,239 kilometers, or 294,375 miles a second, while that of the hydrogen molecule is 1.859 kilometers, or about 1.16 miles, and that of the oxygen molecule 0.46 kilometers, or approximately 29/100 mile a second. The length of the mean free path of the etheron is *5,730 million million* times greater than that of the hydrogen molecule. This contrast is enormous, almost infinite; it is like comparing a distance 46 per cent greater than the moon's distance from the earth with 1/100000 centimeter, and a centimeter is only a little more than one-third of an inch. One of these distances is great beyond comprehension, the other almost too small for ordinary appreciation.

From these facts we learn that the etherons fly about in every direction, with a mean velocity of 471,000 kilometers a second, and that the mean free path is so long that only 82/100 of a collision occurs every second. Accordingly, the ether is infinitely freer, easier, and less bound than any terrestrial gas in all its motions. *It is perfectly adapted to penetrating into the densest matter, and enters it almost without resistance.* Thus, it is not surprising to learn that it penetrates to the very centers of the sun and the planets, almost as if these dense masses were of the merest gossamer structure.

Waves in the ether, however, *do not escape very sensible resistance as they move through the earth, the sun, and the planets.* In fact, many remarkable results are deducible from study of the waves in radio. It is possible to show that near the earth radio waves travel more slowly than light waves—at the rate of only about 165,000 miles a second, as compared with 186,000 miles a second, the known speed of light. The ether enters into no known combinations, but underlies the whole physical universe, and is a monatomic gas.

Now, we have shown that etherons move with 1.57 times the speed of light. Until my discovery of this new kinetic theory of the ether, scientists could not explain the very rapid propagation of light, with a velocity of 186,000 miles a second, which velocity has been known since Roemer discovered it in 1675. The electron, with a mass 1/1700 that of the hydrogen molecule, would have a mean velocity of only 1/3000 that of light, or about 99 kilometers a second. Hence, the velocity of light could not be explained by the electron theory. In fact, the electron theory has been greatly overrated, and of late years has begun to break down. It cannot possibly serve as a basis for a physical theory of the universe. The ether alone offers the possibility of a really valid theory, because this gas is the finest of all media, with etherons weighing only 13/1000000 of a millionth of a hydrogen molecule. Thus, the etheron scarcely is more than 1/50000000 of the electron in mass. It is no wonder that the electron can travel only with the mean velocity of 99 kilometers a second, or 1/3000 of the velocity of light, while the etheron, with a mass nearly fifty million times smaller, travels with a velocity 1.57 times that of light. Thus the fact becomes apparent that light, whose incredible velocity is so great as to carry a disturbance more than seven times around the earth in one second, travels in this medium.

Now as to the medium which enables the power of gravitation to bind the earth on its curved course around the sun:

Newton's Impressions Proved

IT IS remarkable that, as early as 1678, Newton regarded the ether as less dense within and near the heavenly bodies than in the wider surrounding regions of free space. In my researches, I have been able to verify Newton's intuition by the following processes:

1. By proving that electrodynamic action, magnetism, and gravitation, *are all wave phenomena,* and, therefore, the amplitude or width of agitation of the waves is less as we go outward in free space.

2. This makes it possible for the etherons to crowd closer together far away from a body than in close proximity to it. Thus, the density of the ether is less near a body and grows greater as we recede from that body. Near a body, the large wave amplitudes cause the medium to be so violently churned up that the density varies, and it is found to increase outwardly directly as the radius.

These proofs verify Newton's impressions of two centuries ago. To place the demonstrations on a secure foundation we had to show, first, that the amplitude of wave action expanding in free space varies inversely as the distance from the center, and hence, that the resulting density of the ether may increase outwardly directly as the radius; and, second, that waves corresponding to the known phenomena of magnetism and universal gravitation actually come to us from the sun. The observational proof of the existence of these long waves from the sun first became available to me in 1921. It since has been confirmed by several independent processes.

The shortest waves known to science are the ultra-violet or chemical rays; then come the light rays of the visible spectrum, and next the heat rays, which extend to the infra-red or beyond. Beyond all these, however, are the waves of magnetism and universal gravitation, which are the longest of all, and thus may go through the heavenly bodies without loss of much of their power. Light and heat waves are so short that they penetrate bodies only slightly, for when heat waves are conducted into a solid mass, they take a long time to penetrate inward, or outward, and hence the cooling of the earth and other heavenly bodies is a very slow secular process, involving for some effects millions, and even billions, of years.

The Earth's Magnetic Envelope

THE earth, however, is surrounded by a magnetic wave-field, which gives direction to the mariner's compass, and thus aids navigation, as was first learned by the Chinese, about 1100 B. C. When the compass was introduced into Europe, about A. D. 1185, it increased the power for guiding ships at sea, and was used by Columbus in 1492, and by Magellan, in the three-year voyage in which he made the first circumnavigation of the globe, 1519-1522. Now, if it were not for the new theory of the ether, we still should not understand why the magnetic needle points to the north. This invaluable discovery of the Chinese has been in use about thirty centuries—since the days of Homer!—yet it has been only recently made known that *the needle itself emits a field of parallel waves,* in conformity with those generated by magnetism in the earth. The wave-field of the needle, furthermore, agrees to and conforms with the wave-field of the earth. Thus, the needle lays itself quietly in the hollow of the wave-field about our globe, and hence we see at once why the needle points so steadily to the Pole, and why this simple instrument may be used so safely in directing navigation.

We have seen that the magnetic and the gravitational waves are long waves. Just how long, we do not know, but some of them must be thousands of meters in length. There is observational proof of this, which will be best

(Concluded on page 14

Where Are They, the Plainsmen?

Lure of Gold Which Led Them Along Devious Trails; Custer, the Indians, and Little Big Horn Battle

By F. J. CLIFFORD

THE men who resolutely pushed into the lands of the western Indian, hunted the buffalo and panned the yellow gold from gulch and gravelly bar—where are they? Are they all gone to the great beyond, or are some of them still living, and if so—where are they? What are they doing? How are they spending the evening of their eventful lives?

There is at least one of them alive, a spry old fellow in spite of his threescore and ten years. He lives well to the north end of Kootenay Lake, British Columbia, only a short walk along the beach from the sleepy town of Kaslo. There he has a little snowshoe factory, of which he is owner, general manager, and crew. But his product is known all over the north country, from the boundary line to the Arctic and from Labrador to Alaska.

It is a long, long trek from New London, Connecticut, through Kansas, Montana, the Dakotas, New Mexico, Utah, Arizona, California, Washington, and up the long length of the Kootenay lakes into the very heart of the Selkirk Mountains, yet this is the trek that Ralph N. Kenyon made when he ceased to be a Connecticut sailor and began to be western plainsman.

The land tilts steeply from the very back eaves of his cabin, up, up, up, thousands of feet, until it loses itself in mountains that stretch away, a tumbled snow-capped heap, into the great virgin hinterland of the North, unseen as yet by the white man.

In the seventies when Kenyon left the sea for the frontier, Kansas and Missouri were fairly well west, but not far enough for Kenyon. So he headed northward and in the autumn of '75 arrived in the Black Hills country of the Dakotas.

The year before his arrival, lively times had been seen there. General Custer had been sent in with a company of men to report on the Black Hills, which was a part of the Sioux Indian Reservation.

Ever on the lookout for gold, the soldiers under Custer's orders had sunk "prospect" holes here and there, one of them on French Creek. Four feet down they struck tigrit-gravel and water. H. N. Ross, who accompanied the troops as prospector, scooped up a pan of gravel and started that rotating, rocking movement that throws off the gravel and sand but holds back the gold. The soldiers heeded little until a muttered exclamation brought them crowding round. There in the bend of the pan were the tiny specks of gold. Not very much, but it was gold and ran from four to eighteen cents to the pan.

Prospectors' "Sinking Hole."

General Custer broke camp, crossing back to Rapid Creek, and on to Pierre where, on August 8, he reported the discovery to headquarters.

But news of the find leaked out and quickly a hundred men outfitted at Pierre, South Dakota, and rushed for the Black Hill country. They were turned back by United States troops, who confiscated their equipment.

Following this, two men named, respectively, Wicker and Gordon, had slipped in and built a stockade, inclosing seven buildings, a mile and a half below where the gold had been found. Here with a number of others they spent the winter.

Acting on Custer's report, the government sent Professor Jenny with Ross as guide, to report on the value of the gold discovery. They started out in the spring of '75, traveled up Crazy Woman Fork and over the head of Slate Creek, to Castle and down Little Rapid to where Rockford is now. Three miles below they found some rich "diggings."

Jenny, leaving Ross behind, went up Irish Gulch, over to Box Alder and then out to Bismark. The report he sent out from Bismark was the cause of the great gold rush to the Black Hills.

In October, the government sent General Crook with troops to expel the stampeders from the hills, as it was a part of the Sioux Reservation and, of course, no "white skins" had any right there.

It was about this time that Ralph Kenyon arrived. The action of the government, he told me, caused a big rumpus at the "diggings." One of the men, a Doctor Phlick, had nearly finished building a log hut, when the order came for them to vamose. He was seated on a log talking with Kenyon and a number of other excited miners when a man dressed in soldier's uniform, a bit soiled and worn, joined them.

"I tell you what," the doctor shouted, directing the major part of his heated remarks at the army man, "I'd like to see old General Crook face to face. It would be a pleasure for me to tell him what I think of us being kicked out of here."

"But you shouldn't blame General Crook," the army man remarked. "He is only carrying out the orders of his superior officers."

At this moment, an army officer, Captain Bentien, spick and span in clean uniform, rode up and addressed the other as General Crook. The crowd cooled down when they realized that the man they had been ragging was the old general himself. The doctor was so flustered that he fully expected to be court-martialed, but nothing came of it.

But all the "stampeders" had to get out. Their effects were seized and stored inside the Wicker and Gordon stockade. Six men were selected to guard it. They were Al Gay, Sam Shankling, Dival Trask, Dr. Phlick, Ralph Kenyon and Jud Wood.

Dr. Phlick was the only man possessed of sufficient courage to call down the "buckskin poet," a dreamy-eyed, long-haired person who had drifted in during the late winter. He was decked out in buckskin clothing from head to foot. Now buckskin clothing, Kenyon remarked, is the poorest thing in the world to wear. It isn't cool in summer and is far from warm in winter and is always slick and greasy when wet. A group of buckskin-clad men appears to be permanently kneesprung, the baggy knees of their buckskin breeches giving that impression.

It soon became apparent that the gold-seekers could not be kept out of the Hills, even though the principal mountain passes were guarded by United States troops, and Captain Polleck vacated the Doctor Phlick house, which had served as his headquarters. The "buckskin poet," Jack Crawford, immediately moved in. When Dr. Phlick arrived on the scene the few possessions of Crawford went out unceremoniously.

The "buckskin poet" caught sight of his precious belongings being catapulted from door and window. Slamming open a door, he strode in with flashing eye, and he demanded of the busy doctor by what right he had entered the dwelling. Yankee-like, the doctor replied:

"By what right are you here?"

"By right of possession and occupation," Crawford shouted.

"Well—" Dr. Phlick retorted, "I consider my right of possession stronger and intend my occupation to be longer than yours—so git."

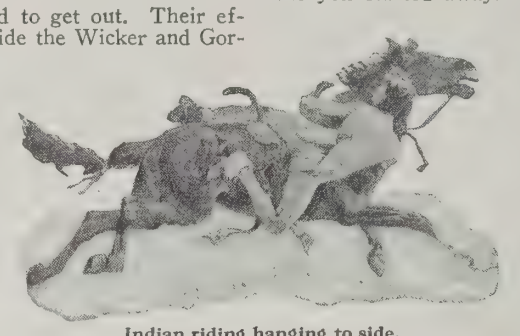
Unbelievable as it may seem, there were during the month of March, 1876, two thousand persons where the present city of Custer is located, but by the following May, this population had dwindled to less than twenty persons. Such was the ebb and flow of the gold-seekers.

Wheeler brothers discovered Deadwood Gulch, a rich "diggings." Jesse Keopler located Rockerville where he

From the painting, "Custer's Last Ride," by W. Montague Cary.

Making thongs for snowshoes by cutting a strip of leather three-eighths of an inch wide from the center of the hide and following round and round.

cleaned up several thousand dollars. Later on he located a store at Camp Cook, now called Pactola. Kenyon was at this place one evening. Half-sick with digestive troubles, due to a long-continued diet of pork and beans and sour-dough bread, he became interested in an eastern immigrant outfit camped nearby that had a cow or two with them. Thinking that the milk might benefit him, he asked the owner for a small pailful. The man poured him out a little more than a quart. Thanking him, Kenyon started away.



Indian riding hanging to side.

"Seems to me," the man remarked in a querulous tone, "that that milk ought to be worth something more than just thanks."

"Name your price," said Kenyon, looking at the man in mild astonishment.

"Well—" that individual replied somewhat hesitatingly, "seems to me it ought to be worth seventy-five cents."

"Come up to the store and we'll weigh out the dust," the sick man replied.

Arriving there, Kenyon laid his poke on the counter instructing Keopler to weigh out seventy-five cents and pay it to the man.

"What's it for?" the storekeeper demanded, questioning the use of so small a sum.

"This milk here," he was told.

"What!" Keopler shouted, "charging you for that little pail of milk?" and he whipped a pair of forty-fives from under the counter and shoved them into the face of the astonished immigrant.

"Git," he yelled, "Git out of here. Pack up your outfit and hit the trail and don't stop till you think you can deal with your fellow men without always weighing it out in dust."

Following the fleeing man down to the camp, he saw that his instructions were obeyed. There he went into a paroxysm of rage when he saw the milk being fed to some hounds the outfit had with them. It was a miracle that the immigrant was not shot, for Jesse Keopler was a hard man and had several killings to his credit. Many of the brutal murders of frontier days were over things of no more importance than that just related.

About this time, numerous reports filtered into the National Capitol of wholesale robbery of the plains Indians. This resulted in the formation of the Star Route Investigation. General Custer, who claimed to be in possession of valuable information, was given the opportunity to tell it to President Grant. The story of this interview came back West in this form, that General Custer's statement was so generally irrelevant that it stirred up the wrath of the President who gave Custer a severe tongue-lashing.

Had it not been for the influence of General Sherman, so the story runs, Custer would not have been allowed his command with Terry, who in the meantime was taking his troops up the Missouri River by boat. Shortly before he got into the country, the Sioux, over on the Rosebud, had administered a whipping to the troops under Crook.

Custer, smarting under the reprimand from President Grant, took the second command and proceeded to do things his own way, although he had instructions to keep in touch with the truculent Sioux and the main command only.

According to the testimony of his own men, Custer's intention seemed to be to instill into the minds of the display-loving red men an admiration as well as a fear of the United States troopers. This is illustrated in the words of Old Whit, one of the 7th Cavalry supply-train packers:

"There was always a brass band with the 7th, as long as 'Old Iron Bottom' (the name the soldiers applied to Custer on account of his penchant for long and hard riding) commanded it. In the early part of the campaign, a steady demand was placed on the services of the musicians. At last they mutinied by throwing away or hiding the mouthpieces of their cornets while the drummer caved in the head of his noise instrument with the camp ax.

"This threw the General into a rage. He dismounted every one of the mutinous men and ordered them to walk until

Mr. Ford's Page

NO GOVERNMENT rises higher than its administration. The form of government may be low, but if its administration is high, it is a good government; much better than a high type of governmental form with a low grade of administration. Forms of government tend constantly to improve, because forms of government are usually determined by the people. But administration tends usually to degenerate, because governments are administered by themselves.

This difference between government and administration becomes acutely apparent from time to time. The people erect a system of government which is designed to do one thing, and they awake one day to find it doing the opposite. They devise a system that will insure their rights, and they find that system used to curtail their rights. They commission a servant and they see it turn into a master. They set up the seat of impartial justice and they see it become the dispensary of partial favor. They create positions of trust and see them turned into places of dishonor.

Not only is this true in those instances of scandal which break into the newspapers, but in routine administrative and in legislative shrewdness. There are "favors" done under cover. It is often an understood arrangement that political support is to be paid for by friendly favors. These are not necessarily of a criminal sort, but they are the entering wedge of the dangerous practice of "using" the government, and the more dangerous practice on the part of the government of letting itself be used.

So general has this become that a man of affairs, in supporting a candidate of his choice, is open to question as to his motives; and such a man should be most rigorous in asking nothing and accepting nothing at the hands of the official whose candidacy he favored. It is not a pretty sight to see "friends" being cared for first—or at all. It is a question whether true friends would consent to have their friendship thus liquidated. When a government goes into office it has no friends; it is the national servant, and it must look to the national interest jealously and with a single mind, as becomes a trustworthy servant.

Legislation seems capable, in whatever form it may be cast, of working oppositely from the intention which commanded the best support for it. The tariff began in a laudable effort to protect jobs of workingmen and render the country self-dependent; it ended in the disgraceful spectacle of non-competitive trusts against which the people had no remedy. From a fence to keep out harm, the tariff became a stockade which kept out the benefits of fair competition. The principle had elements which commended it to honest intelligence; but the administration of it became an oppression.

One could compile a book on the legislation which has passed because of its good promise, but which once passed has been manipulated for private advantage against the public rights.

The wide gap which exists between a good government system and its faulty administration is due to the difference in the motives and the conditions under which the fathers of constitutions and their successor administrators work. The makers of a constitution have to please the people who are to accept it, and the people are best pleased with that form which acknowledges and safeguards their rights, and which gives promise of continuous caution in these respects. They are not, as a rule, office seekers or officeholders, and their chief interest is the idea rather than personal reward from the system they are creating. This will be found to be generally true of the great builders of government.

But with administrators the situation is somewhat different. They are not often intrusted with a creative task, their work is more or less routine, modern politics makes little or no demand on its favorites for preparatory ability in the office they seek, and re-election is always hovering in the near future. The desire for re-election is, of course, natural; it means continuity in a career; it means vindication of character; it may mean any number of blameless things. But it also lends itself to questionable expedients. There are influences which claim, truthfully or not, that they can deliver or withhold certain large blocks of votes. These influences nearly always desire administrative favors. They want to name appointees. They want to dictate policies which have to do with the expenditure of public money. The path of the officeholder whose eye is not single to his duty is strewn with temptations to deviate from the public interest, not criminally perhaps, but sufficiently to break down his own self-respect and in a large degree that proper respect which he ought to have for his office, and which he ought to compel others to have.

Another difference between makers of government systems and administrators of them is this: the former must submit his work to the people for acceptance: the latter is elected and commissioned to go ahead. He is not compelled to submit his administrative work to anybody for approval: he has only to submit his general record at the next election. The work of one must be accepted before it is *done;* the work of the other is *done* before it can be accepted or rejected.

Various proposals have been made to remedy this condition. A large body of opinion proposes that the people themselves pay more attention to the administrative part of government. Just how this is to be done, is not clear. Government administration is a business in itself, and our people have their own business to attend. It is only in places where the people have little else to do that politics becomes their main interest. Our form of government was devised to relieve the people of the care of government, to delegate to others the business of government, and to gain public freedom to attend to the real business of life without which government would be neither necessary nor possible.

It seems a weak counsel that the people should be called upon to do again the business of government which they have appointed others to do. They have instituted the system, given it sanction and authority, carefully marked out the duties to be performed, and have chosen the persons who are to perform them. The rest of their time is taken up with the proper business of life—which certainly is not politics, but which gives politics its standing.

The proper point of attack would seem to be the administrative overseers. We have a form of government which is not only responsible to the people, but the under-administrators of which are responsible to the administrative overseers. Thus, a city government is not elected in all its parts; authority is given the mayor to appoint important heads of departments. The state government follows the same plan. Nationally, we do not elect any of the heads of departments. The President appoints them. He appoints the judges of the Supreme Court. He appoints the Secretary of State. He appoints the heads of the Treasury, the Post Office Department, of Agriculture, of Army and Navy, of national interior concerns—all of these being administrative positions of the first importance. The President is chief administrator and the government chiefs which he calls make up the Administration.

We have preserved the essentials of monarchy in administration in that we have appointed supreme heads of this department and that, and the demand that we should make upon them is that they "be king." Mayors and governors and presidents should be bosses in the highest sense, they should command service and efficiency to the public interest. And where these qualities are not manifest, there should be decisive housecleaning. That will solve the great divergence between our good form of government and our less good administration of it.

THE world admits that we have a good system of government, but we ourselves insist that it is badly managed. An engine may be ever so good, but a bad driver will bring it down to his own level. It is operation, administration, that determines the matter every time. Good doctors help people whatever may be the system of medicine they use; and a good administration is a help no matter how crude the form of government may be. The difference between a good government system and its poor administration is easily explained: the chief administrators are not Bosses in the best sense. The old political "bosses" had that to their credit—they were boss. The limited monarchy is an essential in every job of responsibility. Democracy may be observed to the limit in making plans and reaching decisions, but performance calls for a monarch, a boss. The Committee System is the best for getting nothing done.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Revolt of the Payers

WELL, it has come—the revolt of the income tax payers. But it is in England, and its form is that of an Income Taxpayers' Society. The British income tax payer bears the heaviest tax burden in the world today, almost four times as much as that of Germany, and more than that of France and the United States put together. Indeed, there are indications now that Britain is taxed so heavily as to discourage and dry up the source of taxation, for of the 4,700,000 persons assessed, about 2,500,000 actually pay. This leads to a movement to increase the surtaxes, it leads to talk about the "capital levy" (which is a mild form of confiscation as practiced in revolutions) and these in turn lead to the revolt of the income tax payers who are now organizing for the fray.

Their contention seems reasonable. Recognizing that government costs money and must be paid for, they insist that those who "pay the piper" have the right to "call the tune." People who pay the tax have a right to know why the tax is necessary and how the money is spent. They have a right to insist on economy and efficiency in government, two qualities which everyone knows are less to be found in government than anywhere else.

Britain is in a far worse case than the United States because, high as her taxes are, they are becoming insufficient, and the talk is of higher taxes still. In the United States we are already on the way to lower taxes per capita, though in 1924 the taxes actually collected through internal revenue and income tax represented a 16 per cent total increase over 1923. The income tax total collection alone represented a 9 per cent increase. It cost us about 34½ millions of dollars to collect about 4 billions 500 millions in taxes, or about 1.4 per cent. These figures are made possible by increased efficiency in handling this business, and the reduction of taxes is made possible by greater economy in government.

The feeling is that Britain is not working as hard at this matter as Americans have worked. And even now the British business idea of *collecting* instead of *creating* is largely responsible for the situation in which the United Kingdom finds itself.

The Great Unseen Power

PROFESSOR FREDERICK SODDY, of Oxford University, has this to say: "There is a great unseen power which can make war and peace and render a nation stagnant or prosperous—the power of finance. It is the invisible devil at work producing periodic outbursts of national fury. In overthrowing autocracy democracy has absolutely forgotten all about money, and that the secret of power is the control of currency."

It was not for nothing that some bygone philosopher called money the sinews of war. The Crusaders had to borrow money from the Jews to enable them to lay siege to Jerusalem, Frederick the Great had to do likewise before he could carry on his great campaigns; Napoleon had to finance himself in the same manner before he could set Europe in a blaze, and there has not been a monarch or a petty princeling who has stirred up trouble within the past few centuries but has had to borrow money at usurious rates before a horse could gallop, a man could march, or a gun could be fired.

It has been said that "Jingoism" springs from the feeling that a nation is financially in a position to buy all the munitions of war necessary to smash up somebody or something. The old song says:

> We don't want to fight,
> But, by Jingo if we do;
> We've got the men, we've got the ships;
> *We've got the money too.*

It is the last item that counts, for without the money there could be no ships nor men to man them.

It has been evident for a long time that those who stand to enrich themselves by lending money for war purposes are to be found behind the causes which lead up to international strife.

Professor Soddy thinks that the League of Nations ought to concentrate on the financial factor in war on the assumption that all other war questions would then settle themselves. He thinks that the League should take charge of part of the surplus gold of the world and see to it that it is not misused.

He is of the opinion that if money were issued by a public authority for use for exchanging the products of industry, for facilitating barter, for enabling people to purchase instead of being issued for usury; if it were used to keep pace with the progress of science, instead of being held by the bankers, internal disorders, poverty, and class hatred would disappear.

Men have to be paid for, or supported in, fighting just as in other things. Moreover they have to be clothed and fed and transported. Their implements and tools of warfare are costly and unproductive. They are indeed wholly destructive. Money provides the sinews of war. "It is the great unseen power which can make war or peace." Should not its misuse by international manipulators be made an international crime?

Cannot Assimilate

THE President Emeritus of Harvard, Dr. Charles W. Eliot, is reported to have addressed a gathering of young Jews recently, and seems to have got away with some pretty stiff statements by giving them in a manner favorable to the Jewish notion of exclusiveness. He advised the Jews against trying to become assimilated with Americans—and thus far he was treading in the path of the rabbis and exclusionists and all supporters of the theory of Jewish racial superiority.

But then he went on to say that it was no use trying, because it couldn't be done. The statement was not quite so blunt as that, but that is the sense of it. He even went so far as to say that in his long experience and observation he had never known marriages between non-kindred races to turn out well.

So then he recognizes Jews as a race, which is danger point No. 1; and as an unassimilable race, which is danger point No. 2. But he is right on both points. The worst of it is that the majority of so-called Jews in the United States are not racially Jewish; they are of a race inferior to the pure Semite, and they are indoctrinated with ideas and principles inferior to the great principles of Israel. The pure racial Jews themselves will have to recognize this one day; they secretly recognize it now; and when they acknowledge it, many dark points will be cleared up.

The key to nearly every difficulty in the world today is race. And it is only from races that cause the difficulty that objection to the race idea comes. There are, however, arising here and there authorities who, quite aside from prejudice, are putting the facts of race upon a scientific basis. Such facts as Dr. Eliot has observed are facts, but there are other facts which Dr. Eliot would perhaps be afraid to face, certainly which he would shrink from stating. However, his little address stands almost alone as one which told some truth without causing a bitter comeback.

May Women Smoke?

ONE of the better known clubs of the Middle West has up the question of permitting wives and women friends of members to smoke within its precincts. While the club authorities do not bind themselves to act according to the plebiscite which is being taken, they will find in it an indication of the opinion of those, at least, who vote. One of the curious results thus far is the attitude of a socially prominent non-smoking woman who pleads for the liberty to smoke because, as she says, "the habit is quite general among women today."

Is it? A vote of the readers of this or any other respectable magazine would show that the smoking woman is still a curiosity, to be pointed out in public places and to be spoken of in whispers elsewhere. There are probably hundreds of towns in the United States where no respectable women smoke, and hundreds of thousands of homes in the larger cities where the suggestion would be received as an affront. It would seem to depend on what circles one frequents, whether one regards smoking women as numerous or exceptional. In some circles—the idle, ridiculously provincial "high" circles, and the pathetically sordid or vicious "low" circles—it is doubtless nothing unusual for women to smoke. But it would be pretty safe to say that one-hundredth of one per cent of the female population would be an exaggerated allowance for their numbers.

Not that there is any right which men have which women may not also have. If men may smoke, certainly women may. They may chew tobacco, too, and spit, if they wish. No law will prevent them. They may drink and carouse, as a few doubtless do. If there is no inhibition within the woman herself, she will find no inhibition within the little circle which fancies that this sort of thing is the very farthest frontier of womanly "advancement." But at the same time, the woman smoker whose acquaintance extends beyond a very limited coterie will confess that beyond that coterie she feels the restraint of the general womanliness of the average woman. She doesn't whip out her cigarette case and start smoking anywhere. She probably knows more places where she would not dare smoke than where she would. And the people among whom she would not dare smoke are not less desirable than the others.

There is a danger, of course, in treating the question too seriously. Social decay appears only at the "top" and at the "bottom"—both are essentially the same except in financial means. When it hasn't been smoking, it has been something else—usually much worse. But the earth is not to be judged by the North Pole or the South Pole, there are the temperate regions between, where the people really live. In the temperate region of society is to be found the norm. And it makes the number of smoking women appear few in numbers and weak in leadership.

Walking Into the Same Old Trap

THE bootleg game is repeating in detail the abuses which called down the public wrath upon the saloon, and this may prove the deciding factor in prohibition enforcement. The abuse which did more than any one thing to set the public upon the saloon was its greed for the trade of children. It is part of the liquor history of this country (and within recent months in England) that the liquor interest fought with every conceivable weapon the proposal to keep children out of saloons. It was in meeting the saloon resistance to this proposal of plain decency that the public got in training for the bigger fight.

The bootleg business is repeating the game of annexing youth as a customer. The vicinity of high schools everywhere is infested with gentlemen who peddle the illicit stuff. Mere kids, with too much money for their own good, know in increasing numbers where to get the booze. In a number of cities special investigations have been made along these lines with appalling disclosures.

Now, what will occur sooner or later is this: parents who complacently read in the papers that the bootleggers are busy, and who naturally assume that it only means that the old-time boozers are getting their liquor (as a matter of fact, few people strenuously object to that) are going to catapult out of their easy chairs and explode a yell of wrath that will shake Washington when they learn that it is not the old-time boozers, but their young sons and daughters that are getting the liquor. And when that starts, the bootleggers can kiss their graft goodby. It will all be over.

The complacence of America means that it has not yet caught on to this ancient indecency of the liquor business—the corruption of youth. When the American people learn what is going on, prohibition will be no longer a joke, and prohibition enforcement will become a cruel steel trap.

Preserving the Written Record

The Greatest Libraries of the Old World

By LOUIS C. KARPINSKI

OF MAKING many books there is yet no end, in spite of the fact that since the invention of printing some fourteen million books have been printed with approximately fourteen billion copies. Fortunately some of these countless millions find their way back to the paper mill to begin life with a clean page. However, from the days of the early Babylonians down to the present much time and money have been expended in the effort to preserve the learning of the past. This ability to use the achievements of others, to profit by experience and to make record of that profit, distinguishes man from animal and unconsciously recognition has been given to this vital fact by the great thinkers of all ages. Recently Count Alfred Korzybski gave a new definition of man as the "time-binder" and this man is largely by virtue of written records. One generation of man begins where another leaves off, in large measure, whereas each generation of dogs must begin anew. You may not be able to teach an old dog new tricks but you must teach the new dog all over again the old tricks.

The Kings of Babylon found books weighty affairs, being tablets of clay baked in an oven. A love letter of this type if improperly received might make quite an impression on one's head as well as on the heart. Quite recently a whole library of Babylonian documents was found at Nippur in the Valley of the Tigris and Euphrates, now in the University of Pennsylvania Library. Here are found catalogs of the books in the library, and systematic arrangement of the tablets on shelves of slate under headings of history, law, science, magic, and the like. A librarian was in charge. Most surprising is the fact that even five thousand years ago the "best sellers" received particular attention, with a written list of the books most in demand.

In Egypt and in Greece the papyrus plant yielded material upon which the records of the race were preserved. The papyrus stalk, much like a cornstalk, was split into thin sections and these were placed together in long strips in double layers, horizontally and vertically across, the sap acting as a mucilage. In the Egyptian climate the papyrus records were practically indestructible, but in our variable climate such papyrus records rapidly deteriorate and crumble to dust unless preserved with great care from atmospheric changes. Incidentally from "papyrus" we have the word "paper."

The papyrus records were in the form of rolls and such rolls were preserved in great collections both in Egypt and in Greece. The most famous library center of the Ancient World was at Alexandria in Egypt, under the Greek rule. Here were gathered, in two large libraries, the Serapaeum and the Brucheum, more than half a million rolls. To each roll was attached a little tab as this was the method taken to "keep tabs" on the books.

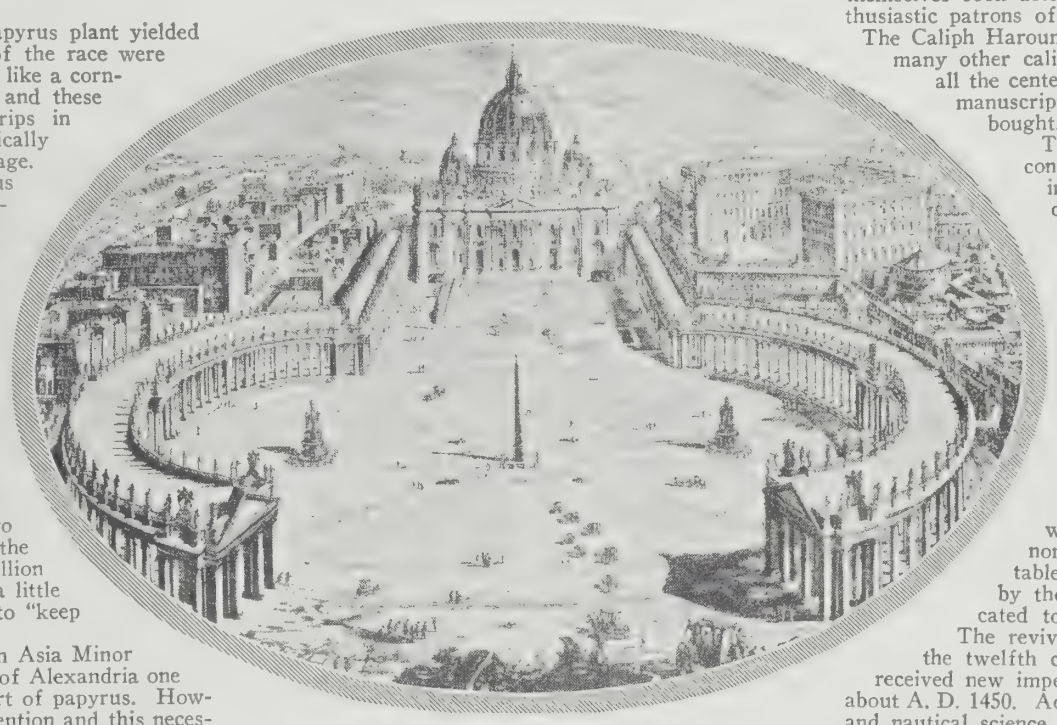
When the rulers of Pergamon in Asia Minor began a public library to rival that of Alexandria one of the Ptolemies forbade the export of papyrus. However, necessity is the mother of invention and this necessity for writing material led to the use of "pergament" or parchment, and even today the college "sheepskin" or diploma is supposedly made of animal skin made smooth on both sides. About the beginning of the Christian Era, Europeans began to make written records on vellum or parchment.

A public library was projected by Julius Caesar with the advice of one of the most prolific Roman writers, Terentius Varro, the library being completed shortly after Caesar's death. A well-known Roman writer, Aulus Gellius, reports the way a controversy was settled in ancient days by reference to the temple library. Just outside the temple of Hercules a party of men, evidently scholars from the form of their dissipation, were on a hot day drinking water made from melted snow when one remarked that many physicians advised against drinking this cold water. Another remarked that Aristotle disapproved also, but about this a dispute arose. There may even have been betting on the side, but, in any event, they hustled into the library for a copy of Aristotle. Taking the roll outside the dispute was settled by the roll.

In California not long ago in some saloon (an extinct institution) a party of men engaged in some similar but less academic discussion flashed different kinds of rolls but left the decision to President Wheeler of the University of California whom they aroused at midnight by long distance phone to settle the bet.

In the time of Augustus Caesar there were more than twenty public libraries in Rome. Here the books were arranged according to subject in presses or cupboards, and also on shelves with pigeonhole arrangements to accommodate all the rolls belonging to one another. Around the room were busts of prominent writers or portraits of authors and other decorations not unlike the interior of a modern library. Private libraries became the fashion among the wealthy, and it was commonly reported that many of the owners were more familiar with the outside of the rolls than with the inside, "deriving their greatest pleasure from the beautifully inlaid bookcases and from the tabs."

In that long period of European history when education was centered in the church, in the cloisters and monasteries, books became in the monasteries an absolutely essential element in the maintenance of high standards of living. In large part libraries were concentrated in the church institutions with provision for use largely



St. Peter's, Rome, and Vatican at right.

by those connected with the church. It is interesting to read that the librarian was enjoined "frequently to dust the books carefully," that readers were strictly cautioned not to make any corrections or other marks in the books, and to be extremely cautious in turning the leaves. The custom of borrowing books and neglecting to return them seems to be exceedingly ancient as at the end of many a manuscript is written, "May whoever steals this manuscript be anathema." Certain it is that these numerous church and convent libraries saved many manuscripts from destruction. Even today in almost every European country important collections of early

Fifteenth Century Library, reproduction from an old manuscript prepared for Henry the Seventh of England.

manuscripts and books are frequently found in the little libraries which trace directly back to the institutions of the Middle Ages.

The Arabs are commonly charged with the burning of the Alexandrian library. However, it is now well established that Christian emperors accomplished this destruction rather than the Mohammedans. The Arabs themselves soon after A. D. 700 became the most enthusiastic patrons of learning and also book collectors. The Caliph Haroun al Raschid had his agents, as did many other caliphs both before and after him, in all the centers where books were found, buying manuscripts and copying such as could not be bought.

The library at Cordova is said to have contained 600,000 books with a catalog in forty-four volumes. The Arabs diligently studied the astronomy and mathematics of the Greeks and many Greek works are preserved today only in Arabic translation. The Arab introduced the short story into Europe and the Arabian Nights' tales set up a new type of literature which continues even today in our weeklies and which can be obtained for a nickel.

The Arabic passion for learning participated in some measure to make possible the discovery of America. Algebra, itself an Arabic word, and arithmetic, with trigonometry and astronomy and their tables, and navigation were all cultivated by the Arabs and were later communicated to Europeans in Latin translations. The revival of learning in Europe began in the twelfth century with such translations and received new impetus with the invention of printing about A. D. 1450. Advance in geographical, astronomical and nautical science was made possible by the achievements of the Arabs, and numerous of the earliest printed books touch these fields.

The printed book inaugurated a new era in libraries, making possible the wider and more rapid dissemination of knowledge. In no small measure the printed book and the public library contributed to the cause of democracy as indeed the libraries do today.

Among libraries of the world first place in importance for those who speak English must be accorded to the British Museum.

The early English kings were not given to extensive book collecting. However "many a mickle makes a muckle" and so the contributions of the numerous hold-

Mr. Murphy Becomes a King

"Potato Day" in the San Joaquin Valley, California

King Potato—the largest "murphy" grown in the San Joaquin Valley in California, supported by his chief lady-in-waiting, Mrs. Alton Healey, who thus shows her affection for the ruler of the valley for one day.

By HARRY H. DUNN

MOST productions of the earth in America have had their day of domination. Rose tournaments, flower festivals, cotton carnivals, peach pageants, even rhubarb revels, have been held to celebrate the value of American agricultural and horticultural products. But it has remained for a county in California to bring from the soil the lowly growing potato, to make it a king for a day, with a governor, the man who developed the most valuable of all potatoes, state, county, and city officials, and hundreds of beautiful women and girls paying tribute to Monarch Murphy.

The Irish came into their own by proxy at this *fiesta,* when Stockton, one of the chief cities of the San Joaquin Valley, decided to establish and maintain a yearly carnival to be known as "Potato Day," and held the first such celebration on October 18, 1924. The idea originated in the mind of J. V. Mendenhall and resulted in the presence, by representation at least, of 27,000 of the 52,000 acres of "murphies" in California this year. What at first appeared to be merely a small local celebration, with possibly a boatload or two of people coming up the San Joaquin River from other cities to take part, became a permanent festival, comparable with the Georgia Peach Pageant, the Memphis Cotton Carnival, or the Fresno Raisin Day celebration. In fact, the potato is to the upper San Joaquin Valley what the raisin is to the lower valley, down Fresno way. It is a permanent crop, worth around five million dollars last year in this section, and more than ten million to the entire state, so that the birth of a pageant commemorating the history and value of a product of American soil leaps at once from local to national interest.

Friend William Richardson, governor of California, thought so much of the celebration that he traveled from Sacramento to Stockton to see "Mr. Murphy" crowned. Luther Burbank, the beloved plant magician of Santa Rosa, was there to dig up the first hill of Burbank potatoes in the record tract which produced nearly 500 bushels to the acre. Helen Wills, California's tennis wonder and herself a record-breaker, watched the murphies break some records themselves. Half a score of towns and small cities sent their most beautiful girls to be princesses in the train of Alice Knudsen, queen of Potato Day. Henry Hansen was crowned king, since King Murphy has only eyes and no ears with which to hear or hands with which to hold a scepter. Anita Ohm was the beautiful Princess Stockton, and, as the Irish were not represented in the court of the Potato, Mrs. Alton Healey was appointed to the place of special maid to the monarch of the tubers.

They had a long parade, with floats, a program of sports on the river, a prize of six sacks of "spuds" for the largest family present, and, finally, King Potato and Queen Delta were crowned and inaugurated to reign until next Potato Day in Stockton. This was the greatest festival in honor of an agricultural product ever held in California, exceeding in number the attendance at the Blossom Fête, when the Santa Clara Valley orchards burst into bloom, and surpassing in economic importance the Tournament of Roses at Pasadena.

To Luther Burbank was presented a potato made of solid gold, in commemoration of his development of the Burbank potato, which made a record production of 56,240 pounds to the acre on a four-acre test-tract. The gold potato was made in the form of a watch charm and bears the words:

"Presented to Luther Burbank, originator of the Burbank potato, by the people of Stockton, California, Potato Day, October 18, 1924."

Potatoes were produced which were grown in 1902, twenty-two years ago, and preserved by petrification. The difference in size between the potato of 1902 and the same variety today was a remarkable demonstration of the development of an agricultural product. Next to the Burbank potato, which made the record production, came the Netted Gem, with 47,478 pounds to the acre; Pride of Multnomah, with 47,238 pounds; Wisconsin Pride, 45,672 pounds, and Earliest of All, 37,387 pounds. A record of 481 sacks of potatoes to the acre is held in the San Joaquin Valley. These yields were made on fertilized lands, but in ordinary commercial production, similar to that going on in the entire 27,000 acres planted to potatoes in the valley.

And that at least a day a year should be devoted to recognition of the Monarch Murphy, seems reasonable when it is considered that the people of the United States, in 1923, ate more than 410,000,000 bushels of potatoes, or about 3.75 bushels per capita. These figures, of course, do not take into consideration the thousands of small potato "patches," whose production is consumed without record in the home of the grower. Many dwellers in rural sections of the country also buy their potatoes from what are known as "non-commercial sources," that is, from their neighbors, and direct from the farmers of their districts, so that no record is kept of this consumption. Dealers in potatoes believe that the consumption of this vegetable in the United States is well above four bushels per capita every year, meaning that something like half a billion bushels of potatoes are eaten in this country every twelve months.

California alone, in 1923, produced on 52,000 acres of land a commercial crop of 7,800,000 bushels of potatoes, valued at $10,140,000. This means an average yield of 150 bushels to the acre, valued at approximately $1.30 a bushel, or $195 an acre, according to *The Mercantile Trust Review of the Pacific,* which recently made an exhaustive survey of the "Murphy" family in this country. A bushel of potatoes weighs 60 pounds, which is to say that 24,600,000,000 pounds of potatoes went down the throats of Americans last year. With the non-commercial production added, it is probable that the figure is more nearly 30,000,000,000 pounds.

Further figures obtained from the same source on the 1923 potato crop for the entire United States show that 412,392,000 bushels were grown on 3,816,000 acres of land. This crop gave an average yield of 108.1 bushels an acre, and its average value was 82.3 cents a bushel. This price gave the crop an acre value of $89—as compared with $144.83 in 1919. The total value of the 1923 crop of potatoes in the United States is placed at $339,322,000, an economic factor in the nation's life which should give "Mr. Murphy" a clear title to at least one day of celebration every 365 days. The figures on production and value of potatoes in California, as just collected, are of interest for comparison with those above mentioned for the entire nation. As has been said, the potato-growers of California harvested a crop of 7,800,000 bushels from 52,000 acres in 1923, giving an average yield of 150 bushels an acre, as compared with a national average yield of 108.1 bushels. The average price received for the potatoes grown in California was $1.30 a bushel, which compares with 82.3 cents a bushel as the average for the entire United States. The value of crop an acre in California was $195, or more than twice the national average of $89, while the total value of the California crop of $10,140,000, or about three dollars for every inhabitant of the state.

In spite of this large crop, California is compelled to import great quantities of potatoes from Washington, Oregon, Idaho, and Nevada. While exact figures are not available, potato dealers estimate that the Golden State, with a production of 7,800.000 bushels, and an unknown consumption from "non-commercial" sources, actually imported nearly 5,000,000 bushels of potatoes in 1923. The crop from the 27,000 acres, which recently celebrated Potato Day at Stockton, will total more than 4,000,000 bushels, according to present indications, or more than half the entire crop of the state in 1923. This industry offers a clear object lesson of the success of modern industrial and business methods applied to agriculture, not only in California, but throughout the United States, insofar as production is concerned.

Merchandising of the potato crop, since it has fallen into the hands of the Sapiro co-operatives in many sections of this country, has not been so successful, as witness the fact that the crop from 3,952,000 acres sold in 1919—before they came into the industry—for $571,368,000, while crop from 3,816,000 acres, sold in 1923, after Aaron Sapiro and S. G. Rubinow had obtained a grip on it, for $339,322,000. That is to say, with a *reduction* of 136,000 acres in production, the return to the farmers of America fell off more than $232,000,000. That, however, is merely one chapter in the history of "Mr. Murphy" on his way to the throne on which he was placed at Stockton.

The farmer who produces potatoes seems to have

(Concluded on page 14)

A plot of San Joaquin Valley ground which produced 298 sacks of potatoes to the acre. The potato acreage in the valley is approximately 27,000 as compared with 50,000 acres in the entire State of California.

Loading some of the huge potato crop of the San Joaquin Valley on a barge for shipment down the San Joaquin River to market at San Francisco.

The modern machine digger produces potatoes out of the ground faster than a score of men with forks could turn them up, and the gasoline engine is the power that pries the murphies loose from the earth. Scene in the San Joaquin Valley, near Stockton.

St. George's U. F. Church, Edinburgh.

St. George's, Old Edinburgh

Presbyterian Stronghold in the Modern Athens

By WILLIAM L. STIDGER

ST. GEORGE'S FREE CHURCH, of Edinburgh, looms like a lighthouse in the religious history of Scotland. St. George's is set down in the midst of beautiful Edinburgh's downtown section, where the throngs of humanity, like great tidal waves, ebb and flow.

One characteristic of Free St. George's is that its ample auditorium is always crowded with people. I was told by men who have known the church from its earliest history, that this church, which can seat nearly two thousand, is always overflowing with those who attend its services.

Another characteristic is the long service of its pastors. This is quite general in Scottish churches, but more particularly true of Free St. George's.

Located at one end of the main thoroughfare of Edinburgh, Princess street, its beautiful steeple can be seen all over the city. Across from it is the famous castle, one of the most interesting historic piles in Europe, its marvelous gray architecture crowning a great hill. Within sight of Free St. George's Church is the beautiful monument to Sir Walter Scott and not far off is St. Giles' Cathedral, the preaching place of the immortal John Knox.

Monument to Sir Walter Scott, Edinburgh, Scotland.

St. George's Free Church was born of the famous separation from the State church of Scotland, which was led by that valiant apostle of ecclesiastical democracy, Dr. Thomas Chalmers. Three hundred members of this disruption united to form St. George's United Free Church.

Dr. R. S. Candlish, a name famous in Free Church history in Scotland, was the first pastor of the new free kirk. Born in 1806, dying in 1873, he served Free St. George's all of his active ministry.

Dr. Alexander Whyte, famous throughout Protestant circles, was an assistant to Dr. Candlish for several years and upon the death of the founder was called to this pulpit. He, in turn, served for forty-four years, preaching during the entire period to vast throngs.

A tradition, firmly established in this church, is that the assistant pastor shall succeed the pastor when he is called elsewhere or when he dies. The plan is to get the best man it is possible to find as an assistant—and not to seek an inferior man. "A man who is worthy of being an assistant in this city church is worthy of being its minister. We select our assistant as carefully as we select our minister. Thus we always have two great preachers on our staff," said an official of the vestry.

Under Dr. Alexander Whyte the church grew from a membership of 500 to a membership of 1,800. There are 1,400 of what the Scottish call "let seats," meaning seats that are rented and paid for by members and friends. In addition to these "let seats" there are 400 seats for the general public. At the Sunday services, the "let seats" are kept for pew-holders up to within five minutes of the services, and then they are thrown open to the general public.

This system, which is generally prevalent in England and Scotland, makes it necessary for visitors and all who are not pew-holders, to "cue up," or stand in line as Americans do for a popular theater or a baseball game. It is not exactly to an American's liking, and I doubt if American people would long continue to put up with the system. However, it is an interesting sight to see a thousand persons standing in line to get into a church service. The Sunday I was there, at least 500 persons were turned away.

St. George's has sent two of its ministers to churches in the United States—Dr. Hugh Black, who is now at Union Theological Seminary, New York; and Dr. John Kelman who succeeded J. H. Jowett at Fifth Avenue Presbyterian Church, New York, and later became minister of a church at Frognalls, London.

To this day, they will tell you in Edinburgh that Dr. Kelman has made only one great blunder in his remarkable career as a world-famous preacher. When you ask them what that mistake was, they will tell you that his great strategic blunder was leaving Edinburgh after a ministry of only twelve years. That was too short.

The present minister of Free St. George's is Dr. James Black, but recently made a Doctor, as they point out to you, with a grim sense of propriety, adding, "You Americans call every preacher a doctor. We only call him a doctor when he gets his degree; and it must be an *earned*, and not a *conferred* degree." Dr. James Black is the brother of Hugh Black and the church is still crowded with worshipers every Sunday. The present Dr. Black came to St. George's following Dr. Kelman in 1921.

The finances of this church are handled in an unusual manner. No mention of money is ever made from the pulpit. The pew-renters are supposed to pay set amounts for their favorite seats, and there are boxes at the doors for those who wish to contribute. The minister's salary, which is a matter of public knowledge in the United States, is not so in Scotland. When I asked what salary was paid to the ministers of Free St. George's, the Scotch official who was giving me the interview, looked as if I had tried to steal his purse. He gave me to understand, in rather direct fashion, that such matters were not discussed publicly in Scotland.

"Do not even the people who pay the preacher's salary know what it is?" I asked.

"Naw mon!" was the answer.

When I told him that a congregation in the United States would be unwilling to pay salaries and bills about which they knew nothing, he looked as if he had his doubts about their spiritual consecration. However, it is known that American salaries are at least 50 per cent higher than they are in English and Scottish Protestant churches. They are not called "salaries" but "stipends." When John H. Jowett came to Fifth Avenue Church he refused to take more than $10,000 of the salary offered him—adhering to the principle that living expenses were all that a minister could receive. He soon found out how inadequate that sum was even for him.

Free St. George's has no elaborate, carved pulpit such as Westminster Chapel; no great white pulpit, such as the City Temple; no marble pulpit such as Christ Church, London. Its pulpit is very ordinary, small, ancient-looking, with no elegance. It is a church in which common people would feel at home. There are no dim religious lights; few stained-glass windows, and those not famous. Its single gallery is commodious but inelegant. The floors look as if they had been badly trampled. The interior, by American standards, even by London standards, is shabby-looking. It is more like a great hall than a church.

But two things redeem its shabby appearance. First its beautiful exterior. The other redeeming thing is the memory of the great souls who have preached from its pulpit.

Story of Croesus

By HERODOTUS

SOLON, the Athenian lawgiver and patriot, when asked by Croesus who was the most happy he had seen, replied:

"Tellus the Athenian. Tellus lived in a well-governed commonwealth; had sons who were virtuous and good and he saw children born to them all, and all surviving: in the next place, when he had lived as happily as the condition of human affairs will permit, he ended his life in a most glorious manner; for, coming to the assistance of the Athenians in a battle with their neighbors of Eleusis, he put the enemy to flight, and died nobly. The Athenians buried him at the public charge in the place where he fell, and honored him greatly."

Croesus, being enraged, said: "My Athenian friend, is my happiness, then, so slighted by you as nothing worth, that you do not think me of so much value as private men?"

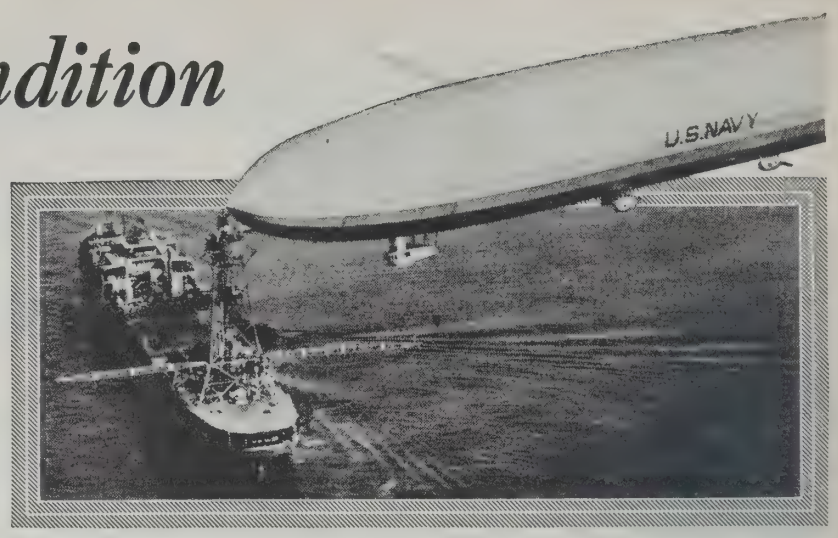
Solon answered: "Croesus, you appear to me to be master of immense treasures, and king of many nations; but as relates to what you inquire of me, I cannot say till I hear you have ended your life happily. For the richest of men is not more happy than he that has a sufficiency for a day, unless good fortune attend him to the grave, so that he ends his life in happiness. Many men who abound in wealth are unhappy; and many who have only a moderate competency, are fortunate. He that abounds in wealth, and is yet unhappy, surpasses the other only in two things; but the other surpasses the wealthy and the miserable in many things. The former, indeed, is better able to gratify desire, and to bear the blow of adversity. But the latter surpasses him in this: he is not, indeed, equally able to bear misfortune or satisfy desire, but his good fortune wards off these things from him; and he enjoys the full use of his limbs, he is free from disease and misfortune, he is blessed with good children and a fine form, and if, in addition to all these things, he shall end his life well, he is the man you seek, and may justly be called happy: but before one dies we ought to suspend our judgment, and not pronounce him happy, but fortunate. Now it is impossible for any one man to comprehend all these advantages; as no one country suffices to produce everything for itself, but affords some and wants others, and that which affords the most is the best; so no human being is in all respects self-sufficient, but possesses one advantage, and is in need of another: he, therefore, who has constantly enjoyed the most of these, and then ends his life tranquilly, this man, in my judgment, O King, deserves the name of happy. We ought therefore to consider the end of everything, in what way it will terminate; for the Deity having shown a glimpse of happiness to many, has afterward utterly overthrown them."

When he spoke thus to Croesus, Croesus did not confer any favor on him, and holding him in no account, dismissed him; since he considered him a very ignorant man, because he overlooked present prosperity, and bade men look to the end of everything.

What Is the Present Condition of Our Navy?

Have the "Old Fogies" or Our Statesmen and Politicians Allowed Our Naval Power to Run Down?

By STEPHEN POOLE



The *Shenandoah* moored to the U. S. S. *Wright*, aircraft carrier.

WHY did American naval officers tow the uncompleted battleship *Washington* out to sea and sink her with bombing and target practice?.

Is the United States sinking American battleships while other nations who engaged in the 5-5-3 Treaty are ignoring the terms of the Treaty and destroying only blue prints? Or are other signatories to the Treaty faithfully complying with its terms?

What is the condition of the American Navy today? Has it been allowed to run down, and are we below our allowance under the Treaty terms?

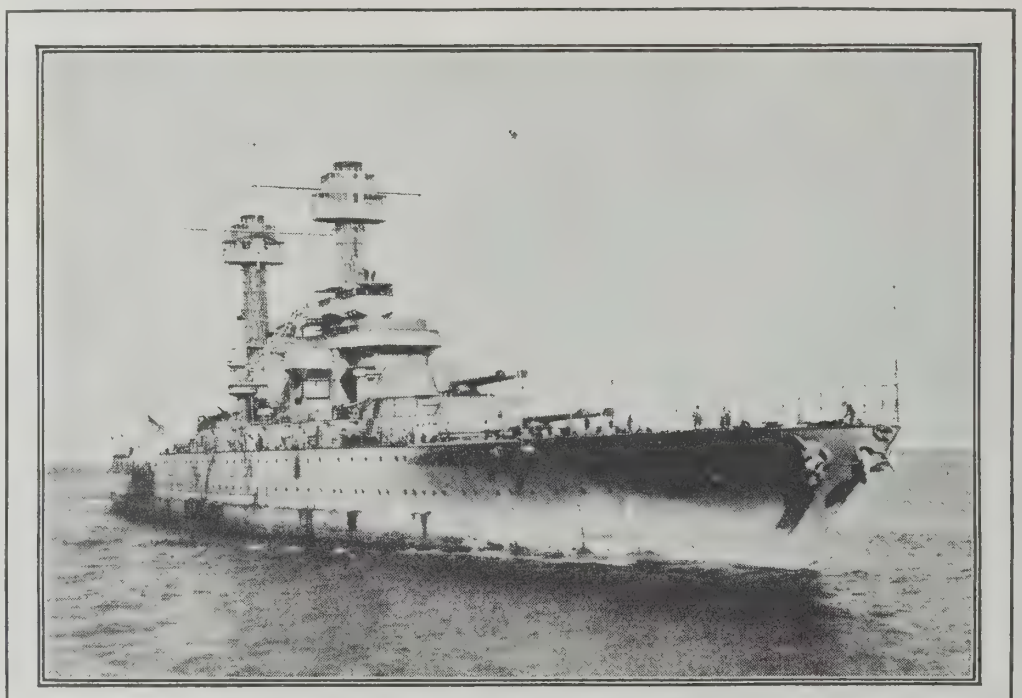
What about the battleship and aircraft controversy? Is the former obsolete and has the advent of aircraft swept it from the seas?

These and similar questions have passed through the minds of American citizens during the past few weeks. There has been a sudden stir of public interest in the condition of our navy. *What is the truth about it?*

One thing can be said for our Army and Navy officers: When you approach them seeking proper information, you usually get it. This cannot be said for all government servants in Washington. An Army or Navy officer will give you his answer straight from the shoulder—if the information is permissible you get it; if not, you are told so.

Only a few days ago I interviewed one of our best-known admirals and put a question to him that involved a criticism of the Arms Conference Treaty. Like a flash he responded: "Sir, naval officers are not responsible for treaties. It is not for us to criticize or commend them. That is a question for the Executive and the Senate. They give us our orders and it is up to us to obey them."

So much for our alleged danger of militarism. Our officers completely recognize the authority of the civilian servants of the people. Military? Yes. Militaristic? No!



The pride of our navy U. S. S. *West Virginia*.

The question of the present fitness of our navy involves, in the first place, our obligations under the Arms Conference Treaty. There is a sharp division of opinion as to whether a great national mistake was made in the framing of the Treaty. However that may be, it should be definitely understood that naval officers did not frame the Treaty. They were requested to compile certain data; they doubtless made recommendations, but it is a safe assumption that their recommendations were largely ignored.

The nations entering the Treaty limiting naval armament agreed to regulate their naval strength principally in what is known as capital ships, to wit, battleships. (Sometimes battle cruisers are so listed.) The Treaty itself sets forth the names of the ships to be scrapped and those to be retained. Provision is made for replacement of the capital ships retained at the expiration of twenty years, as it is estimated their usefulness would have ceased within that time. It was agreed that the following capital ships could be retained:

UNITED STATES

Name	Tonnage	Name	Tonnage
Maryland	32,600	*New York*	27,000
California	32,300	*Texas*	27,000
Tennessee	32,300	*Arkansas*	26,000
Idaho	32,000	*Wyoming*	26,000
New Mexico	32,000	*Florida*	21,825
Mississippi	32,000	*Utah*	21,825
Arizona	31,400	*North Dakota*	20,000
Pennsylvania	31,400	*Delaware*	20,000
Oklahoma	27,500		
Nevada	27,500	Total tonnage	500,650

BRITISH EMPIRE

Name	Tonnage	Name	Tonnage
Royal Sovereign	25,750	*Iron Duke*	25,000
Royal Oak	25,750	*Marlborough*	25,000
Revenge	25,750	*Hood*	41,200
Resolution	25,750	*Renown*	26,500
Ramillies	25,750	*Repulse*	26,500
Malaya	27,500	*Tiger*	28,500
Valiant	27,500	*Thunderer*	22,500
Barham	27,500	*King George V*	23,000
Queen Elizabeth	27,500	*Ajax*	23,000
Warspite	27,500	*Centurion*	23,000
Benbow	25,000		
Emperor of India	25,000	Total tonnage	580,450

JAPANESE EMPIRE

Name	Tonnage	Name	Tonnage
Mutsu	33,800	*Kirishima*	27,500
Nagato	33,800	*Haruna*	27,500
Hiuga	31,260	*Hiyei*	27,500
Ise	31,260	*Kongo*	27,500
Yamashiro	30,600		
Fu-So	30,600	Total tonnage	301,320

Under the terms of the Treaty, the United States was allowed the completion of two ships of the *West Virginia* class, after which we were obligated to scrap the *North Dakota* and the famous old *Delaware*. This has been done. With these ships scrapped the total tonnage to be retained by the United States was fixed at 525,850 tons.

The British Empire is allowed the construction of two new ships that will probably be complete in 1926. Upon their completion the four old ships, *Thunderer, King George V, Ajax* and *Centurion,* are to be destroyed. The two new ships under construction are not to exceed 35,000 tons each. After the scrapping of the four old ships mentioned the total tonnage of the British Empire will be 558,950 tons.

No capital ship is allowed to carry a gun with a caliber in excess of 16 inches.

Aircraft carriers are allowed as follows: British Empire, 135,000 tons; United States, 135,000 tons; Japanese Empire, 81,000 tons.

It will be recalled that this is a Five-Power Treaty, but since the navy power of France and Italy is comparatively small the figures relating to them need not be given here.

The terms of the Treaty provided that "A vessel to be scrapped must be placed in such condition that it cannot be put to combatant use." It is necessary either to break the vessel up, or convert it to target use exclusively.

What about this Treaty? Are the signatory Powers living up to it? Secretary of the Navy Wilbur, on December 8, 1924, said: "Each signatory power has carried out with scrupulous exactness the Treaty provisions."

It is not likely that a responsible official would give such assurance to the American people unless he had most convincing information that it was true.

The United States could not publicly send a representative of our government abroad to check up on what the other powers are doing. Imagine the indignation that would sweep this country were England or Japan to send an envoy here to take an inventory of our fleet. Nations still maintain some appearance of national honor and when they give their word for these matters they expect it to be taken. However, we may safely assume that no country is depending absolutely upon what the other says. They have their own avenues of information, which are usually accurate and extensive. So, when our Secretary of the Navy makes the statement

Destroyers.

that other nations are carrying out the Treaty provisions "with scrupulous exactness" we may have some confidence in the statement.

Thus it follows that the battleship *Washington*, being listed in the Treaty as one of the ships to be scrapped, the time limit for its scrapping expiring February 17, 1925, no blame attaches to our naval officers for her sinking. Had they waited until the last day they would have had to open her pet cocks, let her fill with water and sink to the bottom, they would have thrown away an opportunity to increase their technical knowledge as to the value of these post-Jutland ships in resisting attack.

When I discussed the sinking of the *Washington* with a high naval officer, who in his time had sent some of our old ships to the bottom, he said: "Do you suppose that naval officers took any pride in sinking the *Washington?* Some of them had tears in their eyes. I know that I had when I sent some of our old ones down. You must remember that naval officers take great pride in the construction of these ships. It is heartbreaking to destroy one of them. But, there is our Treaty and the navy must not be responsible for its violation. We did not frame the Treaty, but we must obey orders and carry out its provisions when so directed."

There were, it is said, valuable lessons learned in the sinking of the *Washington*. Naturally, our officers do not publicly state what those lessons were. Some things, however, can be told. The first news reports that the *Texas* had been firing on the *Washington* for three or four days were inaccurate. The first few days were given over to bomb experimentation. The *Washington* was a post-Jutland type of ship, that is, she was constructed after the battle of Jutland, participated in all the lessons learned in that great naval engagement, and, therefore, had a great many modern improvements. This vessel embodied the latest ideas of naval architects. Were those ideas good ones? The tests made in sinking the *Washington* answered these questions.

In these tests bombs were placed at vulnerable points and touched off, and the effect noted. For instance, there would be placed near a vulnerable point of the ship, below the water line, a bomb of the same pressure and contact as a torpedo striking the ship at that point. Then bombs were placed at various points on the deck, to note the effect of aircraft bombing; bombs of given sizes, corresponding to some naval problem, were touched off in the water at various distances from the ship. Then the air fleet was allowed to make its attack, and this was followed by the guns of the *Texas*. In this way the greatest ship ever constructed was sent to the bottom of the sea. It would be foolish to say that valuable facts were not learned. Of course, our naval officers would have preferred to keep the ship, but, again, we must remember the terms of the Treaty. If criticism is justified, then it should be directed against our *statesmen* who formulated the terms of the Treaty.

There is no question that our Treaty obligations demand that our naval position shall not exceed a 5-5-3 ratio. We must keep our naval strength down to that. BUT—is there not also the obligation on our part *to maintain our ratio?* Is it not a duty to keep our naval strength up to our ratio?

What about our condition in this respect? Are we up to our allotment, or have we fallen below it? The Treaty gave us the right to modernize some of our older battleships. We shall avail ourselves of this by giving some of our older ships increased deck protection against aircraft, and also by giving them under-water blisters—a "blister" being another hull built over the old one—as protection against torpedoes. These are our privileges and our plans, but they are not yet actualized.

Secretary Wilbur states that "We have not yet availed ourselves of the opportunity to modernize our ships permitted under the Treaty and thereby preserve the ratio contemplated."

He also says: "To postpone the modernization of those ships is to gamble upon the chances of war during the next ten years and to increase the possibility of such war by that degree of unpreparedness."

A bill, introduced last session of Congress, passed, and held up on a motion to reconsider until this session, providing for the necessary modern alterations of six of these ships, has recently been passed by the Senate and sent to the President. It is one important step in the right direction. There is also the question of "blisters" for under-water protection for seven other ships. New legislation is proposed to take care of this matter, and when the work is authorized and completed, we shall then be in our proper ratio as to capital ships, excepting in the matter of gun elevation.

The bill just passed by Congress also provides for the construction of eight scout cruisers and six river gunboats.

The table given on this page shows the figures as October 1, 1924, which indicate the comparative situation with regard to capital ships.

The figures for the British Empire include the four ships which are to be scrapped in 1926 and the two ships now building to be added to the fleet.

On aircraft carriers, the figures, as of same date, are as follows:

The United States has one ship of 12,700 tons already built, and is building two ships of an aggregate tonnage of 66,000. This will give us three of these ships with a total tonnage of 78,700. Under the Treaty we are allowed 135,000 tons in this kind of ships, and no ship in excess of 35,000 tons can be built. We need, therefore, to build two more ships of an aggregate of 56,300 tons, to reach our allowance.

The British Empire is in a somewhat better condition with reference to this kind of ships. It has 3 ships of 48,190 tons already built and is building 3 ships of an aggregate of 56,300 tons. This will give her 6 ships with a total tonnage of 104,490. She is allowed 135,000 tons under the Treaty and can, therefore, build one more ship of 30,510 tons.

The Japanese Empire has one such ship of 9,500 tons already built, is building 2 more of an aggregate of 53,900 tons; is allowed under the Treaty 81,000 tons and can, therefore, build one more of 17,600 tons.

The Arms Conference Treaty consigned to the scrap heap some of the greatest ships ever planned, a few of which were actually under construction and others authorized. The United States has scrapped 11 new ships, the latest one being the *Washington*. With the ships that were building, our navy would have been beyond question the greatest in the world, and other world powers would have had to acknowledge our superiority. The Treaty prevented our reaching naval superiority. We are certainly in second place today, and measured as an efficient fighting force we may even be third.

One thing is felt to be of such vital importance that many serious men feel we must do it, and that is, pass legislation authorizing the elevation of the guns on our capital ships. There has been strong intimation that the British Empire would object on Treaty grounds, but such an objection on such grounds would probably be hard to sustain. If the Treaty can shackle this nation in such a matter, we have indeed got ourselves into a mix-up. As a matter of fact, France has already elevated her guns and no question has been raised. We have the same right.

Summing up, we find that on such ships as are limited by the Treaty we must put new boilers in some; we must provide anti-air-attack deck protection for others; and for some we must provide protection against submarine attack, and on a great many of our ships *we must elevate our guns!* In other words, we need—in the way of alterations and repairs allowable under the Treaty—virtually to build over about half of such ships as constitute the backbone of our fleet! Some of these battleships, in event of protracted war, would not be able to maneuver with the fleet, because their boilers are in such condition that they would not stand sufficient steam-pressure to make the speed. A ship that cannot keep up with the fleet is practically worthless. It is true we have made temporary repairs on some of the boilers, but there should be nothing temporary about them. They might stand the strain of a navy drill tomorrow and then break down under the strenuous tests of a sea battle.

Next, we need to complete the two aircraft carriers we are now constructing, and build the other two allowed us under the Treaty. This would give us a little advantage over the British Empire, although they can still build one more.

We must get along with our worked-over battleships until 1931 when we start gradually replacing them with new ships.

Now, how do we stand with reference to other ships that are not limited under the Treaty?

The United States has 9 light cruisers of a total tonnage of 67,500, and has one building of 7,500 tons. The bill recently passed authorizes the construction of 8 more.

The British Empire has 47 light cruisers of a total tonnage of 223,530, is building 10 more of a tonnage of 94,850.

The Japanese Empire has 18 light cruisers of a total tonnage of 91,440, and is building 10 more of a total tonnage of 79,565.

Thus the United States is comparatively deficient in light cruisers.

The United States leads in destroyers, with 288 of a total tonnage of 342,086, including 14 light mine layers of the destroyer type. None of these are "leaders," that is, a destroyer in excess of 1,500 tons. Most of these boats were laid down during the World War in an emergency program to combat German submarines, and many of them are of hasty construction. The greater number of them are tied up in navy yards without crews. There are only 109 of these ships in commission.

Our ratio in destroyers stands: United States, 9.77; British Empire, 6.95; Japanese Empire, 3.00.

In fleet submarines—submarines capable of fighting with a fleet—we have 3 of a total tonnage of 3,318; they are, however, all out of commission due to engine failures. We have 4 building of 6,375 total tonnage. Another, of the mine-laying type, not yet laid down, is not described, probably for official reasons.

The British Empire has 8 fleet submarines built of 16,460 total tonnage and one building of 1,480 tons.

The Japanese Empire has 1 of 1,400 tons and 22 building of 34,310 tons.

Japan is far in the lead with fleet submarines, the United States holding a poor third.

The story is somewhat different in first-line submarines, which might properly be called "coast defense submarines."

The United States has 44 built of a total tonnage of 38,386, and is building 6 more of 5,436 total tonnage.

The British Empire has 32 built of a total tonnage of 31,030 and 2 more building of a total tonnage of 1,780.

The Japanese Empire has 36 built of 29,764 total tons and 7 building of 6,994 total tons.

We lead slightly in this type.

It will be observed that in numbers and tonnage not limited by the Treaty we compare favorably with the other powers, with the exception of fleet submarines and light cruisers. It must be borne in mind, however, that a great many of the vessels, particularly destroyers and fleet submarines, which are listed as part of our strength, *are not in commission* and *the construction of a great many of them is not of the best.*

Preserving the Written Record

Concluded from page 9

ers of the royal office formed ultimately a notable collection which in 1757 was given by George II to the nation and became a part of the present British Museum collection. Included in the Royal Library was the famous Biblical Codex Alexandrinus, one of the earliest whole Bibles extant, presented to King James I, in 1624, by Cyril Lucar, Patriarch of Alexandria.

The Cotton, Harleian and Sloane collections of the great English Library bear witness to the collecting activities of three English families. Sir Robert Cotton (1571-1631) made a specialty of collecting historical manuscripts and his son and his grandson continued in the same type of activity and presented the library to the nation in 1700. The Earl of Oxford, Robert Harley, 1661-1724, accumulated more than 6,000 manuscripts, 14,000 charters and 500 "rolls" which were greatly increased by his successor, the second Earl of Oxford (1689-1741). The manuscripts were acquired by the museum in 1753 for ten thousand pounds and it is safe to say that that amount could be obtained today for any one of a dozen of the original eight thousand manuscripts. Again in 1753 the Sir Hans Sloane collection of books and manuscripts was made available for

Children's room, New York City Public Library.

twenty thousand pounds and the three collections with the Royal Library became part of the British Museum, formally opened in 1759. The Royal Library received, beginning in 1662, a copy of every work published in the English possessions, and this right passed over to the British Museum. One Scotch, one Welsh, and one Irish library enjoy this free gift as does also University Library, Cambridge; however, only the British Museum has the space to take all publications issued in Great Britain.

A lottery scheme secured the considerable amount for expenses of the library and for the purchase of the Sloane and Harley collections mentioned above. Harvard College took also this dubious method of raising money for education in a lottery of 1753.

The British Museum possesses now more than three million books, reposing on some fifty-odd miles of shelves. When one enters the realm of millions ordinary counting offers difficulties. In a library shall prints and separate maps be counted? and music? and a hundred other questions arise to make an accurate count out of the question.

Among the many other notable English libraries the Bodleian ranks first and ranks high among the great libraries of the world. There are easily a score of libraries in England, Scotland, Wales, and Ireland which contain manuscript treasures worth a king's ransom. Ireland was early active in the copying of manuscripts and these products are even yet to be found in Irish and Scottish libraries.

On a par with the British Museum stands the Bibliothèque Nationale of Paris, possessing approximately three and one-half million volumes.

The French monarchs were more active collectors than the English, although some may question their peculiar methods of collecting. Charles the Eighth conquered Aragon, and, finding himself in Italy, brought home the wonderful library of the King of Aragon. In 1499 under Louis XII who succeeded Charles, the fine library of the Duke of Milan also became by conquest and seizure a part of the French Royal Library. Francis I acquired by confiscation about 1525 the books belonging to the Constable of Bourbon. Henry the Second made some amends, one might almost say, by pillaging the King's Library to satisfy the literary tastes of his favorite Diana of Poitiers. During the French Revolution the National Library was augmented by the books belonging to *emigrés,* by the books from church libraries and suppressed monasteries. The most energetic collector by seizure was Napoleon the Great and although many stolen books were returned yet far more were retained and are found today in the Bibliothèque Nationale.

In both London and Paris there are numerous public or semi-public libraries, including many special libraries along restricted lines, which contribute greatly to make London and Paris the two greatest literary centers of the world.

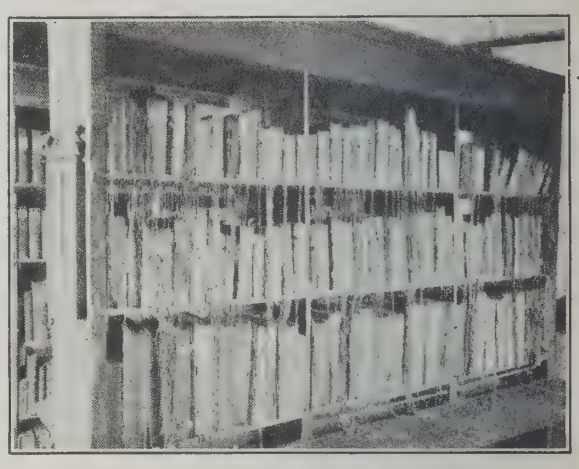
The British Museum and the Bibliothèque Nationale have for years issued many scholarly publications. The catalog of the British Museum in some fifty-two large folio volumes is an indispensable tool in every large library of America and England, and indeed of the world. The scholarly publications of the British and the French National libraries include many of the greatest achievements of modern scholarship. The British Museum in particular makes a practice of publishing at a moderate price volumes of popular interest concerned with treasures of the library. Recently the British Museum acquired the first printed map including the new world (1506) and published a large facsimile in a bound volume at a price of three shillings or 75 cents. Somewhat in contrast is the recent procedure of the Bibliothèque Nationale in allowing a private publisher to issue an earlier manuscript map, which is possibly associated with Columbus, at a price of 500 francs or $25, in a volume of about the same size as that issued by the British Museum at 75 cents.

The oldest of the large libraries is the Vatican Library which was founded by Pope Nicholas V whose term of office extended from 1447 to 1455. The building for the library was constructed under Sixtus the Fourth, elected in 1471, who appointed Bartholommeo Platina in 1475 as librarian. The energetic character of this librarian is indicated by the fact that the Pope was induced to issue a Papal Bull of excommunication against those borrowers from the Papal Library who did not return the books within forty days. History does not record any actual excommunication. Most of us cannot get our books back this way.

In this library the books were placed as in most early libraries flat upon desks or inclined shelves and were not placed vertically upon horizontal shelves. It is for this reason that the metal protection pieces were particularly necessary. Practically all of the larger volumes were chained to the desks where they could be used in place by a student sitting at a bench.

The later history of the Vatican is a story of the able efforts of numerous learned popes to make this library one of the great centers of the world's learning which indeed it is. Among the notable treasures is the fourth-century Codex Vaticanus, the whole Bible in Greek, which is possibly the oldest Bible in the world. Of the same century is the Codex Siniaticus, in Leningrad (and in parts in Leipzig), found by the Russian scholar Tischendorf in the monastery on Mount Sinai.

The Royal Library of Berlin while comparatively modern contains numerous manuscript rarities, including the original manuscript of Martin Luther's translation of the Bible. The Imperial Library at Vienna is famous as the repository of a remarkable collection of Oriental



Chained books, Hereford Cathedral Library.

Manuscripts, including many Egyptian papyri. A fifth-century manuscript of the Book of Genesis found there is wrought in gold and silver on royal purple parchment. Incidentally the fifth decade of Livy is found only in Vienna in a Scottish manuscript. Leningrad and Moscow have many treasures including wonderful special collections but hardly accessible now to scholars of the world. However, the Russian libraries are as yet intact and in some future happier day for Russia will again stimulate Russians to scholarly activities. In Belgium the library of Louvain, founded in 1625 by the historian Beyerlinck, was destroyed by the Germans. Many wonderful manuscript treasures were lost and numerous books of which there are no other copies known. However, a new library is arising, a tribute to the interest of the world and of America, in particular, to the continued spiritual welfare of the Belgians.

Where Are They, the Plainsmen?

Concluded from page 6

they found the missing parts of their instruments, or made new ones out of willow wood.

"A new head was provided for the drum from the skin of an antelope. This was easily done without firing a shot, as Custer always kept a pack of huge staghounds for the sport of running down wolves, antelopes and coyotes. Needless to say, the band was soon in full operation, sending the strains of martial music over the lonely hills of Montana, although the favorite air was 'The Girl I Left Behind Me'—probably due to many of Custer's men being raw recruits, some of whom hardly knew how to ride a horse.

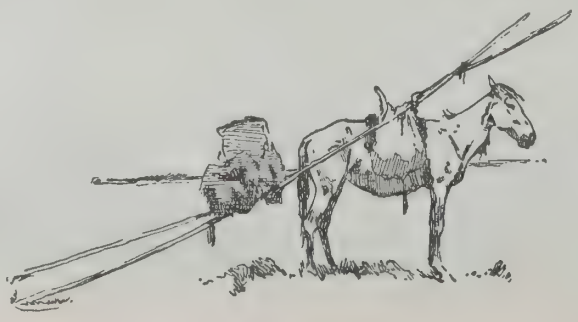
"Some time before the battle of the Little Big Horn," so Whitney told Kenyon, who could not remember just how long the packer said it was, "'Old Iron Bottom' swung onto his big iron-gray horse. The men knew what was coming. It meant hard riding and lots of it. Custer had a little Arab animal that he used on dress-up occasions and when the riding was light. But this time he rode the iron-gray; that meant business.

"On this trip, the General pulled off a deal that none of the troopers could understand: he led them at a fast gallop right through an Indian village. It was a small village—maybe some eight or ten lodges. The boys and men were all away on a hunting trip. The column moving fast, made it impossible for any of us to avoid riding down the women and children that were all about the place.

"Some of the boys had done considerable promiscuous shooting. How many of the Indians were killed or injured I could not tell. If 'Old Iron Bottom' thought he was going to cow them in that way, he surely made a mistake. A deal like that ground the sensitive pride of the Sioux and they were so infernally revengeful, they were sure to remember it and exact payment at the first opportunity.

"This they did on the Little Big Horn.

"We really knew nothing of Custer's part of the fight. From what some of the Indians told, he led his command to a low hill where the men were dismounted. The warriors rode around and around them, hanging onto the side of their ponies and, from this protection, shot the troopers down, one after another, the last few of whom were ridden down by the yelling Indians. One of the troopers, a man with long, dark hair and dark-brown mustache who had been very active in encouraging the new recruits, was seen to lead a few of them in a last desperate attempt to escape. But none got away. The revengeful Sioux collected their toll to the last man for riding down their undefended village a short time before."



Thus ended the battle of the Little Big Horn as told by old Whitney, chief-packer, who was there at the time. It was not a massacre at all, he told Kenyon. The Indians never asked for quarter, and seldom granted it. General Custer started the fight, apparently against orders.

The conclusion of this article will appear next week.

Traveling at Speed of 294,375 Miles a Second

Concluded from page 5

understood by saying that the fluctuations of the moon's mean motion, discovered by Newcomb in 1909, is an inequality in the lunar motion depending on the irregular refraction of the sun's gravitational wave action on the moon, at the time of the lunar eclipses. The sun's gravitational waves are irregularly *bent out of their courses in passing through the solid body of the earth;* the moon, thereby, is somewhat released from the sun's control, and tends to fly a tangent to its orbit, which gives rise to the fluctuations, recurring in periods of 18.02 years, 61.7 years, and 277.59 years, depending on eclipse cycles which have been known since the age of Greek supremacy.

The fact of the moon's fluctuations was suspected by Laplace about 1802, but only established by Newcomb in 1909, after laborious researches extending over more than 40 years. The cause of these fluctuations under this deflection of the sun's gravitational waves in passing through the earth, was discovered by me in 1916. It has also been recently discovered that the radio wave, *propagated in the ether,* near the earth's surface, is held back in its speed owing to the slower motion of the wave and of the ether in the solid earth. This causes the wave to bend about the globe, and renders its velocity only about 165,000 miles a second, in place of the 186,000-mile speed of light in free space.

This newly discovered fact accords with the explanation of the lunar fluctuations, and may prove to be the only discovery of an observed difference of velocity for a wave in the ether since Roemer's original discovery of the velocity of light in 1675. Thus, we find that light, radio waves, and magnetism travel in the all-pervading medium of the ether, and that, in reality, all the heavenly bodies are held to their orbits by cables of almost incomprehensible strength, but cables of the finest monatomic *gas.*

Mr. Murphy Becomes a King

Concluded from page 10

learned better than any other agriculturist the use and value of mechanical equipment in his industry. On virtually all the commercial potato farms, the plowing, sowing, cultivating, and harvesting is done almost entirely by machinery. In this industry also, the farmer has learned that his cultivators, planters, diggers, and, in fact, all his mechanical equipment must be adapted to the soil in his section, if he is to get the best results. Therefore, the making of potato-production machinery has become a localized industry to a very great extent, with the equipment designed and built to meet the conditions peculiar to each potato-growing locality. The potato farmer, too, begins to fight disease before he plants his potatoes, by dipping or fumigating the seed tubers prior to cutting them into pieces for planting. The crop is planted from January to July, according to the variety of potato and the time of ripening desired, with maturity a matter of 90 to 150 days, depending on climate, soil, and kind of tuber planted.

When King Murphy appears on his throne again next year at Stockton, he will be surrounded by a court composed of fair women and potato farmers from every potato-producing district in California, from the Mexican line to the Oregon boundary. Between this first Potato Day and the same celebration in 1925, an effort is to be made to have other potato-growing sections all over the United States hold simultaneous celebrations, so that the potato pageant shall become a national institution, permanently established.

"Lest This Country's Old Traditions Fail"

The Story of Those Who Won the Wilderness and Blazed the Trail

By GEORGE AVERY

WHEN one looks back over early American history, one sees something particularly striking in it. It is the spirit of freedom, that from the very beginning differentiates it from the history of countries settled by peoples with swords over their heads.

The history of America is an interesting story of the development of our institutions, and of incidents that have been stepping-stones in the progress of our people, and although it has developed fast, the past has not been forgotten. Many things and customs that seem shallow and without background reveal a traditional past.

America is rich in tradition, just like the whole is composed of the same material as its parts. Alas, Americans know little enough about their historical background and traditions. Every American should at least be acquainted with the early tales in our history to see how the roots of the present lie deep in the past, and every father should pass on the old traditions to his sons as they sit together by the fireside on the long winter evenings.

One of the first tales of interest in our history is that of the lost colony of Roanoke Island. The island is still to be found in the Roanoke River near its outlet into the sea in North Carolina. The colony was fathered by Sir Walter Raleigh, who first sent out investigating expeditions from England and later, in May, 1587, prepared to plant a permanent colony. The commander was to be John White. When the little group of colonists arrived at Roanoke, the hired ship captain put their effects on shore and sailed away with two of the ships, instead of taking them to their proper destination.

A Sign That Failed

THE island was inaccessible and its soil was poor. The colonists soon became discouraged and urged White to return to England for supplies. He left in the one ship at the disposal of the colony and unfortunately was forced to remain in the country nearly four years. When he returned to Roanoke in 1591 in a hired ship, the island was deserted and the fort was in ruins. The only evidence of the fate of the colonists was the word "Croatoan" carved in the bark of a tree. It was the name of a tribe of Indians not far distant. Before White's departure it was agreed that if the colonists removed, the name of their refuge would be carved on a tree, and if harm had befallen them, that a cross would be added. As no cross appeared, he planned to search for them, but the captain feared storms and would not wait, so they sailed back to England. Later efforts of Raleigh to find them proved futile and they were never seen again by white men. The settlers at Jamestown, planted 20 years later, learned from the Indians that the people went to the Indians but were later massacred through the influence of Powhatan.

Since that first attempted settlement on Roanoke Island, America has been making history, interesting history. Far more interesting and romantic than any novel. It is not a history of kings, but a history of a great people who came to America because they believed in a principle that an autocracy would not tolerate. For this principle they left their comfortable homes in a civilized country and came to a wilderness. True, this great undeveloped wilderness with its uncut forests, its unfished streams, and its generally fertile soil, was more of a good thing than the early settlers thought, because they had hard times, starving times; despite the natural resources that were here for the taking. For the first few winters after the settlement at Jamestown in 1607, the food supply ran short and the ravages of disease thinned the ranks. The newcomers did not realize that the forests had to be cleared away to raise enough food to take care of the colony in time of need.

They were in a daze and thought God would take care of them, which He did, through John Smith, who showed spirit and proved himself a man of force and energy. He went into the wilderness of which he knew nothing, made friends with the Indians and procured food to pull the colony through the winter. John Smith was one of the first men in our history that typified what later became real American character. He set a precedent for those soon to follow and it was their spirit of adventure and fidelity of purpose that gained them a country; the country whose liberty, equality and justice we enjoy today.

The settlement at Jamestown was followed in 1620 by one at Plymouth. It was at that time that nonconformists were being persecuted in England and ministers took their congregations to Holland (the land of exiles even in that day) where they set up churches and found work. But after a few years they found their condition unimproved, and their children were becoming Dutch in speech and ideas. They longed for a home in a country of their own and America seemed to be the promised land. After many delays in making the arrangements, the Pilgrims, 102 in number, finally set sail in a hired ship, the *Mayflower,* for, as they thought, Virginia. Land was sighted three months later at Cape Cod, and they turned south along the coast, but the captain refused to continue his journey southward, alleging the dangers of the sea. After five weeks of exploration, they took the ship to Plymouth, a place marked on Captain John Smith's map. It had a good harbor, good drinking water, and a few old fields where the Indians had cultivated crops years before. It was here that they landed in the middle of a long hard winter. Hunger, cold and illness played their parts relentlessly, and by the arrival of spring scarcely 50 of the colonists were alive. But the spirit of the survivors did not fag. Fish and game were abundant but they had to serve their time on short rations, because they were agriculturalists and had not learned to take them. In Massachusetts, as in Virginia, it took time to develop the keen resourcefulness of the American frontiersman.

An Early Dissenter

LATER came the Massachusetts Bay Colony. Its founders were not separatists from the church as were the Pilgrims, but were Puritans, who wished to remain in the established church, although they sought to reform its doctrines. They founded Boston at the mouth of the Charles River in June, 1630, and like the others, they had their hard times. Something of a different nature was destined to crop out in the Massachusetts settlement. It was the spirit of the dissenter and came to light in one Roger Williams who was the first to openly preach the separation of church and state. This doctrine alarmed the authorities to the extent that Williams was banished. The decree came late in the autumn of 1635 and as winter was approaching he was permitted to remain until spring with the understanding that he did not preach his tenets. When it was known in January that he was not doing as instructed, preparations were made to send him back to England. Learning of this he escaped across the snows to the Narragansett Indians, who received him kindly. It was here outside of Massachussetts that he planted the settlement of Providence, later in Rhode Island, which was destined to be the genuine home of tolerance and was to play a more important part in our history than its size warranted.

Jamestown, Plymouth, Massachusetts Bay and Rhode Island are typical of the early settlements in America. Similar settlements took place until the Atlantic Coast was dotted with them. But those early settlers were eager and ambitious. They had a desire to push into the interior and thus came the westward movement; an inevitable result of the indomitable spirit of our ancestors would not let natural barriers stand in their way. They cut trails through the forest and crossed the mountains into the Wyoming Valley of Pennsylvania; forever pushing on. Between the early period and that of westward expansion, they had learned to understand the language of the rivers and the forest and they longed to be alone with them. This was a good thing for those early peoples because it gave them a chance to think for themselves and thus cultivated into them real Americanism.

It was in this early period that certain customs which we hold as traditional were formed, as the celebration of Thanksgiving Day. In 1623, more than four hundred years ago, drought threatened to destroy the crop, and a day of humiliation and prayer was observed; after which came a copious rain and saved the harvest. In gratitude a day of Thanksgiving was set apart for autumn, and lest the old traditions fail, we still observe that day.

The Revolution and After

THEN came that period in our history leading up to and including the Revolution, when Benjamin Franklin said the colonies would not desire independence if they were fairly treated. But the mother country did not understand, and fair treatment seemed to be enforcement of the Navigation Acts; the placing of a British Army in America; the Stamp Act, and similar outrages that could not be interpreted as favorable by the colonies, so after the "Boston Tea Party," Bunker-hill, and the capture of Fort Ticonderoga "in the name of Jehovah and the Continental Congress"; and the supreme step was taken and independence was declared. The famous declaration, chiefly the work of Jefferson, was formally adopted July 4, 1776, and marks the time when America started on her road. The Revolution was a test whether or not the common struggle to conquer the wilderness had knitted a people together. There were but few who did not prove themselves true to the new colors, and it was at this time that they became real Americans, and men like Washington, Hamilton and Jefferson came to the front, to again set an example for those to follow, as their forefathers had set an example for them. The tales of what they did in the years during and shortly following the Revolution have oft been repeated; Washington as Commander-in-Chief of the Army, later as President, and how in his farewell address he warned the young America against entangling alliances, and other things that might befall her path, just as a father would warn his children; of the financial policy of Hamilton; and the individualism preached by Jefferson.

The period following the war was a hard one for America. She had always been dependent on someone else, but it was up to her to form a government of her own with all of its necessarily complicated functions. The first attempt was the "Articles of Confederation," which lasted only a few years because they gave the power to the states and thus provided for only a loose confederation. It was soon seen by thinking men that they were inadequate, but there were those who had to be convinced. It was not many years, however, before the country in general was for stronger union. The Constitution was drafted in answer to this, and was adopted in 1789.

So it was that early America started. She was continually confronted with new problems, always solving them in what turned out to be the best way. Where her pride was at stake and her privileges as a nation were being abused, as was the case early in the nineteenth century, she took the extreme step. It was the War of 1812, which, although costly in national humiliation, taught the American people to take seriously its function of national defense, and thus made the tie of a strong central government more binding.

Thus it is through the storms of time that America has been handed down to us. It is ours, it belongs to every one of us. We should be a very grateful people for the many things that God has blessed us with for they are the result of what those sturdy pioneers strove for, yet hardly dared to hope for. Their ever-present vim, vigor, vitality and foresight made America what it now is, a nation among nations.

In our common glory as Americans, let us keep our background in mind that we may be grateful, hopeful, and helpful, both to our government and to one another. Let us each cherish the ideals, beliefs, and spirit of our fathers, build with reverent hands to a greater republic, lest the old traditions fail.

What Is the Condition of Our Navy?

(Concluded from page 13)

We are behind in our ratio as to personnel. The standing by percentage is as follows:

	U. S.	Brit. Emp.	Jap. Emp.
Officers, regular	3.38	3.60	3.00
Enlisted men, regular	3.94	4.28	3.00

This shows that Japan has her full quota, the British Empire is considerably behind its quota, and the United States is still further behind its quota.

What about aircraft? Are the "old fogies" in the navy preventing the development of aircraft? Is the battleship really obsolete?

Make no mistake, the navy has—and always has had—an aircraft program and policy. Indefinite charges about the "old fogies" in the navy have been greatly overworked.

When the Wright brothers made their first flight at Fort Myer, Virginia, two naval officers—who have since risen to high rank—stood watching, and when the Wrights made that short but successful little flight, one officer turned to the other and said: "The navy must get busy on this thing." The navy has been busy ever since, and in a much more intelligent manner than has Congress. Curiously enough, one of the naval officers, just referred to, is one who is frequently characterized as an "old fogey"!

Remember this, since 1914 the Navy Board has been asking of Congress every penny for aviation that it was thought it could get, and usually it has asked for much more than Congress saw fit to appropriate.

Remember this also, since 1908 these "old fogies" have been teaching flying at Annapolis. It is but fair to say that these "old fogies" seem to have been awake long before most of our 110,000,000 Americans. That's their business.

The position aircraft takes in the navy would require too much space to explain, but, briefly, *aircraft is not considered the most important unit in the navy.* Naval officers are not the only ones who contend that the battleship is the backbone of the fleet. The Arms Conference recognized that fact and the Treaty was framed along those lines.

The position of the naval officer is: until something is proved to be of more value and importance, do not discard the battleship.

Major General Patrick, chief of the Army Air Service, recently testified before the House Aircraft Investigating Committee that *the attacks on the battleship Washington demonstrated that our present type of bombing planes would not destroy a battleship, and that our attack planes are still in the experimental stage,* and that they will have to be developed to carry more powerful bombs. This should be a sufficient answer to those who claim the airship has replaced the battleship. Our navy must deal in facts, not in speculative theory.

Naval officers have accurate data and information as to what all known types of aircraft will do. They consider aircraft as an important unit of the fleet, just as is the submarine and the destroyer, but only an auxiliary. The navy recognizes the fact that we need scouting, fighting, bombing, and observation planes, and that a preponderance of such auxiliaries might turn the tide of battle.

But, bear this in mind: a lighter-than-air ship, *twice the size of the Shenandoah*—and such a one has not yet been built—*could carry only 25 short tons of weight.* The cruising radius of aircraft is not sufficient at present to carry any great amount of ammunition and be a fighting factor any distance at sea.

It is true that at present our navy is below our Treaty allowance. Navy officers are not to blame for that, but those who govern and control appropriations. However, it is also true that the Arms Conference has made it impossible for us to reach a really 5-5-3 basis until we commence—about a decade hence—to replace some of our old ships with new, as provided in the Treaty. For ten years or more we must be below par, navally speaking.

If we are fortunate enough to avoid war in the meantime, well and good.

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Ginseng is supposed by the Chinese to possess peculiar curative qualities, but reputable physicians of this country do not consider it of much value. Consequently the entire output of ginseng in this country is exported to China.

It is said that Boston passed an ordinance which forbade bathing unless by the order of a physician, and that this law was actually in the code from 1845 to 1862.

Japanese hyacinths which now infest the Laguna de Bay and other waterways in the Philippines constitute a menace to navigation, and within a few years, unless they are exterminated, navigation in the Bay and the Pasig River will be impossible.

Archeologists are excavating the ancient Roman city of Leptis Magna, buried beneath the sands of the Libyan Desert in Northern Africa. No other buried city so far discovered has been found so intact, with the exception of Pompeii; and Pompeii, while yielding magnificent statuary, cannot boast of such architectural splendor as found at Leptis Magna.

The Cornish of Great Britain are a race apart from others. They are formed of a union of the primitive tribes and the Brythonic race, which gave its name to Britain. They still speak of "going to England," as if it were a foreign country.

The Palaungs are a people dwelling in Burma. The Palaung child is taught never to go under a ladder, because the influence of the person upon the ladder—or that of the last person who climbed it—may descend upon the person underneath.

In the church at Mullion Town, Cornwall, a thoughtful medieval ecclesiastic provided a devil's door near the font, through which the devil may escape when the sponsors renounce him and all his works.

Wild geese cast their feathers in summer, losing almost all the feathers from their wings simultaneously. During this season they are helpless and the natives of Northern Russia take advantage of their condition and net them by the thousands. These are buried in the mud of the swamps and left to rot. Later they are dug up and fed to the half-wild dogs and are even eaten by the undiscriminating native.

The original of the glass known as a "tumbler" was a drinking vessel with a bottom so constructed that it would not stand upon a table. The "tumbler" was a product of the old days and was designed to make a man "take off his liquor" without setting the "tumbler" aside.

The tax collector never visits the Scilly Isles, off the southwest coast of England near Land's End.

From the good you will learn good; if you mix with the bad you will lose what sense you have. When you undertake great affairs, confide in but few.—Maxims of Theognis, the Greek poet of the sixth century B. C.

Ten American states have among them more telephones than all foreign countries combined.

Makers of violin bows are becoming anxious over the growing scarcity of white horses, from the tails of which are taken the hairs for the bowstrings. The best supplies come from Siberia and East Russia.

Closeness of weave rather than thickness controls blanket warmth.

"Speak! Speak! Thou fearful guest—" A skeleton in ancient Spanish armor was found under a rock 18 miles south of La Junta, Colorado, recently by several boys. Historians believe it to be a member of a band that traversed that part of the country under the leadership of the Don Vasquez Coronado. The armor plate is covered with ivory. On it are figures believed to be Roman numerals. Parts of a copper gun stock and an ancient flintlock blunderbus were also found nearby.

Each Lord Mayor spends something like $75,000 out of his own money for the honor of being London's chief magistrate.

Hunting for mammoth ivory in the northernmost parts of Siberia is a regular business and in the past century the yield has been estimated at from twenty to thirty tons.

In India alone more than ten million people have perished by bubonic plague since 1896.

"The teacher's greatest field of usefulness is in making children think. Make them think rather than make them good. Once they learn to think they are naturally good. Children must be taught to do right because they want to, not because they have to. The second greatest mistake parents and teachers make is preparing the path of life for the child instead of preparing the child for the path of life."—*Judge Ben Lindsey.*

The first issue of postage stamps in the United States was in 1849, the year of the great rush to the California goldfields.

Wiggs are flat, round buns, eaten on St. Catherine's Day in those districts of Buckinghamshire where wood turnery is carried on. The wigg represents the wheel on which St. Catherine was martyred.

The saying, "Let loose the dogs of war," once had a meaning. In the Middle Ages dogs were sent out toward the cavalry of the enemy with kettles of burning resin on their backs, the odor, smoke and flame of which naturally excited the horses. A stout jacket of leather underneath the kettle protected the dogs in case the hot resin was spilled.

Chop suey can be obtained in every modern city of the world save Canton and other purely Chinese cities.

Gertrude Atherton, author, is a great-grandniece of Benjamin Franklin.

"I Read in the Papers—"

I READ IN THE PAPERS several obituaries of Samuel Gompers, but not one that told me that he was born a Jew. Newspapers seem to be skittish of such facts. Yet one newspaper, that "skipped" this biographical item, printed on the same day a list of Jews who had distinguished themselves in 1924, among the names being Benny Leonard, Aaron Sapiro, most of the motion picture owners, and Ben Hecht. A newspaper can do this, it seems, when a Jewish source asks or permits. But if the same newspaper were to say (I quote from the list) that Samuel Shipman, playwright, was a Jew; that Leo S. Rowe, Director General of the Pan-American Union, was a Jew; that Eugene Meyer, Jr., head of the United States War Finance Corporation, was a Jew; that Franklin P. Adams, famous columnist, was a Jew—that newspaper would be accused of "anti-Semitism." It is, however, a big "if"—the newspaper simply wouldn't do it. And it knows why. To that extent it does not give "all the news that's fit to print."

I READ IN THE PAPERS that Ban Johnson has been "shorn of his power"—that is the way the thing is described. It is not surprising. Big Ban has been too hot after the grafters. He has been too jealous for the honor of baseball. He has regarded the game as a sport rather than as a commercial proposition. It was ostensibly to plaster on some respectability that Judge Landis was appointed to be Czar of Baseball, but our opinion is that Ban Johnson was the greater source of respectability. What is now apparent is this: Ban Johnson did not please the owners of Baseball; Judge Landis did. A different tale would be told if it came to report on which of these men pleases the fans. However, all these things must come to pass before a wrong course ceases. Silencing the prophets who expose corruption and demand judgment is one of the surest signs of decadence.

I READ IN THE PAPERS months ago whole pages about an investigation into the lease of Teapot Dome, and at last I read—some time ago—that the case was being tried in California. What happened out there? Apparently the newspapers do not know, or are not interested, or believe their readers are not interested. This is one of the typical practices of American newspapers—they chase fires and suicides and divorces and leave the important news hanging in the air. Thereby they belie themselves and perhaps belie the character of the American public. They belie themselves in having told us that the Teapot Dome exposure was the most important matter on which the American mind could concentrate—and then they drop it. They belie the American public by working it up almost to a lynching fever upon *ex parte* statements, and then assume that the American public does not want the sober truth, soberly sought and determined. Now the question is, Does this procedure represent the American mind or the Newspaper mind? Probably not the American mind, for in these matters it is showing a decided tendency to diverge from the Newspaper mind. Why cannot the newspapers have a daily department of "Unfinished Business" in which to give brief details of the present status of matters to which they have commanded our attention?

I READ IN THE PAPERS, and elsewhere, enough to justify the conclusion that modern cleverness consists in ridiculing other people's sacred things. Marriage, of course, long since was dragged down the steep descent of sacrilege. Cleverness has not yet put it over on Death—it is still afraid of Death, horribly afraid, hysterically covering it up with all sorts of strained jocularities and artificial dramatics. Even Edgar Lee Masters, who sometimes shows flashes of being a poet, winds up a sarcastic sentence with the mock formula—"Let us pray." Huneker's letters, recently published, puts that clever man in the small-boy class whose delight is in scribbled obscenity. The pity is not that these men go through a phase (a phase through which all pass, perhaps) but that they are arrested in it, they don't grow out of it. That is the damnation of these men; and it is all the hell that anyone would want—just to be chained to clever nastiness. These are not matters for editorial opinion nor for court action, they are clinical cases, and they call for the specialist in nervous diseases.

I READ IN THE PAPERS that the Pope, with curious ceremony, broke down the Holy Door, an act which is performed once every quarter of a century. But with the usual lapse, the newspapers did not give me the "why" of it. If important enough to print, it is important enough to explain. However, the newspapers may not be entirely to blame in this instance. I spent half an hour with the Catholic Encyclopedia trying to trace the matter, but found not even a reference to it, until consulting *Columbia,* the official organ of the Knights of Columbus, I discovered the true title of "Jubilee," and so arrived at the desired information. The custom appears to be a Christian adaptation of the Mosaic year of Jubilee which occurred every fifty years, when slaves were freed, lands returned to their original families, debts canceled, and society started out with a clean slate again. The popes variously decreed the Christian observance to be held every century, or every half-century, until now the observance is definitely fixed for every 25 years, beginning on Christmas Eve. It is theologically described as a means of return to faith, and special indulgence is given to those who visit and observe certain duties at four designated churches in Rome. Foreigners are required to reside at Rome for ten days in order to avail themselves of the indulgence. The ceremony of breaking down the door is symbolic of a new door of grace being opened up for the faithful.

By the Year $1.50 | Published Weekly | Dearborn, Michigan, January 17, 1925 | 25th YEAR No. 13 | Single Copy Ten Cents

MR. FORD'S Page this week discusses Courts and Judges. Though few of us ever have business with one or contact with the other, we are all inevitably affected by them, and it is well occasionally to give them a place in our reflections.

FOR months I have been reading everything that has appeared about the Spanish Directory, as Spain's dictatorship is called, but the clearest view I have ever had, and the most consistent and impartial information, I found in the article on page 13 of this issue. After reading this you will be able to see something new in dictatorships. The Spanish style seems to have been invented to save the throne, not the people, and now the difficulty is in letting go. They fear that, having given a boost to what Spain has never had before, namely, public opinion, the people may demand their innings when the Directory tries to slide into private life again.

THE Jews are a perennial topic of interest and the world gains nothing by hush-hushing it up. Intelligent Jews agree with this and favor frank discussion as a means of dissipating prejudice and getting down to basic facts. From time to time we hear of Anti-Semitism in Germany. Did it really exist? If so, what was its nature? What was its alleged justification? It is part of the business of "an international weekly" to give its readers the facts as fairly and fully as they can be gathered. So on page 2 you will find light on the question.

THIS is a kind of round-the-world issue of THE DEARBORN INDEPENDENT, which is perfectly natural in "an international weekly." Here on page 4 is "Jerusalem in a Snowstorm," by a man who was there when it snowed. Anything about Jerusalem is interesting, but snow is positively sensational. It renders our frosted Christmas cards true to life. Gilbert K. Chesterton told me that the Christmas he was at Bethlehem it snowed, and it made him glad, for then he knew that all the snowy Bethlehem Christmas cards were true.

ON PAGE 12 is a story on Europe in general—an American view of what is wrong. No politics in this article. Mr. Pinci left America where workingmen by millions own motor cars, and traveled through Europe where no workingman owns a car-and by simply following the motor car clue, he arrived at cer, tain discoveries. What ails Europe is the inability of its leaders to see that no country rises higher than the level of its people. Until Europe's workmen are enabled to buy what they make, there will be no healing of the present distress. On page 10 Paul Tyner gives a quick, vivid view of England, her new policies and the new Fascisti—the party of youth. Well worth reading.

THE America that is passing is preserved in two lifelike descriptive articles in this issue: "When the Cold Springs Stage Was Robbed" (page 11) and "Natchez-Under-the-Hill's Lurid History" (page 3). To get the full swing of the first article, turn to last week's issue, page 6, "Where Are They, the Plainsmen?" These are authentic first-hand descriptions of early frontier life by the last of the plainsmen. The Natchez-Under-the-Hill story paints a phase of life once common on the Mississippi, but now happily passing away. Mr. Barnet is just naturally able to capture and communicate the various and subtle atmospheres of the South.

THE white man gets all the blame because he does all the work. Whatever his mistakes in governmental policy, they are usually made in obtaining some benefit for others. The American service to the Philippine people is something to make the American proud, although he sometimes has occasion to question his kindness when he sees how it is misrepresented by its recipients. However, on page 9 there is an article by a man who would rip away all American cant from the Philippines, if there were any to rip—and you can judge for yourself whether America has fulfilled again her destined role of Servant of the World. "The chiefest is the servant of all."

Anti-Semites in Germany!—Where and Why?

A Straight Display of Facts Concerning Jewish Influence in German Life

By WALTER M. WOLFF

WHEN the one-thirtieth part of a nation of sixty million persons is found to be of Semitic descent, we are inclined to believe that there is little or no occasion for anti-Semitists of that nation to beat the tom-tom and shout in accents wild that a terrible menace of calamity is sweeping over the land, devouring everything through its powerful, devastating influence. But, when we consider that this selfsame one-thirtieth of the German population actually controls and shapes the destiny of the country involved, the situation assumes an entirely different aspect.

The estimated Jewish population of the German Republic at the present time is, in round numbers, *two million.* Twenty-five years ago there were scarcely *one-half million* Jews in a German Reich which was then much larger than it is today. A tremendous influx of Semites from Poland, Galicia, and Russia, during and subsequent to the late war, has given new Germany a Jewish population that is now a far greater influence on the welfare of the German people than is generally supposed or appreciated. The Jews have so well succeeded in securing a hold on the destinies of Germany not only through wholesale immigration but by means of intermarriage and conversion to Christianity as well, that they are now an integral part of the German nation itself. Because of these various forms which Jewry takes, no official or unofficial German census has yet been able accurately to show the exact number of Jewish persons residing in the country. The statement "Once a Jew always a Jew" is borne out by the German-Jewish Professor Gans who says: "Baptism and even intermarriage matter nothing. We shall remain Jews unto the hundredth generation—Jews as we were 3,000 years ago. We shall never lose the smell of our race; no, not even through tenfold intermarriage! *Our race shall dominate until the end of time, do what you will!* The result of marriage—or no marriage—will ever be *young Jews!*"

No Increase of Jewish Workers

IN THE light of recently compiled statistics, we Germans find ourselves face to face with a goodly bit of "eye-opening" information with respect to conditions prevailing on the Central European continent. In postwar Austria, for example, the increase in the number of Jews is little short of appalling. In Vienna alone there are today 600,000 Jews! In 1914 there were but 175,000. Six hundred thousand Jews in the Austrian capital means that *every third person in Vienna is a Jew!* Is it any wonder, then, that in Vienna the direst poverty and the most lavish pomp live side by side, immediate neighbors to each other? In all this vast Semitic horde in "gay" Vienna there are few or no workmen. It has not been the workingman who has made Vienna notorious throughout Europe during recent years as the mecca for profiteers, manipulators, and swindlers of every description. And who will deny that on account of these parasites the Austrian people were forced to pawn their last bit of national property to the Entente nations, and were compelled to surrender their civil rights and sovereignty that Judah might flourish?

There would indeed be no serious grounds for complaint from the German people with regard to the Semitic element if the coming of the Jews into Germany represented a valuable increase of the working class. The Germans might then go so far as to ignore entirely the race problem in the premises. But the Jews are not by any means only a race, a historic people, or the exponents of an ancient religion; they are in addition to each of these what we may well term a class of born professionalists. Wherever we find the Jew, by some manner of means, he is invariably trying for complete *control* of affairs in an incredibly short time; he is, in almost every instance, the profit-taking, rather than the constructive element. The German Jew, like his blood relation the world over, is a professionalist, not a workman. Thus he adds to the burden of Germany; he does not help to lift it.

Startling Comparisons of Jews and Germans

IN A great majority of the trades in Germany the Israelite is found either as the proprietor or the directing influence behind the enterprise. Very few German Jews there are who profess to be plumbers, or carpenters, or shoemakers, and there are very few bakers, butchers, and street car conductors among them. In the heavy industries—that is, as iron workers, foundrymen, machinists, firemen, and the like, the Jew is practically a nonentity. In commercial enterprises, however, the story is a very different one. *Of each 1,000 Germans* to the population *only 28 are to be found engaged strictly in business activities;* out *of every 1,000 German Jews, 245 are actively engaged in some sort of commercial endeavor.* In five of the great German industrial centers we find the following proportions, the figures representing the number of Germans and Jews to the 1,000 of the entire population:

	Engaged in Industry		Engaged in Commerce	
	Germans	Jews	Germans	Jews
Plauen	72	19	16	78
Duisburg	67	22	21	67
Bochum	71	22	15	64
Gelsenkirchen	78	24	11	66
Dortmund	65	23	22	63

Thus nearly 40 per cent of Jews go into commerce, as against less than 9 per cent of Germans, while 10 per cent of Jews enter commerce as against 35 per cent of Germans.

While, therefore, the Germans are to be found in the creative lines of labor, the Jews have taken unto themselves the control of the nation's trade pursuits; and while, on the one hand, the German workman continues to toil for a scanty reward in the great industrial beehives the Jewish alien in his very midst is constantly at work preparing new stock market maneuvers, manipulation of commodity prices, and other tricks of finance whereby profits which run well into the six ciphers are realized.

Statistics in Germany show that the Jew, wherever possible, believes in withdrawing early from the cares and worries of an active life.

There are, for instance, fifty-four Jews in Germany who profess to be their own bosses as against only twenty-eight Germans.

Seven Jews enjoy financial independence to every three Germans!

The Housing Situation Is Affected

THE opulence of the German Jew is also emphasized in the housing accommodations enjoyed by the former.

While there are eight Germans or non-Jews possessing one-room apartments, only three Jews occupy the same amount of space. The large, luxurious living quarters, however, belong almost entirely to the Jew.

Five and seven room apartments are owned by 52 Jews out of every 100, while but 12 non-Jews are in a position to afford accommodations of this size.

In the field of higher education, also, the German Jew is far in advance of the native German. Only 25 Germans out of every 100 of the population are able to send their sons and daughters to higher institutions of learning; but 80 Jews can afford the same advantages to their offspring! In the University of Vienna, for example, the following notable comparison is brought to light. During the years 1913-14, seventy-one Austro-Germans and non-Jews against but thirty Jews were in attendance at the aforementioned school; in 1914-15 the proportion had changed as 55 to 45. But in the year 1918 there were only *eight* non-Jews for every *ninety-two* Jews registered at the Vienna institution of learning—92 per cent Jews against 8 per cent Christian.

The following authoritative statistics may give a clear conception of the actual school attendance in Germany of German and Jewish children:

Out of 100 Children	Germans	Jews
attending the public schools	93	42
attending the high schools	5	26
attending the universities	4	33

This evident mass education among the Jews has resulted in the passing of the arts and sciences entirely into their hands (or heads). The Jews prefer above all among the professions those of doctor of medicine and lawyer. For every 1,000 Germans there is but *one* physician and surgeon in the Fatherland, but there are *eight* Jewish doctors for every 1,000 Jews.

Most of the medical men in foreign countries who style themselves "Germans" are in reality Jews.

As far back as 1912 there were 752 "German" doctors of medicine practicing in the United States, but actually *612* of these were of Jewish descent!

Germany in Grip of Jewish Finance

THERE are 43 Jewish attorneys in Germany for every German lawyer. Small wonder, then, that Germany has particularly severe difficulties untangling her economic and financial affairs since the World Conflict, in view of the overwhelming interference and influence of the perspicacious Jew.

The control of German finances today lies absolutely in the hands of the German Jew. There are *24 Jews* to every native-born German on the boards of directors of German commercial enterprises. With the exception of a few independent, co-operative banking institutions in Germany, *the banking system is dominated absolutely by the Jews.*

We have only to consider the present Reichsbank which was not originally established by the state but is a private enterprise operated under the direction of the Minister of the Treasury because it administers the national funds. The German Reichsbank was founded in 1874 by fifteen persons, *eleven of whom were Jews*—namely, Siegfried Berend, A. Meyer, Bleichroeder, Gelpke, Mendelsohn, Oppenheim, Plaut, Rothschild, Stern, Warschauer and Zwicker. Perhaps it is easier to see now why the native German finds it so hard to obtain credit from the Jewish-controlled banks except at sky-high interest rates, and is forced to seek loans in foreign countries while the Semitic merchant, on the other hand, can obtain all the ready cash he wants.

Under prominent German Jews in the realm of Teuton finances are to be found such names as the following: Salomon von Oppenheim, Loewy, Schlesinger, Jacob Michael, the present "King of the Bourse," Loeb, Guttmann, Guldschinsky, Warburg, Ballin, Wertheim, Tietz, Salomonsohn, and so forth. Last, but by no means least, we must not forget to mention Rothschild whose enormous wealth makes the accumulations of venerable old German families such as the Krupps appear like the contents of a child's savings bank in comparison.

Among the banks which are to take over the shares of the new Bank for German Industrial Bonds, established under the Dawes Plan as an institution which shall guarantee the security behind the German gold loan, we find such names as S. Bleichroeder, Delbrueck, Schickler & Company, J. Dreyfus & Company, H. Mendelsohn & Company, E. Heimann, Gebrueder Arnhold, Bank-Verein Hinsberg, Simon Hirschland, Menny Oppenheimer, Lazard-Speyer-Ellissen, M. M. Warburg & Company, Straus & Company, A. Levy, Salomon Oppenheim, Jr. & Cie, and so on down the long list. Many German banking institutions do not have personal names such as the foregoing but employ names similar to our banking bodies: as for example, Deutsche Girozentrale, Reichs-Kredit-Gesellschaft, and so on. How many Jews are affiliated with the latter class of organizations is not known, but we may safely say that the Semitic element is predominant here as elsewhere, particularly where, as we have just observed, the name betrays the race and the individual.

There are *ten* Jewish journalists and authors in the Reich for each German engaged in these professions. Also the majority of the prominent German publishing houses are under Jewish jurisdiction, as are most of the advertising concerns throughout Germany. The Jews themselves assert that they are but one per cent of the entire population in Germany, but they make no mention of the fact that they exercise a *38-fold potentiality* upon the intellectual pursuits of the people under (or over) whom they dwell as an alien race. German poets and literary workers are forced aside to make room for the callow Jewish youths whose literary trash is being forced more and more to the front in German schools and on the German stage.

We can now better understand that after disclosures such as the foregoing, enlightened Germans are throwing up their arms in dismay at the encroachment of not only an alien race but of a serious menace to all German institutions as well.

The Profiteering and Housing Problems

WE MIGHT go on indefinitely citing statistics and evidences to show the extent of the Jewish grip on Germany and the German people. We find that in the art of profiteering, swindling, and other forms of illegal manipulation, the German Jew excels all records for keen activity. During the recent years of the inflation period there were *seventeen* times as many Jews found guilty of profiteering as Germans!

At the present time there is, of course, no outward anti-Semitic feeling such as was manifested during the days of the food shortage and currency inflation two years ago. At that time there were frequent demonstrations and near-pogroms against Jewish shopkeepers in Berlin and also against the wealthy Jews who occupy almost all of the lavish six and eight room apartments on Berlin's famous "Kurfuerstendamm." Today, however, the average German is content if he has but sufficient to eat and, in addition, a stable currency something near to that which he enjoyed before the war. Although he scarcely realizes that he is being led about like a chained beast by the aliens in his midst, he does feel that the Semites are in control of the affairs of his country in more ways than one. *But* he also knows that he is powerless to prevent what is going on, and he lets it go at that. Meanwhile the German press at large is careful to see that little anti-Semitic propaganda gets to the surface, which is hardly to be wondered at in view of the fact that the Jews run the press, as we have already observed.

Rational, far-sighted Germans are not for solving the Jewish problem by means of inimical moves motivated by envy and jealousy. Far from anything akin to this. However, they fully appreciate the great task which lies before. They believe that in going after the problem in a sane, businesslike manner they can best accomplish their chief aim which is simply that of keeping Germany for Germans. The hypothesis is that to maintain a thoroughbred German nation, a foreign body or influence—and such is the Jew; who will deny it?—must be treated as such and accorded the rights and privileges of an alien element within the republic. In other words, the Jew should be subject to the same identical laws and regulations as any other foreigner.

Who Are the Victims—Germans or Jews?

IN BAVARIA an investigation has long been under way to determine the actual number of Jews in public service throughout the state. The Bavarians are also preparing a law which will prevent a Jew from changing his family name as has been his custom in the past in many instances, thus preventing altogether an accurate check on the activities of the Jew in Germany.

In conclusion, then, we may say that the German in no way begrudges the Jew his God-given right to expansion and development, be it intellectually, financially, or otherwise. However, the German does see a very real and serious menace to the ideals and freedom of his native land if the Jew is not placed where he belongs. As one influential German with true prophetic acumen so wisely declares:

"The Jewish problem is the gateway through which we shall of sheer necessity have to pass sooner or later, because right and left of us yawns the abyss over the brink of which will otherwise slowly but surely disappear all that was once wont to call itself German."

Whether or not the world knows it or believes it, the people of Germany are merely the pawns on the vast chessboard of the Jewish money game. And whether the world wishes to believe it or no, this vast Jewish chessboard extends to the nethermost parts of the civilized world. There is a mighty host of "pawns" wherever there are Jews.

Natchez-Under-the-Hill's Lurid History

Mississippi Devouring Town Where of Old Hectic Scenes Were Staged

By HARRY E. BARNET

HOW are the venerable landmarks of the South coming on? Quite poorly, some of them. Quite poorly. Natchez-Under-the-Hill, for instance. In the days of its age, it's the cowering remnant of a place that once extended 2,500 feet from the base of romantic bluffs into the Mississippi River.

But its soil was soft. No rocks in it. Fit subject for a sermon. And an easy morsel for the gluttonous river. Here it picked a piece out of the place; there, a piece. The river did this through a hundred years, until it wore the locality down to a narrow strip of land, upholding the huddle of buildings.

That's the present fix of Natchez-Under-the-Hill!

Now the Mississippi River wants to gobble the remnant. Dikes deflect the current from it. Otherwise, the remnant soon would be washed away. But the big stream isn't easily balked when it really wants a thing. In the face of determined resistance, it has reached in and pulled down many a town—and it still has power to indulge its tigerish instincts. Consequently, Natchez-Under-the-Hill, as it is today, appears to cling to the feet of the bluffs in the attitude of a despairing sinner, who, belated in repentance, clutches the foundations of the Rock of Ages, while the Devil in person tugs to break the hold.

Thought of the remnant as a despairing sinner is justified. Bit by bit, the greater part of Natchez-Under-the-Hill was annihilated at a time when it was in full pursuit of the ways of the wicked. For the place was of unsavory fame. For more than a century it was known to the world as a star among hell-raising places. In England, and Spain, especially. Decade following decade, it was a loblolly of luridness like that of the wildest western gold mining camps, mixed with ribaldry and raw vice from the worst of creation's seaports, and the picturesque scurvy of halcyon flatboat and steamboat days upon the Mississippi River.

Mainly, because Natchez-Under-the-Hill was the river port of a rich country. Men made money there, hand over fist. The process was like a succession of gold strikes in one place. Cotton produced the gold. Men spent their wealth. They lived at the top of the pot. Thus, they established a big market—particularly for up-river products.

These products were floated downstream upon flatboats. In its palmy days, there was often a spread of flatboats fourteen deep, and two miles long, tied to the bank at Natchez-Under-the-Hill. Flatboatmen were wild fellows. Those who intended to float on to New Orleans stopped at Natchez-Under-the-Hill for the amusements it furnished. Ships brought luxuries and necessities from foreign places. Gamblers came from all parts of the world to game at Natchez-Under-the-Hill. When the steamboat era arrived, it introduced new elements of impurity . . . .

Genesis is usually bare of details. Particularly so in this case. Except that it probably began before the Revolutionary War, you can find but little about the origin and early career of the wildness of Natchez-Under-the-Hill until after it reached the point, along about 1830, when the counterpart of the vigilantes of the West was necessarily formed. They toned things down a bit. You get a slant at the result from this narrative:

"I next strolled through the lane which composes the town, and is occupied by a low class of barrooms, dancing shops, and faro banks, or roulette tables. They were each in full operation, although it wasn't yet 2 o'clock in the afternoon," wrote Tyrone Powers, the English actor in 1833.

"These doors all stood open to the street, and the interiors of the places were more obscene in their appointments than the lowest of itinerant hells found at our English fairs. Upon the tables, however, lay piles of silver, and behind them the ready croupiers administered. I observed wretched devils playing there, whose whole standard kit wouldn't have brought a picaroon at vendue. Numbers of half-dressed, faded young girls lounged before the barrooms, or at the doors, with here and there a group of the same style gen'mun to be met with about the silver hells of London; having, however, a bolder and more swashbuckler-like air than that of their petty-larceny European brotherhood.

"From no party, however, did our company meet with the slightest observation, although a very few years back for strangers to have strolled about here without other purpose than spying into the nakedness of the land might have proved, to say the least of it, a perilous adventure, as it is somewhat probable that they would have been followed by a long shot, likely enough to bring a book of travels to an abrupt conclusion, but even at Natchez-Under-the-Hill, manners, if not morals, are improving.

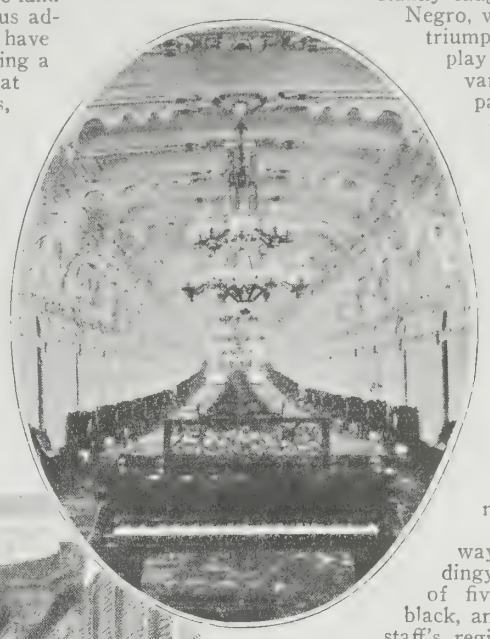
"Murder isn't nigh so common here as it was a few seasons back; although now and then one of an extraordinary nature does take place. A few months back, for instance, an up-river boat came here, and as is usual, several of her passengers were landed. Just as she was leaving the wharf, the crack of a rifle was heard, and one of the passengers, who had just gained the upper deck after his shore visit of an hour or so, fell dead, shot through the head. The wheels of the boat were backed, the corpse laid on the nearest wharf by the captain, with an account of the manner of his death, and this done, off went the steamer.

"The inquest returned a verdict of murder against some person unknown, which was duly reported in the journal, together with the unfortunate man's name, and an inventory of such things as were found upon him. It was presumed, as he was a stranger from the West, that in a play dispute he had excited a spirit of revenge among some of these desperadoes, which was thus promptly gratified."

And from the narrative of another traveler, you get a clear view of Natchez-Under-the-Hill, as it was about 1835, together with a slant at the lay of the place.

"The steamboat landed at the foot of the bluffs," runs the narrative. "But this is not Natchez. The city proper is built upon the summit level of a pile of gray and white cliffs.

"Tumult when we landed was varied, and increased by the incessant jabbering, hauling, pulling, kicking, and thumping of some score or two of ebony-cheeked men and urchins, who were tumbling over each other's heads to get the first trunk. A Negro stooped to take one of the handles of my trunk. The other handle was instantly grappled by a rival, and, both giving a simultaneous tug, the subject of the contest flew violently from their hands and was instantly caught up by a third Negro, who bore it off in triumph. This little by-play was enacted with variations in every part of the cabin of the steamboat.



"Landing, there was another trial.

"'Carriage, massa—mighty bad hill to walk up!' was vociferated on all sides.

"'No, no, no,' was no argument with them for cessation of the attack. Denial only made them more obstinate.

"Forcing my way through the dingy crowd—four out of five of them were black, and ragged as Falstaff's regiment of shirtless memory—I followed my athletic pioneer, who, with my heavy baggage poised accurately upon his head, moved rapidly and carelessly along the thronged levee.

"The general appearance of this place is far from agreeable. Strangers passing up and down the river, who have had the opportunity of seeing only this place, have, without dreaming of the beautiful city of Natchez on the bluffs over their heads, gone on their way with impressions very inaccurate and unfavorable. These impressions, derived only, but justly, from this repulsive spot, have had a tendency to depreciate Natchez, and fasten upon it a bad name, which it is very far from meriting. Like the celebrated 'Five Points,' in New York, 'Natchez-Under-the-Hill' has extended its fame throughout the United States in wretched rhyme, and viler story. For many years, it has been the nucleus of vice upon the Mississippi.

"The principal street, which terminates at the ascent of the hill, runs parallel with the river, and is lined on either side with a row of old wooden houses, which are alternately gambling houses, brothels, and barrooms. We gained this street with difficulty, picking our way through a filthy alley. The low, broken, half-sunk sidewalks were blocked with fashionably dressed young men, smoking or lounging, tawdrily dressed, highly rouged females, sailors, Kentucky boatmen, Negroes, Negresses, Mulattoes, pigs, dogs and dirty children. Sounds of Bacchanalian revels assailed our ears as we passed hastily along through an atmosphere of bad odors. Presently, we emerged into purer air, and in front of a very neat hotel. From near this place, extending along the levee to the north, commences the mercantile part of the 'landing,' lined with stores and extensive warehouses, in which is transacted a very heavy business.

"The whole of this town is built upon a reclaimed flat, bounded upon one side by the river, and on the other by the cliff, or bluffs upon which the city of Natchez stands. It rises abruptly to the height of 160 feet. This bluff extends along the river, more or less varied and broken, for several miles, though at no point so abrupt and bold as here, where it bears the peculiar characteristics of 'Dover cliffs.'

"The face of the cliff is not a uniform precipice. It is broken by an oblique shelf or platform, gradually inclining from the summit to the base. A fine road has been constructed along this way, with an inclination sufficiently gentle to enable the heaviest teams to ascend

Jerusalem in a Snowstorm: No Milk or Honey

Bananas Grow in Jericho and Anemones in Samaria When Blizzard Comes

By WILLIAM H. WORRELL

IT IS nearly impossible to see anything in the Holy Land as it really is. There is a haze of romance which obscures the fact. Of course, we go to Palestine to enjoy this atmosphere rather than to ascertain facts; hence the books about Palestine deal with atmosphere. Even the guidebooks tell us how to travel about in search of atmosphere. I doubt whether anyone would read an unsentimental book about the Holy Land. It is the land of sentiment, religious sentiment. Judaism, Christianity and Islam successively wove about it the fabric of religious tradition. It is a symbol and an abstraction. If you go to see it you will enjoy it only as such. There will always be a feeling that disagreeable reality is going to press itself upon your notice. When that happens you will be sick for a few days. Then you will put reality out of your mind, and keep realism out of your diary and your conversation.

Nevertheless Palestine is an actual place, in a cold, real world of stocks and stones, labor and recreation, politics and plunder, and natural and human things generally. It is full of the countless curiosities of life that interest us the world over. So, the first thing to learn about it is that it is not in heaven—as a certain woman supposed—and that it is, in fact, very, very unlike our ideas of that place.

Palestine is a land of climatic extremes: wet winters, dry summers, warm days, cold nights. The denudation of the land has tended to emphasize these contrasts.

A great cosmic change, which is not at present understood or even fully recognized, has crept over the entire Near East. It has dried out. Great cities like Palmyra and Petra, whose imposing ruins attest a large and luxurious population, now lie far out in the parched desert, without a drop of water, or a blade of grass, or an inhabitant. We do not know when the drying-up process began nor when it will end, whether it is permanent or periodic. There are no records of it save the monuments of nature and of man.

In 1913 Professor Hobbs visited the oasis of Khargeh in Upper Egypt, and there, in the midst of the Lybian Desert, found impressions of oak leaves in tufa rock. The oasis is now only about one per cent actual vegetation; and the oak is nowhere found in Egypt, for it requires a damp climate. But here at one time there had been a river, and oak trees upon its banks. If you will look upon the map of Jerash, the ancient Gerasa (Mark v, 1; Luke viii, 26), you will note the ruins of three baths, four mills run by water power, two natural springs, an aqueduct, a waterfall, and a grand basin for naval sham battles. There was plenty of water here in the first three centuries A. D. The place was deserted in the thirteenth. The great change that has occurred in the climate of Palestine since antiquity renders the biblical writers guiltless of exaggeration when they describe the Holy Land as "flowing with milk and honey."

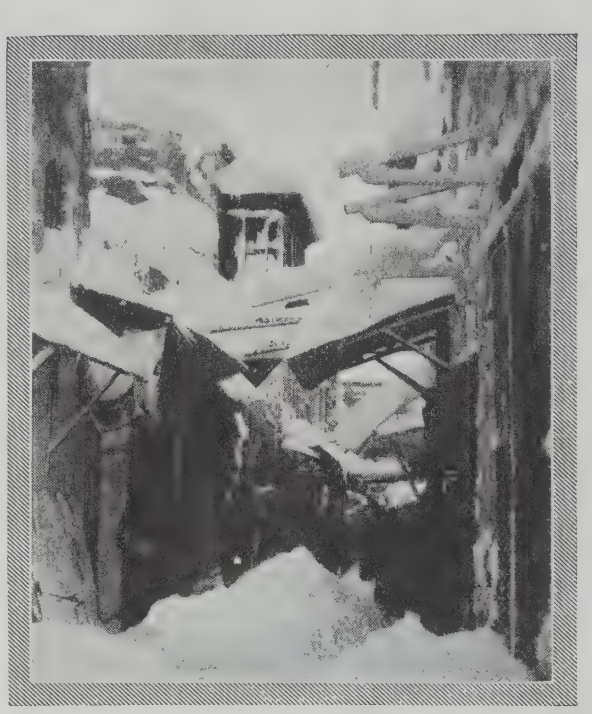
There are only two allusions to snow in the Old Testament, as falling in Palestine. I Macc. xiii, 22 tells of "a very great snow" which prevented a military attack; and II Sam. xxiii, 20 recalls the memorable "Day of the Snow" when Benaiah "slew the lion in the pit." The animal had strayed into the uplands and had been overtaken by a snowstorm, falling into an open cistern in his bewilderment.

No snowfall is mentioned in the New Testament, nor anywhere else that I know of, until A. D. 1494, when an Arab writer, Mujeer ed-Deen of Jerusalem, writes that more than seven feet of snow fell and lasted many days.

Quite as remarkable a storm occurred in February, 1920. We had been having fine weather. Down in Jericho the bananas were growing. Up in Samaria the hills were covered with the scarlet anemones and other brilliant flowers for which the Holy Land is famous. On the night of February 8, a fine rain set in, mixed with scattering flakes of snow, which soon fell in sufficient quantity to maintain themselves. On Monday, the eighth, Jerusalem awakened to a landscape white with snow: an unaccustomed sight to the Egyptian and Hindu troops, and a surprise to us who had seen the thermometer at 128 degrees F. in the October sun. The natives had never seen snow more than a foot deep, and that perhaps but once in their lives. They said this would not last. No one had ever heard of waist-high drifts in David street, or of complete interruption of railway and telegraph communications. Something had gone wrong: an Armenian winter had strayed south to the borders of Egypt. Travelers reported the Sinai Desert white with snow. Snow even fell in Cairo where it hardly even rains, in the Jordan Valley, all over Palestine. The thermometer dropped to 28 degrees, and the snowfall continued. Next day the skies were thicker and the flakes smaller, completely filling the air.

In the damp, unheated stone houses the stocks of food began to be exhausted and servants ventured forth to buy. But most of the shops and stalls were closed and barred, for the merchants feared the snow, and knew that need would presently bring high prices. There were no loungers to carry fuel for you if you found any. Barefooted women floundered in the drifts, crying with fright and pain. At the hotel well-groomed officers looked through lacy panes at the deserted streets below. The people were at home, biding in leaky chambers, without a coal or a candle or prospect of a supper.

And still it snowed. The fourth day found three feet of snow on the ground and the people sitting in resigned Oriental misery over a brazier of sickly coals. We were now entirely cut off from the world. The post office was deserted. The wires were down. People prowled about with knapsacks hunting something to eat or burn. Signboards, zinc roofs and balconies collapsed. The Jerusalem Cinema and the Y. M. C. A. fell in heaps, followed by the only steam carpenter shop in Palestine. Houses were vacated. The Hindus lay in their camp under snow and canvas awaiting the Judgment Day. Trees bent and broke.



David street, Jerusalem, on the fourth day of the storm. The shops are closed. Balconies and roofs have fallen in. Citizens are prowling in search of food and fuel.

On the fifth day came the end of the storm, and after that a gradual recovery. Such were no doubt the "very great snow" and the "Day of the Snow." This also would pass into history.

Though small in area—about the size of Wales—Palestine is badly broken up and incredibly littered with stones. It would take vast capital to build broad, smooth roads, fit for modern traffic, and standard-gauge railroads with new rolling stock; and every bit of fuel would have to be imported. The land produces nothing that would pay for such outlay and maintenance, and it is hard to see how it ever will. You do not discover how many hundreds of things you personally need until you go to a place where they cannot be had. Do you need a monkey wrench, or a G-string, or a typewriter ribbon, or a nut sundae? You will probably seek them all in vain. It takes years to set up the machinery of our modern life. There is no fuel but kerosene of a bad quality, or the last remnants of olive root dug out of the ground after the exhaustion of every other resource. There is no water but what you have stored in your cistern from the summer rains; and this is not improved by the film of crude oil placed there by the Health Department for the frustration of the mosquito. The new water supply of the administration remains a theory and an aspiration. Without fuel and without water power—there may be some hope of the latter—electric light and power are unobtainable. They are the very things needed to grease the wheels of life in so hard a land. Most of all one misses sanitation. There is only one sewer in Jerusalem, and that is maintained, I believe, by the cauliflower gardeners, who are professionally interested. To the Oriental congestion is the rule. The Orient is dirty and always has been, except in Greek and Roman times; and then it was more Western than Eastern. Early Christianity fled from Roman games and Roman baths as being things of the flesh. Early saints were very imperfect ablutioners; and their disciples more easily imitated this little peculiarity than their other and more important qualities.

As if the eye were not enough offended by the poverty and disorder of the East, there has now arrived the Western Curse of the Can. Everything comes in cans—or bottles—kerosene, gasoline, milk, butter, cereals, tobacco; and the discarded ex-containers litter sequestered spots when they do not serve the nobler purpose of flower pots and roofing. All that is needed now by a cook in Palestine is a can-opener and a corkscrew—preferably on one handle. The cast-off rubbish of ancient cities, on which they rose by their own indolence, contains mostly broken pottery by whose pattern and workmanship the different layers of the mound are dated. Future archeologists, in digging downward through the rubbish now accumulating, will know at once when they have arrived at the level of this memorable age of ours. They will call it the Old Can Age. How scientists will puzzle over the cultural connections between Jerusalem and Chicago! Why did these people get their food from the opposite side of the earth? Was ancient Hebrew civilization derived from that of New York? Did the Law go forth from the Bronx? Perhaps our own conclusions about remote antiquity are no better.

No city of Palestine is of any great interest or importance to the world except Jerusalem; and Jerusalem is only sentimentally important. You should picture it to yourself as a mass of gray stone ruins, dating mostly from the time of the Crusaders, within which dwell about sixty thousand persons, in a state bordering upon poverty, without sanitation, or any of the pleasant things of life. The city has spread out now, especially to the north, where conditions are a little better. Within the walls there is nowhere an open square, or a street where vehicles may pass: nothing but roofed-over passageways or gloomy, crooked alleyways, ill-paved and slippery, leading up and down, turning and twisting, with nowhere a pleasant view. These so-called streets were never laid out, of course: they just occurred. The walls of the houses fronting on the street are blank save for heavily grated windows, small and high up: eloquent of the lack of public spirit in their owners, and of the uncertainty of public safety in this City of Peace. Through these alleyways of moldering masonry we pass to observe the crowd.

Oh, what odors of Araby! Not pleasant, but pungent and original: donkey, fried fish, spices, dust, dog, coffee, freshly gathered grapes, the smoke of the heavy Persian tobacco, and well—things that after rotting once have started in to decay all over again.

It is unfortunate that the photographs which we see of the Orient do not give us any hint of this local atmosphere. It is important and characteristic and unforgettable. How tired and starved the people look! There is not one beautiful human being among them. One person in every three has lost the sight of one or both eyes. Their arms and legs are unsightly. Not even the laborers seem to have any muscles. The old-fashioned Jews, wan and waxy, look as though they had passed their nights since infancy poring over the Talmud on an empty stomach. They are supported by alms from Europe and America, as their fathers and grandfathers have been for many generations. Their contribution to society is their learning and sanctity. It is considered by people elsewhere a great privilege to support such a person in Jerusalem since one cannot one's self live there and study Talmud. What do the rest of these tired, sickly people live on? Probably half of them are similarly nourished by alms or contributions from abroad. Many of them are engaged in useful activities of an educational or charitable nature. Others cater in some manner to travelers and pilgrims, of whom there are a great number every year. There is little business in any Western sense except what is connected with the present restoration of the land; nor is it easy to see how there ever will be more. What does Palestine produce, what can it conceivably produce, that will pay for what it needs?

Unusual aspect of the Temple Area and the Mosque of Omar after the blizzard of February, 1920.

Then, too, the social obstacles to industry are almost insuperable. The only sign of brotherly love in Jerusalem is the borrowing of one another's holidays. The Christian shops close on Sunday, of course, and the

Dreadnoughts of the Air

Shall They Take the Place of Battleships?

By J. J. DEWEY

THE game of trying to sell the world new fashions in naval defense, warranted to do away with the giant battleship, is rather old.

In the seventeenth century it was the fire ship that was going to render the ship of line useless, but when the test came it was the fire ship that faded out and the big costly ship of line remained. Then the French allowed the gunboat bug to bite them and the fire ships' successor was going to prove the undoing of Britain. But when the clouds cleared away, the gunboats were nowhere to be seen; and the English still proudly rode the seas.

The idea bobbed up again with the advent of the torpedo and the steel age in the War Fleets. The torpedo boat was to sweep the battleship off the sea. Instead it gave us the torpedo-boat destroyer.

Undaunted by previous failures the "Enthusiasts" hailed with delight the invention of the submarine and at last the battleship was doomed. In this year of our Lord 1925 the battleship is still with us.

It is still doomed, however, this time by the airplane. From the day little David swung a pebble against the ponderous Goliath, up to the time Jack Dempsey flattened out the bulky Willard, and since then, mankind has been tickled with the idea of giant-killers. It is not surprising to find this: "Airplane supplants the battleship idea," being taken seriously in some quarters. It is astonishing, however, to see such headlines as: "President Believes Warships Doomed, Convinced World Flight Has Indicated Next War Will Be Fought in the Air." "Wilbur Speeding Across Continent to Decide Fate of Navy." The ignorant public was astounded to learn that the Navy's fate needed deciding. What is it all about? The old drama of the centuries is about to be enacted again, the battleship is to be pushed off the sea.

Some Bombing Targets

IN JULY, 1921, the Army and Navy conducted joint bombing tests off the Virginia Capes. The old *Alabama* and the ex-German vessels awarded to us after the war served as targets. Both Army and Navy participated and in all 75 planes were used. The tests were finally made on clear days with a smooth sea and no wind. It took exactly 9 hours and 37 minutes to drop 78 bombs to sink one little cruiser. The aviators sailed back and forth at a comparatively low elevation and dropped their explosives when they thought they were in the most advantageous position. The target ships were all anchored. Despite the limited scope of these tests, the army air chiefs came forward with a sweeping statement to the effect that the battleship was rendered obsolete!

In 1923 tests were conducted on a more elaborate scale. The *Virginia* and the *New Jersey*, two of our old pre-dreadnoughts, were used. These tests showed that great strides had been made in the art of attack; there was a notable improvement in the percentage of hits. But—to take a battleship out to sea and allow planes to drop bombs on it whether moving or anchored is not to simulate actual conditions of battle. Any attacking agent of sufficient size and power could do the same thing, and accomplish the same results. Destroyers could sink the whole United States Fleet with torpedoes if they were allowed to take point-blank shots, like the airplanes in the recent tests. Likewise a single superdreadnought could probably sink our entire fleet under the same conditions. A single German submarine sank four British cruisers at the beginning of the war, but subs made no impression at all upon the English Grand Fleet. Submarines and destroyers were present at the battle of Jutland and yet they did not account for a single capital ship. There is no doubt at all about the ability of an airplane armed with heavy bombs to put the capital ship, as it has been constructed, out of action, if it gets a good range. The navy men contend that, as with the destroyer and submarine, a proper defense would make it impossible for the airplane to get near enough to a ship to put in its deadly attack.

A Three-Plane Navy

THE tests made upon the *Virginia* and *New Jersey* developed a more efficient form of approach. First two or three fast machines flew over the vessels and dropped smoke and screen bombs. This would make it possible for the bombers to sweep down to the low altitude of 500 feet, drop their explosive and fly away. And then, if you believe the "air enthusiasts," it only remains to call in the junk man and sell him our entire fleet.

To all this the navy men reply that the airplane in its present state of development forms a valuable adjunct to the fighting fleet, and thus brings about the necessity of a three-plane navy, on the surface, above, and beneath. But because it is still in the stages of development, it cannot at present be looked upon as any more than an auxiliary to the Fighting Fleet. No well-protected fleet would at present be at the mercy of an air attack. The heavy bombers, which alone could do real damage, cannot be launched from plane carriers and must be operated from shore. This would limit their range of action to within 500 miles of shore. Besides, once the plane has dropped its bomb it is useless as it must return to its base for more ammunition. The modern battle fleet is protected by a screen of scouts that extends from 30 to 50 miles. The addition of the airplane has made it possible to extend this scouting system to 100 and 150 miles. It would be next to impossible, for a large fleet of planes, such as would be necessary seriously to injure or destroy a hostile fleet, to approach undiscovered. In addition, the United States Navy is in possession of one of the most valuable scouts in existence, the helium-filled ZR-1. It was the Zeppelin scout that informed Admiral Scheer of the approach of the British main fleet in the Jutland fight. Four or five helium-filled ZR's each with two or three small planes operating from them would make our fleet practically immune to a surprise air attack. The smoke screen, which the army flyers say they can create to hide their movements, can likewise be created by the surface ships to hide them from above. The greatest drawback of the airplane is its limited range of action, and the impossibility of using it in all kinds of weather. Von Scheer's aircraft failed to locate Jellicoe's fleet in Jutland for eight days and caused many an ambitious plan to be abandoned because this type of craft cannot be operated successfully in stormy and foggy weather.

General Pershing in his last annual report states that: "War-time experience and peace-time tests thus far made do not altogether warrant conclusions that either seacoast defense or battleship protection can be dispensed with." Of the bombing test against capital ships and the bombing results in the World War, General Pershing said: "Of course, some damage was done by aircraft bombing, and it would doubtless be somewhat greater in another war, but until it becomes vastly more probable than at present demonstrated, then it cannot be said that we are in a position to abandon past experiences in warfare."

The Navy Department has been extremely reticent over the results of the tests made in the sinking of the *Washington* off Cape Henry, and rightly so, for information of inestimable value was obtained. But the naval officers concerned have not been able to conceal the satisfaction they feel in regard to the showing of the *Washington* against all forms of attack, but especially against aircraft attack. Their previous conclusions seem all to have been verified in the Cape Henry test.

From one era to another," says Admiral Gleaves, "there must be a transition period of tryouts and experimentation. We do not abandon a perfect weapon and replace it by an undeveloped invention; the radio has not yet replaced the telegraph and the telephone; and fifty-odd years intervened between the fight of wooden ships at Hampton Roads and the battle of the super-dreadnoughts at Jutland. It may be we are at the threshold of a new era and the airplane model of 1980 may be an armored battleplane of 100 tons, 12,000 horsepower and 200 knots speed carrying 50-ton bombs, but in the meantime we must prepare to win wars with the weapons in hand."

Aircraft Limitations

A BATTLE fleet must be prepared to operate at all times and under all weather conditions. Airplanes cannot do this at present. The recent world flight though a great triumph for the army pilots engaged only served to emphasize the helplessness of aircraft in certain kinds of weather. Day after day flights were postponed because of unfavorable weather reports. The total number of hours of actual flying should be considered along with the months of time used between Seattle and Seattle.

The battleship is a floating gun platform that can be moved many thousands of miles from its base, can be operated in all kinds of weather, is protected from attack, a weapon of offense that can be used again and again as long as the ammunition holds out, a weapon with a defense that is not easily disposed of.

The airplane is a carrier of explosive which depends on its own motion for the sighting of the target and firing of the projectile. It carries a power plant which must both sustain it and give it forward motion. It has no defense against the high explosive except its speed and it cannot be used at any great distance from its base. By far the greatest objection against it, is the necessity of favorable weather for its successful use. In addition, once it has discharged its cargo of bombs it must return all the way to its base before it again becomes a military weapon. Until it can replace the surface ship at all times and under all conditions it can not be seriously considered as the major military weapon of the sea.

The Washington Conference agreement, though it failed to limit aircraft, laid a restraining hand upon their use at sea by limiting aircraft carriers. The big bombers, as was stated above, cannot be used with the carriers because it is impossible to launch them. How would they prove of any use in a fight thousands of miles from shore, when the battle would be beyond their flying range? The Conference on the other hand seriously restricted the development of battleship defense, by limiting the size of future ships during the duration of the treaty to 35,000 tons.

Improvement in the fighting ship has been brought about only by an accompanying increase of size. In the past 15 years we have gone from the *Delaware* of 20,000 tons to the *Massachusetts* of nearly 42,000 tons. *To limit defensive construction* to 35,000 tons for ten years when it had already greatly exceeded that amount, *while the offensive construction is allowed to develop at will*, is to place the capital ship under a great handicap indeed.

The day may come when the dreadnought of the air will replace the dreadnought of the sea. Air vessels of 100 or even 1,000 tons may be armed not only with bombs but even with guns just as our surface ships are armed today. Until that day comes the American public will not demand that the Army and Navy Department give up a system which is known to be efficient.

Great Inventions

The Sewing Machine

By FRANK D. HOPLEY

THE invention of the sewing machine, which probably has proved the greatest boon to women of any invention of modern time, might be termed the result of a chance conversation.

In 1840, a young mechanic in Boston, by the name of Elias Howe, overheard a conversation between his employer and another man who chanced to call at his place of business.

The man said very emphatically that a great fortune was awaiting any one who would invent a machine that would sew as well as if not better than a woman with a needle.

That night Howe went home determined to invent such a machine. For many evenings thereafter he sat and closely watched his wife sewing with her needle, trying to evolve a plan whereby a machine could be made to do the work.

He at once began to experiment. For many months he worked, using all his spare money to buy material and to have some of the parts which he could not make himself worked up. In fact, he spent so much money on his models, that he was at last forced to abandon his experiments for lack of funds.

The Struggles of Howe

THEN a friend by the name of Fisher came to his assistance. He offered to board Howe and his family at his own home free of charge; gave Howe the use of the attic for his workshop, and also supplied him with materials and tools, so great was his faith that the machine would be a success. Howe promised in return for his kindness to give him half the profits on his machine.

Howe devoted himself to his task with great ardor, until at last he had completed a machine that would sew a seam. As proof of what the machine could do, he sewed on it all the seams of two suits of clothes, one for himself and the other for Fisher.

The machine had a curved needle with an eye near the point, and the action of the needle was something like that of a pickax.

In 1841 Howe patented his invention and then set out to put it on the market. Here he met with failure. People laughed at it and scoffed at the idea that a machine could be made to sew, in a practical way. Many were curious, but the money to finance the making of the machines was not forthcoming.

Then Howe issued a challenge. He asserted that his machine could do the work of five sewers, and in less time.

In a spirit of fun his challenge was accepted by five of the most expert needlewomen in the city. Ten garments were cut out, each one being exactly alike. Five of these were given to the sewers, and Howe took the other five to work on his machine.

At a signal the race began. Before the sewers had half their garments made, the five which Howe had sewed on the machine were completed. This stopped any further discussion as to the merits of the machine. But now another cloud arose in Howe's sky.

When the story of the wonderful achievement of Howe's machine was spread abroad, the tailors rose in anger and protested against it. They said it would take the bread out of their mouths, and Howe was roundly berated for his attempt, as they said, to make capital out of the workingman's loss.

Finally convinced that he could do nothing in this country, Howe persuaded his brother Amasa to take the machine to England to see what he could do with it there. Amasa was successful in getting William Thomas, a corset manufacturer, interested in the machine. He offered Howe £250 for the English rights, provided Howe himself would come over and superintend the machines, which Howe did at a weekly salary, and his family joined him.

Howe Defeats the Pirates

IT WAS not long, however, before Thomas and Howe quarreled, regarding repairs to the machine, and Howe was dismissed. Not being able to find any work in England, after a short time Howe found himself in such financial difficulties that he had to pawn his American patent rights to get money enough to bring himself and family back home.

When Howe reached America again, he found that his patent had been pirated by a company of wealthy men, and that machines were being rapidly turned out and put on the market, where they found a ready sale.

But Howe was not to be downed. With admirable spirit, he asserted his rights and claimed that his patent covered all those machines. Being at this time able to obtain financial backing, he brought suit for infringement. After long litigation the case was finally decided by a court order directing the makers of the machines to pay Howe a royalty on each one they had sold, and would sell. In time these sums reached a huge amount, and during the life of his patent, Howe acquired a fortune of more than $2,000,000. Great honors were now showered on him from every side, and he was lauded as a benefactor of mankind, or, more properly, womankind. The French Government took cognizance of his invention and bestowed on him the Cross of the Legion of Honor.

The machine invented by Howe worked what is known as the "lock stitch," but since Howe's invention, numerous improvements and modifications have been introduced by other inventors.

Mr. Ford's Page

IF ONE were to say which single element, aside from the natural love of liberty, is the essential, most characteristic and most preservative institution in government, one would say the Courts. Comparatively few people have anything directly to do with them, but everyone is affected by them, and the degree of confidence or lack of confidence which the people have in them is the index of political health.

Absolute justice is not possible to any Court because it is not possible to human nature; our knowledge is not broad enough, our sense of principle is not deep enough to enable us to see or to do exact justice. But in our Courts we have established the General Conscience, as it were, by reference to which in detached calm and on a basis of accepted principle we hope to arrive at a workable degree of justice. If in all our human efforts we fail of the absolute justice, we are at least successful in reducing the degree of injustice—and this result, though negative, is not to be scorned.

It should be well understood that Courts do not give us our rights; it is our sense of rights that gives us Courts. Our rights go very far back. They go back of the common law, for that law became common because certain rights were made common. In our American documents we call them "certain inalienable rights," that is, rights that may not be taken away without violence to the law of our nature and our national compact. But their being inalienable now does not argue that they were always possessed and enjoyed. For the most part they had to be fought for and bartered for. Usually they began as "special privileges" of the powerful, and, being desirable, the people fought for or bought them. That is the one hopeful thing about "special privilege" when it does not mean an evil advantage; it points to the general privilege which is coming to all. Many of our rights were born that way. The strongest and most progressive took them for themselves first. Then they were extended to all men.

The common law was based upon common conviction and practice as to common rights, although in its earlier forms it recognized many things as rights which we should regard as oppressions now. But it provided a standard to which men could appeal, and the interpreters of that standard were what we know as Courts.

The multitude of laws which confront us today—a wilderness of statutes and ordinances—does not by any means indicate an increase in men's rights and liberties. There has been a great increase to be sure, and it is difficult to see where more can come by purely political decree. Doubtless mankind's liberties will be greatly expanded by growth of character and by recognition of the need for economic liberty (not freedom from economic law, but liberty within economic life). But this wilderness of laws means something else: it means that whatever rights we may possess, we are not careful of others' rights, as we ought to be.

Our basic Constitution defines our rights, and we are coming to see that it ought never to be tampered with except to enlarge the statement of our rights, but our *laws* mostly define the limits of encroachment upon human rights. You have only to examine the ordinances of city councils, the enactments of state legislatures and the Acts of Congress to see this. From all sides have come invasions of people's rights. In a multitude of forms, selfish interest has trespassed upon social good. And law after law is formed to say, "You shall not do this, or that, or the other thing."

Sometimes these restrictions are themselves encroachments upon very definite rights, and when this is the case we are made aware that anybody can make a statute, but it takes a wise man to make one that roots in basic rights. When a statute hinders progress because progress itself will cause some readjustment (and people are naturally averse to readjustment even for progress) then it is a rule which is not lawful in the deepest sense—it does not root in the law of life.

It is this possibility which makes it necessary to have in the public service men who know what the law is and who are competent to say whether ordinances, statutes and acts are fundamentally lawful. The Supreme Court occasionally pronounces a Congressional Act as unconstitutional, by which is meant that it does not harmonize with our fundamental body of rights. It is a service not to be despised, this measuring of legislative action by the deep principles of basic law, or basic rights.

However, people as a rule do not think or care much about these things; they only see the Courts, and they have their own opinion as to whether the Courts are protecting public rights or private privileges. Of course, most of the causes brought before the Courts are private causes. Two parties disagree, there is misunderstanding, bad intent or downright trickery involved, and the Court is appealed to as referee. Sometimes a Court is able to untangle a matter so skillfully that the justice belonging to either side is given it. Sometimes the verdict is so clear-cut as to give the impression that all the rights are on one side and all the depravity on the other, which is very seldom the case. There is usually a measure of right on both sides, and it would render our Courts less like gladiatorial arenas and more estimable as wise dispensers of justice if oftener they could put both parties at a point of a new and amicable beginning for the creation between them of the joint work they had undertaken.

As it is, however, Courts resolve themselves into Judges. A true Judge, a man of wise, balanced learning and experience, a man of unblemished character, a man who is able to divest himself of all prejudice and invest himself with an exalted sense of public responsibility whenever he sits down in Court, or in his chambers to determine a case—such a man is a pillar in the temple of national integrity. It would be difficult to overstate the feeling of satisfaction and security which a just Judge, an able Judge, a fearless Judge can give to the community in which he holds Court.

There is no higher position in the nation than that of Judge, and the pity is that it is so frequently reached by the back-alleys of politics. The high opinion which our people have of the institution of the Courts makes them loath to indulge in criticism, and yet there are undeniable murmurs of amazement when certain elevations to the Bench occur. This is a bad sign. The choice of a Judge should commend itself to the people among whom he will serve, as it always will if the person chosen be a man of ability and character.

To use judgeships as political rewards, when they should be conscriptions of learning and integrity for the public service, is to weaken our country far more than any alien propaganda could do. And there is no treason comparable to the betrayal of public confidence and the spirit of justice when a man whom we call a Judge uses his office as part of the machinery of special financial or political privilege.

The bribery of Judges is not even suspected as once it was, but there has sometimes arisen a question whether the real bribery was not affected when the man was made a Judge. Did the Press, the Financial and Political support given him to favor his appointment constitute a subtle obligation which he was expected to recognize in the future? A true Judge has no obligation except to the law of justice.

Our whole judicial system from Justices of the Peace to Judges of the Supreme Court depends on the confidence which men can have in the individual Justice of the Peace and the individual Justice of the Supreme Court.

THE Courts come directly in contact with a comparatively small proportion of the total population, yet the character of the Courts sustains or injures the general popular confidence in government. No survey of public administration can omit the Courts. They are, in a true sense, the Keepers of the People's Conscience. But, practically, Courts narrow down to Judges. A Judge is given a unique place in the community, is presumably lifted above the drift to injustice, prejudice and dissension. A Judge's place is priestly and the whole meaning of his office is that he shall serve the public good impartially in the temple of justice. Nations rise no higher than their Courts, and Courts can rise no higher than their Judges. Judges should not enter Courts by the back-alley of politics. When they do the Courts decline, and public confidence with them.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Conferences and Commissions

THERE was once a Royal Commission appointed to decide what was Scotch whisky. It was appointed through pressure made by the distillers of what is known as "pot still," or pure barley malt whisky, who objected to the competition of all kinds of concoctions labeled "Scotch." For three long years the commission sat, examining a multitude of witnesses and often deliberating far into the night. And at the end it issued a report to the effect that *Scotch whisky was whisky made in Scotland.*

The beautiful simplicity of this finding and its incontrovertibility awoke the admiration of the whole civilized world; but in certain quarters it did not give unbounded satisfaction. For example the taxpayers did not feel that they had got value for the huge sum spent in the investigation, and neither were the "pot stillers" pleased, but the commission had "sat" and "reported"—so that was that.

This brilliant inquisitorial fiasco raised the whole question of conferences and judicial commissions, and investigations and probes generally, and there was a feeling on the part of that great body, the "general public," that such conferences and commissions were no good anyway except to pile up expenses and provide copy for the newspapers. At the present moment a commission appointed by the Baldwin government is sitting to find out why food is so dear, and it is most likely that its conclusion will be of no more value than that of the court of inquiry on the liquor. If it reports that "food is dear because it costs so much" it will get about as far as most investigations get. The President of the United States also has his agricultural commission—and may the results of it equal the hopes held for it! An honest and thorough investigation into some of these matters would have the effect of dynamite.

Within the past few years there seems to have arisen what may be almost called a craze for holding conferences of all sorts, which could not better serve to dissipate real purpose or destroy real vision if they were deliberately invented for that purpose. Most conferences are steam-rollers in the hands of not too scrupulous controllers to flatten out any indications of thoroughness in inquiry or impartiality in fixing responsibility. Nothing of importance comes from committees and conferences, unless the misuse of the people's hopes from conferences may be important. The really big things are born and launched by people who are under necessity to get them done, commission or no commission, conference or no conference. In fact the history of commissions and conferences is marked by their inability to understand and their hostility to the doers.

How Long?

HOW long will it be before pacifists see the futility of discussing measures for the promotion of the world's peace while the arch-mischief-makers of Moscow are permitted to stir up violence in every country?

The real rulers of Russia are not the members of the Soviet, but the Jew Zinovieff and his confreres of the Communist internationale. The blight of their influence is seen in the civil strife in China, in the ominous rumblings in the Balkans, in the outrages in Egypt, in the general dry-rot and stagnation which exist all over Europe.

It is a cause for congratulation that the United States Government refused to have any dealings with the Soviet so long as its activities were directed by the Red terrorists of Moscow. The American attitude may help all the nations of the world get at the root of things. Jugglers with the world's peace have unlimited funds for their propaganda. Where do these millions come from? They are not collected from any legal source in any orderly way. They represent the gold of tortured Russia, diabolically consecrated to the overthrow of peace on earth and the destruction of good will among men.

The first duty of the Peace Police of the world should be the apprehension of the universal source of exist all over Europe.

"Black Cap Justice"

IN AN article entitled "Black Cap Justice," which appears in *John Bull,* the writer, the well-known English publicist, A. G. Gardiner, discusses punishment for murder. The genesis of his article is the case of William George Smith, an ex-soldier who was executed for wife murder, despite a popular demonstration of surprising magnitude in favor of the condemned man. Says Mr. Gardiner:

"A criminal sets out on a dangerous adventure in which he may be discovered, and for which he may be severely punished. It will probably make a profound difference to his preparations for the adventure if the Black Cap has to be reckoned with . . . . If he knows that killing means death for himself, he will leave his firearms at home."

This observation is certainly well founded on Britain's comparative immunity from serious crime, which in turn is traced to the swiftness and sureness of British justice.

The vision of the judge assuming the Black Cap before passing the capital sentence makes a would-be murderer pause so far as England is concerned. The fear of death, in the absence of the fear of God, would doubtless have the same effect on the criminals of this country.

Fair Dealing

THE people of the United States have a right to do what they will with their Constitution, but they ought to *know* what they are doing when they do it. A bald proposition to turn the Constitution over to a private group to tinker as they will, would meet with national denunciation. But that is precisely what is done whenever an amendment is adopted on a one-sided hearing. In the matter of the so-called, but misnamed, Child Labor Amendment, this paper has been obliged to call attention to the fact that there is a side of the question which the proponents of the amendment never discuss. It is gratifying that the desire to hear and discuss the other side, and both sides, is becoming general. Women's clubs, especially, should be careful not to think or act upon one-sided propaganda, but should demand of their leaders fair dealing in presenting all the facts. No human right can suffer from an insistence on the whole truth.

No Extremes

"LET'S talk of graves, of worms, and epitaphs," by which Shakespeare did not mean that men should seek consolation in the dungeons of despair, but rather that by getting the correct perspective, they might make a fresh start on a straighter course.

There are enough "Dismal Jimmies" in this world, and to spare, telling their tales of woe with a nobody-knows-the-troubles-I-have sort of an air. And there are also enough men of standing who have become chronic calamity howlers, who love to be able to say "I told you so" when the dismal opportunity comes. Such people are a public nuisance. Prophets sometimes are charged with austere or unpleasant methods, but the true prophet is usually distinguished by a strong leaning toward possible avoidance and escape.

There is also, of course, the type of man who goes to the other extreme and poses as a super-optimist. He may be as ignorant of a country's prospects as a man from Mars, yet he is able to induce a number of people to follow his lead into painful disillusionment. Both these types are blind leaders of the blind.

There is a middle course between these two extremes, the course of sanity and a respect for facts, though not imposed upon too much by facts, for facts are only small items in the truth. No extremists are wanted in the government of a country. Cranks may be useful in breaking up ground for what is yet to be, but they are poor managers of what exists.

Bingham, Sapiro vs. Co-operation

THE DEARBORN INDEPENDENT is grateful to Judge Bingham for his second-hand attack on this paper's efforts to give the facts of a certain one-man system of co-operation in this country. The articles in question were published when the farmers were at work in the fields and are only now being read and studied. Judge Bingham's outburst will further advertise them. The first roar of disapproval, of course, was from the salaried officials. And their disapproval was pathetic. There was one direct and final answer to all that THE DEARBORN INDEPENDENT has said. They had only to show that the Sapiro system *had worked,* that the hundreds of thousands of farmers held by its contracts *had benefited.* That answer would have been entirely sufficient, but it has not been made. If even a plea in avoidance had been made, on the ground that agricultural conditions were generally bad, and then had it been shown that at the very worst the members of the Sapiro system were better off than independents, that also would have been a sufficient answer. But it has not been made. The reasonable assumption is that neither of these answers can be made, and our most careful search has not revealed any basis on which they could.

Instead, men of Judge Bingham's character, who ought to know better, are engaging in the perfectly futile business of misrepresenting THE DEARBORN INDEPENDENT'S attitude on co-operation in general. If Judge Bingham likes his position as Sapiro's spokesman, well and good, but it would seem to be prudent for him at present to keep as near the facts as possible, and even divulge some at present unpublished facts which would perhaps come with better grace through him than through this paper.

The history of this paper's work is perfectly clear; it is in print everywhere. Beginning in February, 1924, this paper published eight articles on co-operation by Huston Thompson, Chairman of the Federal Trade Commission, which showed the successful co-operation of farmers in Europe. That series of articles was the most intelligent boost which the idea of co-operation had ever received in a non-agricultural publication. This office then became flooded with the protests of American farmers who had felt the pinch and burden of the Sapiro system, and an investigation followed. The fact that Aaron Sapiro is a Jew has nothing whatever to do with whether his system is workable or is a failure. THE DEARBORN INDEPENDENT would have been very glad to find a Jew who was doing really good work for our agriculturists. It is not a fact to be concealed that the new movement in agriculture is under the direction of Jews who are not and never were farmers. Its significance as a fact may be minor, but its status as a fact cannot be denied.

How a criticism of the workability and success of the Sapiro system can be construed as enmity against co-operation, is a matter that must be explained by the mental processes favored by Judge Bingham. A DEARBORN INDEPENDENT writer intimated that co-operative buying has always been more successful than co-operative selling. Every co-operative authority agrees to that. There is no principle of co-operative selling in this country that has been universally applicable or successful. Both the Secretary of Agriculture and the President of the United States have said that co-operation is not a panacea for the farmer's ills. There are, however, numerous instances where able and honest management of co-operative selling has resulted in great benefit to the members concerned. This paper has given articles describing such instances. But they were not Sapiro instances. Some of them were successes that had been made out of Sapiro failures by throwing out the Sapiro system.

This paper agrees with every co-operative authority that there is as yet no co-operative system universally applicable or successful, and that immense harm has been done by self-seekers and exploiters in the name of co-operation. If an interest in co-operation and an attempt to rid it of exploiters and mountebanks is enmity, then this paper must be denounced as an enemy, for that is just the program it means to follow. It means to give the American farmer facts about his "friends" which he ought to know.

If, on the other hand, ridding co-operation of its failures, its grafters, its fakers, its false guides, is a service to co-operation, then THE DEARBORN INDEPENDENT will prove to be one of the best friends co-operation and the American farmer ever had. Our position is entirely without strings, entirely without self-interest or compulsion. Can Judge Bingham say the same?

It is our belief that if men like Sapiro are given freedom to run ten years longer, the very name of co-operation will become a stench in the American farmers' nostrils.

A supply of artesian well water.

The Miracle of Water in the Philippines

America's Most Useful Contribution; Advent of Health and Cleanliness

By WILLIAM L. STIDGER

At the town pump in Mololos.

"WHAT is the most useful thing that the Americans have contributed to the Philippines?" I asked a well-known, college-educated Filipino, as we sat on a big rock facing Manila Bay one beautiful evening. He did not answer for a long time. As he pondered my question I looked out across that beautiful bay. It was a picture of enchantment such as would make the angels sing with joy.

Up yonder to my left was the Southern Cross. It gleams in the early evening skies with its stars like gems eternal. It was my first sight of the Southern Cross. I had never stood under its tropical brilliance before. It thrilled me as I looked up at it, for one had to travel far to see its sacred form. To the north in front of us was the small Dipper. I had often seen it at home. Above our heads back over our shoulders to the northeast gleamed the Great Dipper with its last star pointing to the Pole Star.

In front of us gleamed the lights of the ships at anchor in the great harbor. It formed a beautiful picture. Red and green lights from bow and stern and white lights high up on the masts. There were great passenger ships, and many sailing vessels, with now and then a private yacht gliding through the waters. Far out beyond them all flashed alternately the red and green lights of the breakwater marking the narrow path through which the ships have to sail to enter Manila harbor.

The Monday wash day takes place at the artesian well in the Philippines.

The carabao that pulls this cart spends half of his time in the water.

Suddenly two things happened to bring my friend out of his reverie. One was the flashing of the signal lights from two battleships talking to each other in the darkness. They were using the Morse code. I watched them for a few minutes entranced when suddenly two brilliant stars lost their anchorage in the harbor of the western skies and burned themselves out before us. A few days before a great oil-carrying ship had lost its anchorage in Manila Bay, drifted as far as the lighthouse at the mouth of the Pasig River and there exploded. It, too, burned its life out, with twenty-seven men in its furnace of death down there where bay and river meet.

These two stars made a brilliant path of fire which was reflected in the water at our feet. My Filipino friend jumped as if startled; looked up a minute into the sky as the last flash of the departed glory of two burning stars died away; turned to me and said, as calmly as if the angels had not just given us a sublime spectacle: "Why, the most wonderful thing that the Americans brought to us in the American occupation of our islands was the artesian well. That has saved our babies from death!"

He was deeply thoughtful again for a few minutes. I thought that I would have to call on the angels again to shoot another pair of stars to awaken him from his reverie, when he turned and said, "I lost a baby a year before the Americans came. If she had had pure water to drink it would have been different, the doctor said."

But aside from the personal element in this intelligent Filipino's judgment, I am sure that that is the consensus of opinion of the thoughtful people of the islands: that the Americans have brought no greater gift than that of water in the form of the artesian well.

The Bureau of Health informs me that in a direct ratio they watched the death statistics drop, especially with children, as artesian wells were introduced. First there were a hundred wells put down by the Americans and wherever these wells were drilled the death rate among children dropped 50 per cent.

"It was a thrilling thing to watch," said the man with whom I talked in the Health Bureau. "It was like what you folks in the churches call 'a miracle.' We not only made the 'desert to blossom as the rose,' but we transformed a desert of stagnation in which little children died by thousands through filth and disease into a place of health in which they might play and live without fear of disease.

"Then there were a thousand artesian wells drilled and then two thousand and then three thousand, and now nobody attempts to tell you how many there are any more than he would attempt to tell you how many pigs and dogs and chickens and goats swarm in the yards, kitchens and highways of Luzon. They are without number."

Filipino children need water both inside and out.

Drive along the hot, dirty, dusty highway of any Philippine road with the blistering tropical sun beating down on your head; watch the half-naked natives sitting under the fountain of water that pours from these spouting wells; watch them bathing in its refreshing stream, watch the men, women and children carrying great jugs of water on their heads, watch the constant stream of people, going and coming; for water is life under the burning, blistering, sapping, searing, scorching sun of the tropics; watch the little naked babies playing under its fountains; watch the weary-faced mothers holding their brown breasts under its cool touch; watch the women washing their clothes under its bountiful stream; and you will begin to know what a blessing the artesian wells are to the Philippines.

"I never realized what a blessing water was until I came to this sun-parched country!" said a business man with whom I traveled across Luzon one blistering hot March day.

We had stopped a dozen times to fill the boiling radiator with water from these artesian wells. They simply line the highways. They seem to occur every few hundred yards and wherever they spout their subterranean springs a crowd of little brown, bare-bodied children, and men and women are gathered about the refreshing flow.

"Thank God for water!" said one of the party.

It was a prayer. It was an exclamation of praise. It might have fallen from the lips of a David in sweeter music, but no more sincerely.

"Why do you feel so deeply about it?" I asked him. And then was sorry I had asked him because of the look in his eyes. I had pried into the innermost cloister of his heart.

"I had two babies. One died the first year that we were here because we could not get pure water. She was caught with the dreaded amoebic dysentery and died in a few hours. That was many years ago. Another baby came and for two years we thought we might lose her but this pure artesian water saved her."

He had seen the old days and he had seen the new. He had seen the filthy mud holes, and carabao wallows, and sinkholes of disease and dearth and death from which the natives had drunk their water. He had also seen these artesian wells spring up all over the islands with American occupation.

"Thank God for water!" he said again. "I believe that I have uttered that prayer from the depths of my heart more times than I uttered any prayer in my life. You would know what it meant to us if you had been here from the beginning as some of us have."

"Yes," said another member of the party. "I used to see mothers lean over with their brown babies on their hips, brush away the green scum from stagnant pools along the roads and let their children drink from those pools of disease and death!"

"Didn't they know any better?" I said.

"They *had* no better. It wasn't a matter of knowing any better. See how they use these artesian wells now that they have them."

He didn't need to call that to my attention. It was wonderfully apparent. I stood one entire morning photographing people as they came to these wells up in Mololos. It was one of the most thrilling mornings I ever put in. I saw the miracle of water in action.

The wells are arranged with double spouts and often with triple spouts. Out of these spouts the water flows in great gushing streams. There came a little child with a great jar on her baby head. She put the jar on the ground and let it fill. There was no pumping to be done; no labor. All this child had to do was to smile at me, watch my camera, and let nature fill her water jar for her.

Even before I was through taking a picture of her bare brown feet and her bare legs and breasts her jar was full to overflowing. The sound of that full measure of water was sweet to hear. It poured over the top of her jar and bathed her hot little sun-browned feet.

Then came a woman, and I caught her as she bent

(*Concluded on page 14*)

The old New England "town pump" is the artesian well in these islands. Here is the open form of democracy, the bathhouse, the health resort of the islands.

The English Fascisti and Britain's New Era

Baldwin Victory Makes Change in Outlook: The New Party of Youth

By PAUL TYNER

THE new British Government has started to work and it becomes possible to size up its salient features. The victory of the Conservatives was a tribute to the "business brain" and to the astute political strategy and tactics of Stanley Baldwin. His triumph was due to no flash of genius, nor to any "brilliant stroke" of luck, but to thorough and careful preparation. As a matter of fact, Mr. Baldwin had been devoting himself assiduously, almost from the moment he went out of office, to mending the breaks in the party fences and strengthening the weak places which that election revealed. The Conservatives were really the only party not caught unawares by Mr. MacDonald's snap dissolution. They were fully prepared well in advance and ready for the run.

In selecting his cabinet, Mr. Baldwin has shown himself to be more than a politician without a soul above party aggrandizement.

A Party of Youth

IT is not merely that these selections indicate that Baldwin is big enough to rise above personal or partisan grudge or resentment. The absence of these men from the Government Front Bench in Baldwin's previous short-lived administration, and from the Opposition benches in the last nine months, sadly weakened the debating power of his party. Furthermore, it is apparent that in passing over the Old Guard (especially the "Die-Hards") and selecting the men who fill the twenty-one places in his cabinet, he has been governed in practically every case by the desire to secure a business administration, putting into each job the man best qualified by character, training and experience to fill the job satisfactorily. He has recognized that he owes his immense majority, and the large freedom of action it involves, to national more than to partisan sentiment, and that he need be hampered by no narrow jealousies or antipathies in his own party in framing and carrying out broad national policies. So, although personally a Protectionist, he gave the politicians the surprise of their lives by making Winston Churchill, who is a confirmed Free Trader by both tradition and conviction, Chancellor of the Exchequer; an office to which is attached much more power in framing the fiscal policy of the nation than that attaching to the American Secretaryship of the Treasury.

The new Parliament is distinctly a party of youth. No Parliament in many years has contained so large a percentage of young men. This is all to the good, especially as the new Premier has generously recognized young men of ability and ambition in the appointments of both heads and under-secretaries of the various departments.

Friendliness for France

THE annual Lord Mayor's dinner at the Mansion House in London is usually made the occasion for important announcements of policy by the head of the government. This time the dinner was celebrated on the evening of the sixth anniversary of the signing of the Armistice, which is here called "Remembrance Day." Most of the newspapers rather emphasized the Premier's promise that an endeavor would be made to continue the Empire Exhibition at Wembley next year; but little note was taken of the much more important pronouncements made without rhetorical fireworks for which such an occasion offers a tempting opportunity. The Premier gave special assurance of friendliness for France. He announced that the foreign policy of Britain would be one of continuity and respect for treaties, with some implication of special interest in the carrying out of the Dawes Plan as arranged by his predecessor in the recent London Conference. He had not a word to say about carrying out the "Imperial Preference" tariff proposals, restoring trade emergency duties on imports, or the resumption of the plan for a strong fortified military and naval base at Singapore, for the rejection of which measures his party so hotly criticized the MacDonald administration. This complete abandonment of the protective tariff issue, on which he fought the campaign of a year ago as a remedy for unemployment, accounts obviously for the astonishing surprise of his appointment of a Free Trader to the Chancellorship of the Exchequer in the place of Sir Robert Horne, a strong Protectionist, who held that office in Mr. Baldwin's previous administration, and who was regarded as certain of reappointment.

Mr. Baldwin did not once refer to the League of Nations in his Mansion House speech. During one of his election speeches, he commented somewhat sarcastically on his predecessor's "international mind," declaring that as for himself he "did not know the meaning of the word 'international.'" It is not difficult to draw the conclusion that the new British Cabinet is as shy of the threatened Disarmament Conference, in connection with the Geneva Protocol, as are both France and Belgium. Leading Conservative journals are already hinting broadly that "national and imperial considerations make it questionable whether Britain should ratify the Protocol, at least without definite amendment of the clauses involving the placing of the British Navy at the disposal of any international body."

As always, Britain is particularly sensitive concerning any measure that may affect her sea power. Even so distinguished a Liberal statesman and friend of the League of Nations as Lord Grey, in a recent speech, declared: "I will never be a party to anything which gave to a foreign tribunal power to order the British Navy about."

The new Premier has made an excellent start in appointing a Royal commission to investigate and report on the cause of the abnormally high prices now prevailing for foodstuffs of all sorts. Bread, meat, and vegetables are costing 80 per cent more than they did in 1913, and prices are steadily rising. The commission will doubtless make good use of the excellent report brought in last spring by the Linlithgow commission. This plainly showed that the blame for high prices rests not upon the producers nor upon the ultimate distributors, but upon the middlemen, the wholesalers and jobbers, and upon the transportation companies. Profiteering, in fact, is rampant on all sides in England today. This, taken together with the income tax of about 20 per cent and beginning with incomes of a little more than $500, and the fabulous rents exacted on account of the extreme shortage of housing accommodation everywhere, causes such crushing burdens on the masses that there is a steadily increasing howl of protest going up. It is more than probable that a bill for the control of food prices will be one of the first measures to be brought in.

Decrease in the Jewish Element

THE Cabinet committee investigating the Zinovieff letter—of whose authenticity there is no longer any doubt in the Foreign Office—is being extended into the whole subject of Bolshevist propaganda. A probable outcome of this inquiry will be measures for the wholesale deportation of thousands of such propagandists now at work here. Moreover, Britain seems likely to take a leaf out of America's book in the matter of strict regulation of immigration. The cry is already going up from the workers—even in the trades union ranks—that the flooding of this country with the dregs of Russia, Poland, and Hungary, spreading subversive and revolutionary social theories and lowering the British workman's standard of living by their cutthroat competition, must be stopped. Here, of course, the new government will be likely to give offense to the members of what Winston Churchill once delicately referred to as *"a certain sect"* that made its way to Moscow stealthily in twos and threes from the ghettos of New York, Chicago, London, Warsaw, Paris, and Berlin. It remains to be seen whether British public opinion will prove as strong as did American opinion in pushing through a really effective immigration law.

For one thing, the Jewish element has been reduced to small proportions in the new government, neither Sir Philip Sassoon, Under-Secretary for Air (Lloyd George's whilom Fidus Achates), nor Samuels, the new Postmaster-General, having seats in the cabinet.

In this connection, another reason is suggested for Mr. Baldwin's action in allowing Sir Robert Horne to fall outside the breastworks. During his election campaign at Glasgow, Socialist hecklers cornered Horne in the course of a speech, hotly denouncing the Bolshevists as unworthy of financial credit. They showed that an engineering firm in which Horne was managing director had large contracts with the Soviet government. Horne, by the way, without waiting for the opening of the new Parliament to which he secured election, has started on a long trip to India.

Business Methods

THE new Prime Minister is a long-headed business man and is applying business management not only to the administration of national affairs (for Winston Churchill's appointment means at least a rigid policy of economy), but also in the significant widening of the basis of the Conservative party organization. Under this plan, every constituency will be entitled to an additional representative on the Central Council of the party, and this representative must be a wage-earner or the wife of a wage-earner. As the national executive of the party is chosen by ballot of the members of the council, this change is bound to bring a marked alteration in the personnel of the party's governing body. During the campaign, Mr. Baldwin made special appeal to the workers' vote, and even boasted that his party would poll a larger number of working men and women than that polled by the Labor party! His first activity in the matter of probing food profiteering is also a strong bid for the support of the working-class housewife, as well as that of the middle classes.

The British Fascisti

PERHAPS the most significant straw showing the direction of the political wind in Britain is the rise of the British Fascisti. I was present recently at a Sunday afternoon demonstration by this body in Trafalgar Square. Army officers predominated among the leaders and speakers, and the Fascists, numbering about 10,000, who marched into the Square and clustered around the plinth of the Nelson column guarded by the famous Landseer lions, showed plain evidence of military drill and organization. Besides the men carrying banners and representing local units from every section of the London area, there was a "woman's unit,"—and a particularly enthusiastic unit it was, although none of them figured among the speakers; they were assigned to the less theatrical spade-work of distributing literature and scouting for new members among the crowd which always fills the Square on an occasion of this sort. On leaving Trafalgar Square, following a hearty singing of "God Save the King," the Fascisti marched in military order down Whitehall street carrying with them a great white and purple wreath (the Fascist colors) on which the words: "For King and Country" circled a huge initial "F," which wreath they laid at the base of the cenotaph.

I managed to talk with several of the privates in the ranks and found that many of them were unemployed ex-service men glad of the temporary job of carrying banners and marching in companies, displaying big Fascist badges on their coat lapels. The tenor of the speeches was militant throughout, denouncing the Communists as a serious menace to the Throne, the Church and the Family, and appealing strenuously for recruits to this new organization as the only one capable of meeting force with force.

That the movement has deeper springs than any emotional terror of the "Bolshies" is evident from the fact of its careful and thorough organization. While stridently emphasizing their loyalty to the King and their hatred of "red revolutionaries," it did not seem to occur to any of them that there was any inconsistency in organizing a semi-military body for extra constitutional interference by violence with the political and social evolution of the country nor in this implied distrust of the Royal military and naval forces, as well as of the Parliament constitutionally chosen by the people. Not that the movement is directed against the present government, save as a hint that it must mind its p's and q's and look sharp after the Communists in the matter of stern repression of their activities, especially in the matter of so-called "Communistic Sunday Schools," in which little children are taught to voice hatred generally, much in the style of the Moscow schools.

Standing by the King

BACK of the British Fascisti organization, on the financial side, is the Federation of British Industries, of which Sir Eric Geddes is chairman at a salary of $100,000 a year. There are also the "dyed-in-the-wool" Tories and "Die-Hards," headed by Lord Younger, head of one of the largest brewing companies in the country and a former chairman and organizer of the Conservative party who was largely responsible for the break-up of the Coalition that hurled Lloyd George from power and reinstated Bonar Law. As may be imagined, this extreme "right wing" of the Conservative party is far from being in hearty sympathy with Stanley Baldwin's broad and liberal policies, being, in fact, fiercely anti-Labor, anti-Socialist, anti-Communist and anti-Bolshevist.

This movement represents in Britain a growing tendency toward a dictatorship based on lack of faith in the adequacy of any parliamentary government to tackle the problems of the time, especially in the matter of guarding the country from the peril to which Russia has fallen a victim, from which Mussolini saved Italy, and from which General Primo de Rivera was counted upon to save Spain.

In Britain, however, the appeal would hardly be to a dictator, but to the King. The King is always there and the Throne and the People would naturally be found standing together in an emergency.

When the Cold Springs Stage Was Robbed

More Reminiscences of Ralph Kenyon, One of the Last of the Plainsmen

By F. J. CLIFFORD

IN 1876, Mr. Kenyon, with three others, were developing some "diggings" on Slate Creek, exactly where the B. & M. Railroad now crosses. The names of the men he could not remember as Indian nicknames had been given each of them. Owing to his stocky build, Kenyon was named Squatting Bear. Another was Spotted Tail. Big Bull was the name applied to one huge fellow, while Rockerfoot was given the man who operated the rocker in their placer mining.

One Sunday, they were outside their camp, some busy and some doing nothing at all. Spotted Tail was baking a batch of sour-dough bread in a Dutch oven. Taking the lid off, he raised the oven up and to one side, to put more coals under it. At that instant, three young Indians, all painted up, decked out in little war-bonnets and using inflated bladders attached to thongs with which they pounded the ground with a booming sound, burst from cover, on their ponies, and started stampeding away some thirteen head of horses that belonged to the camp.

"We were taken so completely by surprise," Mr. Kenyon said, "that we didn't realize what they were up to. At the first alarm, our horses galloped toward us, but the little warriors, they were not more than fourteen years old, rode right up to within fifty yards of us before they succeeded in turning the animals back.

"Old Spotted Tail was the first to recover his senses. Whirling about, he dived for the tent but in the excitement put his big bare foot right into the pan of bread. Cursing and howling with pain, he grabbed for his forty-four Winchester with one hand and with the other clawed at the scalding hot dough that clung to his foot.

"By the time he got squared around, the Indians with the horses in front of them were disappearing up a side draw in a cloud of dust. Spotted Tail sent a round of shots after them but only succeeded in killing one of the horses, which happened to be his own. The profanity he indulged in while he dressed his blistered foot made ordinary swearing sound like a minister's benediction.

"The daring Indian boys were joined by some warriors on top of the bluff, who had been waving a buffalo robe at them in some kind of prearranged signal. The young scamps were after 'coues' (credit marks). When they got a certain number, they became full-fledged warriors. We never saw our horses again."

Later on Kenyon was washing gold on Castle Creek. One day a mild-mannered, blue-eyed young fellow, named Cary, came along and asked for work, saying he was broke.

"I can't give you any set wages," Kenyon told him, "but the claim is paying grub and if you want to go fifty-fifty with me, grab a shovel and dig in."

The man turned out to be a good worker. At that time there came one of those "buck-skin-heroes," as the old plainsman called them, who went by the name of Texas Jack. The man was of truculent nature and boasted of so many "killings" that some of the hard-working miners were rather afraid of him.

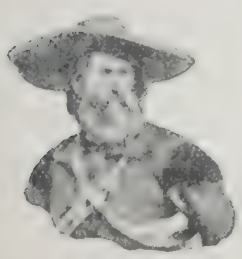
One noonday, as Kenyon and his new partner were finishing their dinner, Texas Jack walked in. He was soon telling them of the number of Mexican greasers he had carved up, as he whetted a long bowie knife on his buckskin-trowsered leg, when Cary turned and, looking the man in the eye, said:

"I don't believe a word of it."

In an instant he found himself looking into the muzzles of Texas Jack's forty-fives. Cary didn't act concerned. He dug reflectively at his teeth with a deer-leg toothpick for a moment as he looked the "bad man" over.

"You're a brave man, now—ain't you?" he remarked at last. "Some brave man you are to pull a pair of guns on a man whose only weapon of defense is an old pewter fork. Put those things back and behave like a human being."

The "buckskin-he—ro" hesitated a moment, then as he slid the artillery back into the leather holsters, he remarked: "I wouldn't lower myself by killing the likes of you. When I pull a gun—I want it to be on one that's not afraid to stand up and fight."



The words were hardly out of the man's mouth before Cary had whipped a gun from somewhere and had it leveled on the breast of the "bad man."

"Get down—!" he barked. "Down on your knees—you white-livered coward—and say your prayers and say 'em fast 'cause you're going to die."

The death knell in the voice and the ominous look from the cold-blue eyes of Charley Cary seemed to knock the very legs from under his erstwhile antagonist, who dropped to his knees. So abjectly did he beg for his life that Cary looked him over a minute then spit out the one word:

"Git." The he—ro got, instantly but not fast enough to escape the heavy miner's boot planted in the seat of his pants by Cary.

"Git out of the country," he shouted after the fleeing bad man. "If I ever see you around here again, I'll fill you so full of holes, you can't make a shadow."

The man pulled right out, not only to escape from Cary, but he knew full well the hazing he would get when the story got around the diggings.

Some two weeks after this, there appeared at the diggings a rather tall, middle-aged man. An odd, strange kind of man, he seemed to possess a subtle influence over Cary. So much so that Cary quit the claim and Kenyon. After dividing their gold dust, Cary and McBride, the name the strange man went by, left that part of the country.

Later on, they killed a buffalo, one of a few strays left in the country. The meat was sold to a butcher in Rapid City. But as buffaloes were hard to get, they butchered a steer that had wandered away from some bull-whacking freight outfit. This was easy money, but too slow. So they started in to horse-stealing. Al Sears joined them, and a little later, Frank Martin.

They rustled horses until May of '77 when they were joined by McLaughlin, who suggested that they hold up the Cold Springs stage that had just started over a new road between Cheyenne and Deadwood. So it was agreed. Cary planned most of the deal.

On the day of the holdup, they rode to the Cold Springs station and, overpowering the keeper, locked him in the barn, with instructions to be quiet and he would stay in good health. The outlaws then went to the house and knocking some chinking from between the logs through which to poke their rifles, all waited there except Cary who took up his position behind a tree a short distance down the trail.

RALPH N. KENYON.

As the stage rolled up, the driver looked for the fresh team that should have been harnessed and waiting. Instead, McBride stepped out and ordered "Hands up." Instead of doing so, the driver, yelling to the horses, cut loose with the long braided four-horse whip. The animals had hardly taken one jump when a rifle barked from the log house and a passenger who had been sitting beside the driver toppled over dead.

As the excited horses gained headway, Cary, from his position at the tree, shot down one of the leaders. This threw the whole outfit into confusion.

The robbers then lined up the driver and three or four passengers and relieved them of what valuables they had. As they were doing this, the two outriders, Scott Davis and Boone May, came galloping up. Seeing what was going on, they immediately opened fire. There was a spirited reply to this by some of the gang who had fled to the log cabin. Boone May put spurs to his horse and fled. But Davis immediately "treed" behind a big bull-pine from which he could control the situation. Cary saw this and checkmated it by placing the biggest one of the passengers between him and Davis. Not wanting to kill an innocent man, Davis agreed to leave if Cary would let him get to his horse. This was done, and Scott Davis backed up to the horse and, keeping an eagle eye on the gang, rode away.

The stage was known as "Old Ironsides," due to some steel sheathing fastened to its sides. A small safe inside was torn from its fastenings and rolled outside, where it was "cracked" by some giant powder. The loot obtained was one brick worth ten thousand dollars, one worth four, some four thousand dollars in dust and the jewelry of "Madam Moustache," a notorious character in the mining camps of Deadwood.

"The next morning after all this occurred," Mr. Kenyon remarked as he sat at his workbench finishing a pair of bear-paws, "there came a knock at our cabin door, where Elik Dow and I were working a claim on Moonshine Gulch. When I yelled to come in, who should it be but Charley Cary."

"'How's chances for something to eat,' he inquired.

"'You can fill up just as soon as my partner can get it ready,' I answered.

"While it was being prepared Cary handed me his Henry rifle with a request to fix the front sight that showed a fresh break. I put in a bone sight from the shin bone of an antelope. After breakfast, he asked for a light team, saying he had some 'dry diggings' (pay dirt that has to be hauled to water) up on the head of Slate Creek that was paying big. I told him that French Henry had a team on his claim a mile and a half below. Down there he went and soon returned, with it, an old rickety wagon and Henry.

"'Have you a pair of gold scales?' he asked.

"When I told him I had he asked me to weigh out two hundred and fifty dollars and give to French Henry as payment for the team, wagon and harness.

"Well, sir—" the old man remarked as he tugged at a rawhide thong, "Cary just pulled a handful of dust from his pants pocket, and poured it into the pan. I knew right then and there that something was wrong. In the first place, men that work for the stuff don't carry their gold dust loose in their pockets. They carry it in poke, a buckskin sack, an inch or two thick and six or seven long.

"Next, his dust was rusty—and coarse—fourteen-dollar stuff from the Deadwood country. Down where we were and where he said his claim was, the gold dust was bright and worth eighteen and a half to nineteen dollars the ounce. Just what he had been up to I did not know and said nothing as I knew nothing of the holdup at that time.

"After the deal was closed, Cary picked up his rifle and trimming the sights a little, he tried it out with a couple shots at a mark.

"He next asked for some wild hay that a man by name of Hawk had cut for bedding. I gave him what he wanted. With it in the wagon he drove into some timber close by. He soon came out again on the trail between Hill City and Caselton. He was alone as far as I could see. He inquired about getting food at Tigerville and Hill City, then drove away. That was the last I saw of him for several years.

"After Cary had disappeared, Hawk and his partner heard a horse whinny over in the timber where Cary had been. They found two stage horses there, one with blood on its wethers, although it was not from the horse.

"We took the horses into Deadwood and turned them over to the stage people. When we got back home, a man on a big gray horse all covered with lather, asked us if we had seen Charley Cary. I said nothing as I had noticed that the men in those days who said the least, usually lived the longest. But my partner said, 'No—what do you want him for?'

"'For robbing the Cold Springs stage and killing a passenger. Two thousand dollars for him—dead or alive,' the man yelled as he spurred his horse away.

"A posse of twenty-one men was organized at Rapid City by a Dr. Somebody—I don't remember who. They located Cary at his camp that night on Battle Creek. Feeling sure that the robbers could not get away, they decided to await till daylight to open up the ball. But when daylight came, the men and horses were gone, leaving the wagon there. Lacking good trackers, they could not follow them.

"In '88," Mr. Kenyon continued, "I was in the Wind River country, but the prospects were no good so I headed back for the Hills. One foggy morning as I followed along the divide between the Cheyenne and Missouri waters, who should I meet but Charley Cary!

"There—in that high lonely country—all the details about the stage holdup Cary told to me, the only person to whom he ever told it all.

"I left Cary in the fog of the divide," the old man said, half to himself as his gaze wandered across the blue waters of Kootenay Lake. "He wanted me to go to the 'Roost' with him, but when I found he was with the Big Nose George gang, I made the excuse of having to be back in the Hills.

"I warned him that he would die with his boots on. He agreed with that but said that no man would lay

Europe Faces Cheap Transportation Enigma

Government Paternalism in Car Ownership Prevents Post-War Reconstruction

By A. R. PINCI

THERE is nothing that Europe needs so much as cheap transportation. At no time did Europe need this boon as today, with the railroads still showing the scars of war time, with oxen and horses numerically depleted, with the people at large temptingly accustomed to travel.

Nothing so much conduced to war as the lifelong isolation which kept the people of one village from intermingling with the people of the next village.

What few ancient inhabitants remain who pride themselves for never having descended to the valleys if they lived on the mountains, or for never having crossed the river or the bay, or for never having visited the capital of the province, are dying off. Their progeny may err in the opposite habit, they want to be on the go, whether the physical distance to be covered is of few kilometers or across the country. And this new desire to move, to travel, to look about upon the world, is giving concern in high places.

This new tendency has attracted the attention of Europe's leading psychologists and has disturbed not a few sociologists and government officials. It puzzles even those who manifest it; many among these feel as if they are unfaithful to family tradition and paternal example by this touch of wanderlust.

But what it really amounts to, as I see it fresh from another tour of Europe, is a problem of speed, or, rather, of lack of speed.

Two-thirds of the populations of England, France, Italy, Germany and Austria, after fifty months of speed—war speed, intensified and multiplied in every conceivable human and mechanical way—have been forced back into a snail's pace manner of living which induces restlessness and collaterally produces inefficiency.

Yes, *forced back*. By whom and by what? By government officials and by an artificially stimulated drift to restore ante-war living habits. Every government official or similar authority has been proclaiming that post-war Europe is a different Europe than that previous to 1914, and then promptly proceeds to apply all the maxims, all the habits, all the ideas in vogue in pre-war times. Feeble attempts have been made to legislate in consonance with present-day requirements, but the fact is that the best part of productive Europe is being gradually squelched by a mass of laws and political expedients that act as a slow poison on the masses and render them helpless.

It is very true that Europeans like to take their time about doing many things, even in the conduct of their business, but they are not so very far from the serve-self era of urban United States. It is really immaterial how the Europeans wish to divide their twenty-four day and working day, respectively, but there is no denying that they have learned, more or less vaguely, more or less tragically, that a little speed added to each day is the same as lengthening life.

From the summer of 1914 to the autumn of 1918 every government official, every noted private individual, preached, urged, sought speed. Speed was the password; to be speedier than the people at the next frontier was the price of salvation. Nature was met at every turn with the need of making it yield forth its bounties irrespective of either calendar or clock. Under the water or in the air or on the earth, the goal was to increase speed. "Get there and do it" was the order of the day, which, translated into American, means, beat the others to it.

Taxing "Luxuries"

THE war over, the people returned to their homes and affairs with a characteristic that hitherto had been only latent. The habit of speed was something new, but speed is useless without a horizon.

Every new government since the war has been short-lived because it has failed to take into consideration the fact that *the people in general* were overlooked amid fantastic theories of national betterment. Instead of letting the masses work out their own problems on this score, government after government has come along with endless proposals to be annexed to ancient laws, which show that the men responsible for this state of affairs (a few of them survive in Washington, too) have forgotten their kindergarten lesson that one cannot add an orange and a pencil "to equal" a cat.

I questioned prominent government officials, active or retired, and not a few private individuals whom I considered authorities on the subject of speed, transportation speed, which is an important element of Europe's present difficulties. I have also asked the people themselves. From Southampton to London to Dieppe to Lyon to Marseilles to Rome to Milan to Zurich to Leipzig to Bremen, chiefly third class, often broken into small journeys, with constant substitution of passengers who in each of those countries truly represented the solid citizenship—I have talked with great cross-sections of the people themselves.

Europe does not travel by rail as much as it did in 1922. The standing-room-only trains are still to be found, but the vertical-sardine-packing fashion is not in vogue now as it was two years ago. Train equipment has been improved and increased, to be sure, but what has really happened is that by increasing rates and other ways *travel has been discouraged* by the political powers that be. This is an effort to overcome the nomadic tendency growing out of the war.

The result? Merely that the people are kicking and dissatisfied. They want cheap transportation—and they want plenty of it. They want to move about; they resent the force being exerted politically from above which would push them back into their native nooks and glue them there for the rest of their lives.

One need not examine economic conditions in Europe in detail to realize that it will be many decades before Europe's railroad transportation will meet requirements, not forgetting that the people's requirements will increase in the meantime. So the only alternative is the railroad's lieutenant—the motor car. An American has only to think of the railroad situation in the United States, its politics, its government control, against both all the national wealth of the nation and the automobile "spread" here, to realize what the European is facing in the way of a problem.

Not one of the authorities I questioned satisfactorily explained the present stalemate. Some defended the policy responsible for it, but this much is obvious to me, comparing what the people I talked with said they wanted, and what the "higher ups" think is coming to them:

England, France, Italy and Germany are full of inconsistencies and contradictions with respect to the problem of transportation for and by the masses.

The governments say that the people haven't the money to buy automobiles and still less so gasoline. So they discourage the motor industry locally, and place drastic and impossible duties on gasoline imports, not to mention all the other "luxury" taxes that go with the automobile. As one dealer in Stuttgart said, the only thing about automobiles which has not been taxed in Europe is the name "automobile" itself.

"It's about time," he added with heartfelt satire, "that some legislator should tax every book and dictionary containing the word."

Cars for Favored Few

CAN this attitude be explained by Europe's desire to protect its own automobile industry?

In a way, yes, but that protection is not really a major economic problem in the life of any of the nations mentioned. France is experimenting with a small motor car and so is Italy, with England close behind. But a small motor car and an inexpensive motor car are not synonymous—in Europe. From the European standpoint the small motor car has nothing to do with price, because even the little car is supposed to be a vehicle for the very well-to-do.

In other words, *the general political doctrine throughout the Continent is that the middle and next-to-middle classes have no business to own an automobile*—and accordingly if laws, sumptuary laws, can prevent such ownership, the acme of "good statesmanship" has been achieved.

Yet there are thousands, perhaps tens of thousands, of Germans, French, English, Italians, who would be riding in motor cars today, doing it within reason with due regard to national economics and private efficiency, but for the coercive legislation that seals their pocketbooks.

Many of the governing officials of Europe profess both astonishment and marvel because *"so many American wage-earners"* have automobiles. They consider this the eighth wonder of the world. But when it is suggested that they duplicate this wonder on a small scale at home, they play deaf, dumb and blind. I believe that politicians see the European motor car market divided as follows: the nobility, millionaire industrialists and government officials.

My question was this:

"Why not motor cars for the people?"

Their answers were these:

"Because they are a luxury." "Because we haven't the raw materials." "Because our money is depreciated." "Because our country has no petroleum."

So, the answer might as well have been "Just because—" for all the satisfaction any of the others gives.

As a matter of fact, not one answers the question. Each fails, also, as a plea in avoidance.

European nations have failed in solving the cheap transportation problem, whether in theory or in actual practice, but do not wish to admit failure, especially in view of the possibility that Americans could solve it. Not only could, but would.

If tomorrow all restrictive and economic fallacious measures were removed from the European markets, it would be not only possible to deliver cars and tractors in Europe at a figure representing the F.O.B. price or other standard price set by the manufacturer, but it would be possible to sell them, because there is a market for them, politicians notwithstanding.

Just why a duty ought to be imposed upon an article that is not manufactured at home is one of those puzzles that only the *Congressional Record* and its foreign brothers attempt to answer.

An official—I sha'n't reveal his name or nationality for obvious reasons—said that the stiff duty is imposed with the hope that "foreign manufacturers will come here to establish branch plants to be operated by native labor." Theoretically, that intention is understandable; practically, not at all, unless the manufacturer received a guaranty that a multiplicity of laws and taxes would not threaten or bankrupt him at an inopportune moment. Honest American manufacturers who have endeavored to establish factories abroad have met with insuperable difficulties. One great European fear is that American standards of wages and conditions of employment might be introduced, which would upset "the labor market."

It goes without saying that a manufacturer does not have to be urged to establish branch factories abroad, but it also goes without saying that no American manufacturer can look favorably or confidently upon a policy that is intended to urge him to do so without definite guaranties.

Politicians in Europe, a term which is intended to include many governing officials, deplore the lack of a petroleum supply, speaking in this case from the standpoint of the automobile, regret the difficulty of importing an adequate supply, and then apply the highest duties imaginable on a product that ought to enter free. There is no reason at all why adequate supplies should be obstructed by these fiscal barriers.

If oil entered free, or plus a nominal "duty" to satisfy administrative custom-house recording costs, an adequate supply would follow automatically, and there are enough big oil companies to look after such new territories. For example, if ten times as much oil (meaning all the fluids necessary to an automobile) entered Italy annually as is now the case, without duty, the Italian treasury would not lose a cent, and the people would be the gainers.

Yet an Italian official told me that the high duty on foreign automobiles is to discourage the importation of benzine which is a "luxury" item. But if so, why the high duty on benzine?

Gasoline without duty would not be a luxury for Europeans. It is a *necessity*. It is, today, the greatest necessity there, and gasoline at the cost of delivery to the consumer, plus a reasonable profit rated by competitive methods, is something that European fiscal officials ought to provide for, together with a fairer attitude toward the small motor car manufacturer.

From Singen to Leipzig, which means traversing representative industrial Germany, the problem of how to get a cheap motor car seemed to beset several fellow passengers. These included salaried manufacturers' agents who had to be "on the go" a great deal of their time; small business men, including one who manufactured a specialty which he wanted to introduce himself in Southeastern Germany before embarking in a wider campaign elsewhere; and some who had lived in the United States prior to the war and had the automobile habit and could afford to satisfy it in Germany *if* German officialdom were reasonable and did not prohibit small automobiles of the kind to which they were accustomed by oppressive duties or prohibitory statutes.

Another contradiction is revealed in the taxi situation. The cheapness of European taxis has long been a source of discussion by and among returned tourists; and early in December, when a big New York company announced a reduction all along its system, it was advertised that its taxis were now cheaper than in Europe. Europeans are responsible for the taxi as a national institution; prior to the war every one considered the London and Paris taxis a boom to humanity. Compared to what it cost me in 1912, say, to go from the Waldorf-Astoria to Times Square, the run from the Bank of England to Charing Cross, or from l'Opéra to Place de l'Alma, was nothing at all.

My very latest experience with European taxis in the leading cities of five countries does not bear out the contention of European statesmen that the automobile is a luxury. If the automobile is a public necessity and benefaction when called a "taxi," why is an identical automobile owned privately a *luxury*? Maybe some European statesman-economist will see this question—and will answer it.

"What I want above all is a small car," a silk salesman told me, mentioning the name of the car preferred, and I quote him verbatim (name deleted). We were traveling from Stuttgart to Nuremberg, and in the four hours or so I had ample opportunity to put in some questions on a subject which he himself volunteered when he learned I was from the United States. "I want a car that will take me where I have to go and do it quickly and cheaply. But I can't have it. My choice is restricted; either a big car or some second-hand mess that will eat me out of the house in repair bills. I tried to get one the other day, but I didn't succeed. Laws, permits, duties, taxes—oh, a rich man can get what is a poor man's car in the United States, but here I am, prevented from legitimately expanding my business by adding an efficient method to it, because the government says No. And there are hundreds of men in my predicament.

Germany's Need

"AND do you know what our kick here is? That not only there is no little car for us to get, but none is provided. A small car is not on the program of the government, so far as I know. I admit business is not very good and the future still uncertain, but that is no reason why German business men shall be hampered by being deprived of the right to get a machine."

In transportation German efficiency is at low ebb. One need only go through the big cities to observe how ancient is the method of delivering goods, bulky and light. For bulky and heavy material, such as coal, steel and stone, one sees carts and trucks left by the curbside until unloading has taken place, which may be a matter of a day or several days. Meanwhile, the teams have been detached to do service elsewhere, and in due course of time the empty vehicle will be removed—a double hitching and unhitching operation. And this apart, of course, from the obstruction dangers in the streets decorated by these "amputated" delivery services.

A German official told me that increased speed would mean finishing up the work to be done so much sooner—and there is not enough work to be done now! As to that, I believe I prefer the opinion of the business man who says he needs and wants a car, as against the Berlin official who frowns upon it. If German officialdom begins to be so paternal to business men that the latter will not be permitted to exercise their business freedom and judgment in transportation problems, then German reconstruction is indeed far in the future.

Yet Germany gives every evidence that it needs speed, that speed is essential. So do other European countries. The ancient implement of speed—*the whip*—is forever

(Concluded on page 14)

Was Spain's Dictator for King or People?

Inside View of a Situation Which Grows Very Delicate After Fifteen Months

(From Our Spanish Correspondent)

FOR fifteen months Spain has uncomplainingly submitted to the government of a military directorate. This directorate is composed of eight generals and an admiral under the presidency of General Primo de Rivera. The secretary of the directorate is General Nouvilas, a Mason, probably a Republican, and erstwhile chief of the Juntas Militares (Military Committees). Primo de Rivera is an amiable, talkative Andalusian with no particular capacity for government. He is a "good fellow," very brace, rather stupid and a little vain. He has a complete lack of self-consciousness and no sense of the ridiculous. He has been able to frustrate the intrigues of his enemies by his daring and *aplomb*. Although a dictator he has the liberal tradition and was always one of the army's rebels. He is by no means a Mussolini. His movement has not the slightest resemblance to Fascismo. It was not a popular movement. It was a revolution from above, and behind the neutral, amiable personality of General Primo de Rivera—of whom an unkind critic said, "He believes himself the secret agent of Providence in Spain"—the Republican and Monarchist elements of the army were and are still to some extent united.

One of the chief reasons given by Primo de Rivera for the *coup d'état* was the need for exterminating the grandiose corruption of the preceding political régime. The constitution was suspended. Public liberties were withdrawn. The Cortes was closed. A severe press censorship was established. Martial law was declared. Part of the judiciary was suspended and there was no more trial by jury. Abused as all the public rights had been, they had never before been abolished. And although abolished—for after fifteen months of dictatorship there has been no lessening of military repression—abuses continue and apparently no one minds. A campaign against the politicians of the old régime was started. One of the ministers, Don Santiago Alba, escaped over the frontier. The rest have not been molested, though at the time their "responsibility"—this was the catchword of the hour—was to be investigated. Fifteen months have passed and not a trial has taken place. No charge has been proved against the ousted politicians, and although most people are agreed in condemning the undoubted and tremendous corruption of the old régime, the army itself was just as much concerned in it.

There is a large number of Spaniards—I speak of those who follow politics—who have serious doubts about the sincerity of these corruption charges. There are significant facts. In Spain the civil and military powers have always been at odds. In the absence of public opinion, governments were obliged to look for support to the army. Spain's history is dotted with military dictatorships none of which had pleasant ends. For the last thirteen years Spain's politicians and generals have had to face a war in Morocco. The annual cost of this war more or less equals the annual deficit. The reverses and customary losses in Morocco were a constant source of strain between the civil and military powers. The politicians claimed the army never did its job. The army claimed the politicians always interfered. In 1917 the Juntas Militares—or Military Committees—were formed and from then dates an ever-growing intervention in politics by the army. In 1921, Abd El Krim defeated the Spanish army in Morocco at Anual. The Spanish losses were huge, both in men and material. Harrowing tales of the sufferings of the ill-equipped army were told. An official investigation was made. The published report gave details of corruption and incompetence in the high command which were unbelievable. It showed how government funds went into the officers' private pockets. It was no wonder the half-fed, half-equipped Spaniards ran before the Moors.

Staving Off a Public Exposure

THERE began to be heard in Spain the beginnings of a formation of public opinion. A cry went up for the punishment of those responsible. What was the cause of the disaster? General Sylvestre, in command at Anual, shot himself when his men ran. He had advanced to an exposed position and been overwhelmed. Why did he advance? Why did the general-in-chief, General Damasco Berenguer, allow his junior officer unusual liberty? I have spoken to members of the Parliamentary committee which investigated the question of the responsibility for Anual, and they have all said, "General Sylvestre was acting on the direct orders of the King." Without probing deeper to test the truth of this charge, the events that followed are interesting. A furious public demand for the "responsibilities" went up. General Damasco Berenguer, general-in-chief and high commissioner of Morocco, was to be tried as chief responsible. Many other lesser officers had already been tried and some condemned by court-martial. Feeling ran so high that the president of the Supreme Military and Naval Court, General Aguilera, had a free fight in the Senate with another enraged Senator. General Aguilera was out for justice however high the official involved.

The Parliamentary committee appointed to investigate the "responsibilities" was to present its report when Parliament opened in September, 1923. All the year there had been a distinct movement to the left. There were serious syndicalist outrages in Barcelona. What would have happened if Parliament had met and discussed the misdeeds of the powerful personages mentioned in the report we cannot tell. We know that Spain was experiencing one of its first manifestations of public opinion.

But Primo de Rivera's *coup d'état* forestalled the opening of Parliament and thus prevented the report from being made. He promised to deal with the responsibilities, and the agitation died out. It may be significant that one of the members of the provisional Directory was the brother of Damasco Berenguer around whom the agitation had been circling. When it was suggested to the King that he had engineered the *coup*, he replied with an enigmatic smile. A sheaf of decrees claiming to reform abuses was issued. Law and order were re-established by military force. Syndicalists and terrorists were jailed, escaped over the frontier, and in any case remained very quiet. The country, forcibly relieved of the consideration of unpleasant problems, began to breathe more easily. Again the day of reckoning had been fortuitously put off to some vague "mañana" (tomorrow).

After ten months of office Primo de Rivera himself raised the question of the responsibilities. Damasco Berenguer was tried. In view of the new conditions his acquittal was a foregone conclusion. But no! There was a clashing of opinions in the army and Berenguer was condemned. It may be mentioned that General Aguilera, who had in the past insisted so strongly on the need for justice, had been previously retired from the post of president of the Supreme Military and Naval Court! The result of the trial leaked out to the journalists and they were forbidden to publish it. Primo de Rivera came hurrying back from Andalusia—and, within five hours of the sentence, announced a general amnesty covering all Moroccan offenses!

The King Has Staked His All

SINCE then Madrid has been alive with intrigues and rumors. The King had staked his throne on the success of the Directory. When the Directory goes, he goes. He has made several unsuccessful endeavors to get back to constitutional government by going over to the camp of rival generals. The necessity for a change of horses is obvious. But it is risky work while they are at full gallop. The Directory has now become stronger than its master. The King is a man of few friends today. The old politicians whom he spurned are against him, with the possible exception of Count Romanones on whom a large amount of the discredit heaped on the old régime has rightly or wrongly fallen. Even in conservative monarchic circles there is strong feeling against the King and, while the people themselves are neither Republican nor Monarchist, there is at least, by all reports, a growth of anti-Alphonsoism in political and interested circles. How far this can be regarded seriously is difficult to say as Republicanism is against the instincts of the people and of the Church which strongly influences them. The Church apparently is not favoring a return to normal, constitutional government, as it fears that the moment of return will precipitate a serious national crisis involving the future of the monarchy. Nevertheless, even in Spain, a revulsion from the present entirely artificial and reactionary type of government is sooner or later inevitable, and those who have put their all on the military movement stand a big risk of losing it.

There is no doubt that although the mere issuing of decrees and reforms has given an appearance of progress and liberal government, this is far from true in fact. The Directory may have restored law and order; but it has completely killed any public opinion there may have been. It has increased public apathy. It has paralyzed political thought. Its attempt to form a political organization after the manner of Fascismo has completely failed.

The Directory has now only two tasks. It had them from the very beginning. Neither is nearly completed. One is the solution of the Moroccan problem. The other is the providing of suitable successors when the Directory decides to leave office. The Directory promised to solve the Moroccan problem. The army has always complained it was unable to succeed in Morocco owing to the interference of the politicians. After one year with the army in absolute control, there was a general rising of the tribes. Primo de Rivera maintains the ensuing gigantic losses in men, money, and material are the result not of lack of foresight on the part of the army, but of the previous mistaken policies of the politicians, and of a world Moslem awakening. He is now effecting a general retirement from the isolated posts in the Protectorate. He is withdrawing the Spanish forces to bases near the coast, from which he intends to police the interior by airplanes. Primo de Rivera has always had very sensible ideas about Morocco, being at one time an advocate of total abandonment. His saying is recalled, "Ceuta for Gibraltar, and to hell with the rest"; and though he has since modified his views there is no doubt his plan is the only reasonable one when all circumstances are considered.

The cost of putting the plan into operation in the middle of a general rising in which scores of positions were surrounded by the Moors has been enormous. There has been a minimum of information published. The losses have been exceptionally heavy. The country is embittered and silent. The silence is due to the repression of all manifestations of public opinion by the military. The French are sure to have something to say about Spain's semi-abandonment and the consequent exposure of the neighboring French zone. We are probably on the eve of another international Moroccan conference. The task is yet incomplete. Everyone in his heart hopes for its successful completion. But will the fact of having succeeded outweigh the responsibility which Primo de Rivera's enemies impute to him? There is no doubt he has done the old political régime less than justice. One of his chief criticisms was directed against their method of paying bribes to the Moors. It is this method which he himself has used during the last three months and on a far greater scale! Will he be forgiven?

Difficulty of Making a Graceful Exit

THE task of providing successors is just as difficult. The longer the Directory stays in power the more difficult it will be to leave it. Primo de Rivera himself has been trying gradually to slip out of the public mind by leaving Madrid to take supreme command in Morocco. Admiral Magaz is acting president of the Directory in Primo de Rivera's absence. The fact is no one wants the responsibility of taking over from the Directory, for the next government will have to submit to a measure of military tutelage. "There being no organization strong enough to stand out against the army, we must wait for the disintegration of the army itself before Spain's political picture can change," Count Romanones, the powerful liberal ex-Prime Minister, once said to the writer. That is the attitude of the banished politicians. Even though the prodigal wants to return to the constitution he spurned, no one can be found, so far, to sponsor him. The army is at the wheel: the country keeps a straight course. But what will happen when the army loses or voluntarily abandons control? There is no saying. At present Primo de Rivera is strong but, as Antonio Maura, the Conservative leader, said, at the time of the *coup d'état*, "The Dictator is like a man on a bicycle: he can keep his balance only as long as he can keep going."

There is a feeling in Madrid that we are on the verge of changes, changes which may or may not affect the dynasty. But too much attention must not be paid to prophecies of a revolution. The Spaniard's grievances or opinions rarely drive him into the streets. He takes things philosophically. He is the most patient, the most easily abused man in the world. He never interferes with the man who is governing him, however loudly he may complain. There is no national consciousness. The Spaniard lives in a badly governed country which has made tremendous material progress during the last forty years, and although the distribution of the wealth is very uneven, and there is misery and up to starvation among the very poor, he doesn't make much effort to improve his lot. Nevertheless this is the country of the unforeseen. Changes must come. There must at least come a reaction against military domination. The beginnings of an intellectual revival seen this century must sooner or later bear fruit. But the wary prophet does not believe immediate changes will concern any besides the King, the Church, the Politicians and the Army—and the Church and the Army if they are united can control any situation.

Natchez-Under-the-Hill's Lurid History

Concluded from page 3

with comparative ease. One side of the road is bounded by the perpendicular cliff; the other by empty air and a dizzy precipice, so that the unwary foot passenger involved amid the ascent and descent of drays, carriages, horsemen and porters, enjoys a tolerably fair alternative of being squeezed uncomfortably close against the bluff, or pitched with a somersault into one of the yawning chimneys on the flats below. There is no guard for the protection of passengers.

"From the summit of the hill, one sees the roofs of warehouses, stores and dwellings, scattered over a flat surface, which is bordered on the water front by hundreds of up-country flatboats, laden with the produce of the rich farming states bordering the Ohio, and 'Upper Mississippi.' Lower down, steamers are taking in and discharging freight, while the mingled sounds of the busy multitude rise like the hum of a hive upon the ear. Immediately opposite the summit lay two ships, which, with their towering masts, gay flags, and dark hulls, agreeably relieve the otherwise long and unbroken line of boats."

With the decline of river traffic, all of this gradually changed. The size of Natchez-Under-the-Hill was gradually circumscribed by the caving of parts of it into the river. And you hear of strange doings of the old-time vigilantes. How they fastened ropes about one of the buildings that housed unbearable evil, and with the help of a steamboat, dragged the building into the river. Again, you hear of patrols of vigilantes in Natchez, when the bad element of the place below the hill threatened reprisals, because the people of the city overhead attempted to clean up their river port.

Today, Natchez-Under-the-Hill is very quiet, indeed. The reputation of the place, however, stays green.

"When I'm away from home, and say I'm from Natchez," recently said one of that town's prominent citizens, "people immediately want to know if I'm from Natchez-Under-the-Hill. In fact, the impression everywhere is that the place is all there is to Natchez. Not long since, an Englishman sent a water-color painting of the place below the hill over here to see if somebody here didn't want to buy it. The picture was painted along in the 1840's, and taken over to England."

What you've just read concerns the part of Natchez-Under-the-Hill that has had the international reputation for more than a century. Respectable people also live below the bluffs. A mile and a half from the landing, for instance, privately owned gardens, which were part of a residence place, were noted the world over for their variety of plants, and their general magnificence. But this is not a story about their section of the town, which also went into the river. It escaped notice.

Europe Faces Cheap Transportation Enigma

Concluded from page 12

in evidence; perhaps too much so. It is used quite freely, to force horses, mules, oxen, donkeys, and even dogs to give speed and more speed; vain attempts, because their animal power cannot be increased at the will of the driver, and every extra effort must be at a cost offset by the earlier death or uselessness of the beasts of burden. One can stand at any crossroads in England, in France, in Switzerland, in Austria, in Italy, in Germany, in Belgium and at every one will there be evidence of drivers trying to whip an extra step, whip an extra jump, whip an extra foot of distance covered. They fleck the animals, often inhumanely, for speed, and then pull muscularly, almost to the point of breaking the animal's jaws, for a sudden stop.

In other words, the quick getaway and the short stop which only the light motor car can give efficiently, endlessly, dependably, is sought of animals that can never respond to these new exigencies of urban Continental life. The quick stop and the quick start, rendered so frequent and necessary by traffic regulations, have made the animal-drawn team less efficient than ever in congested districts.

Withal, in spite of these ocular proofs under their very eyes at all times, public officials still believe that the automobile is a luxury and are legislating it out accordingly.

Yet who can imagine the progress that must be Europe's, once it becomes thoroughly and properly motorized? Europe's roads have been famous for centuries, and their upkeep under new conditions can well be provided for by a just taxation policy.

There were 18,023,584 motor vehicles in the world, according to the Department of Commerce, in 1923, which are the latest figures available. Of those, 15,092,177, or 88 per cent, were in the United States. England had 642,853, Germany had 152,068, France had 444,812, and Italy had about 75,000. The number of persons per motor vehicle was as follows: Americans, 7; English, 74; Germans, 453; Italians, 490.

There is no question, based simply upon the known industrial advancement of Germany, that one car for every 453 Germans is an inconceivable ratio—an absurd minimum. There should be at least one car for every 50 inhabitants—and if the Germans were permitted to work out their automotive problems, without embarrassing sumptuary and duty laws, the American ratio would be very nearly equaled.

When the Cold Springs Stage Was Robbed

Concluded from page 11

hands on him till he was dead. A month later he was killed in a fight with a posse. I believe, if it hadn't been for McBride's influence, Cary would have led an honorable life. A finer, better man I never knew."

"How did you happen to get way up here in the mountains making snowshoes and so far from your old stamping-grounds?" I asked of the old plainsman.

"Well—" he replied, "it's this way. I wandered from the Hills through Colorado, New Mexico, Arizona, Utah, and from there up into Washington, prospecting a little and working out when my grubstake ran low. I heard of the stampede here to Kaslo and, of course, joined the rush. I worked in the mines till they petered out, then went to trapping. The mountains were full of marten, fisher, lynx, and bear. Beaver, otter, and muskrat were all along the waters. Snowshoes are an important item with the trapper, both for their wearing quality and the ease with which they can be handled in a rough country. I got hold of a pair made by a Siwash Indian. They filled the bill better than any I had seen.

"The following winter I made a pair just like them. Some of my friends used the shoes at times and liked them so well they insisted on my making a pair for each of them. As trapping began to play out, I relied more and more on my snowshoe business for a living.

"There's one fault in a snowshoe that tires a man more than anything else. It's the 'sagging.' When a shoe loses its spring, it becomes dead as so much sand. It took me three years to work out a hitch that would overcome that. With it I can apply such pressure to the maple bows that they can be crushed in.

"The bows are cut at the right time of year, then trimmed down, steamed, and put into forms for several months until there is no danger of their losing their shape. Many of them will check or split and have to be thrown away.

"For the thongs, two-year-old summer hides are used. Just the hair is taken off and the hide is nailed on the floor to dry. Then with a sharp knife, a string, three-eights of an inch wide, is started at the center and cut round and round, rather wide where the hide is thin, and narrow where it is thick, until I have a thong some two hundred feet long. It is soaked in water, then stretched across a frame with rocks piled on it in the center. This takes out some of the stretch. Then the rawhide is taken off the frame and soaked again and put back with heavier rocks on it. The process is repeated until all the stretch is taken out. It is then coiled and laid away. It is softened in water before being woven into the snowshoe frame as tightly as possible. Then the hitch is applied until it takes on a drumhead tightness. It is then soaked in a preparation that keeps out water.

"Never take snowshoes inside a heated room," the old snowshoe maker told me. "Leave them outside. Keep them away from the camp fire. Heat takes out the life of rawhide. When they have dried naturally, soak them in linseed oil. Don't try to walk on light, fluffy snow unless you are compelled to. Wait until it hardens. When you are traveling in snowshoes, don't hurry. Take a slow, out-swinging steady stride. You'll cover more miles."

The Kenyon snowshoe, as it is known in the North country, is a compromise between the old "bear-paw" variety and the long-tailed kind that is only good for clear going.

But snowshoes are not in demand as once they were. When I suggested that the diminishing snowfall of the past few years might be the cause, Mr. Kenyon replied:

"Maybe, but I don't think so. The surveying is all done around here now. That used a lot of my shoes. No prospecting is done now, except by a few old codgers that hole up when snow comes. The order-in-council at Victoria a year ago forbade all trapping of fur-bearing animals. They're not going to let us even kill a bear. Think of that!" the old man shouted as he brought his fist down on the table with a resounding whack. "Let me tell you this," he growled out as his eyes lighted up with the light of bygone days, "if I meet any old bald-face or silver-tip in the trail and he goes to curling up his snoot at me—there's going to be a fight right there, and it's not going to be Ralph Kenyon that goes down, either."

The mood he displayed is quite typical of the old-timers. Their minds, becoming fixed with the habits and conditions of a half-century ago, continue to resist modern laws and customs, be they good or bad. Like the shaggy grizzly, they resent the encroachments of civilization and retreat farther and farther to some secluded place to spend the evening of their eventful lives, where only the distant echo of the new order of things will penetrate their solitudes and disturb their dreams.

Stories From the Woodland Trail

By D. LANGE

THE mink is one of our few fur bearers that have held their own since the country was settled by white men.

Its long, slender body is well adapted to find shelter along streams and lake shores. Every creature, if its kind is to persist, must find shelter from its enemies, and shelter for raising its young.

The mink's diet is quite varied. Fish, frogs, and crayfish are its mainstay, but birds and small game are by no means refused.

In addition to these strong points for keeping a hold on life, the mink possesses several others not so well known and understood. A young trapper friend of mine, who has observed and trapped mink for years, believes that the females practically hibernate for about three months during winter, because he catches no females during that time in places where they are found toward spring. This habit by reducing the hazard on the life of females would tend to preserve the species.

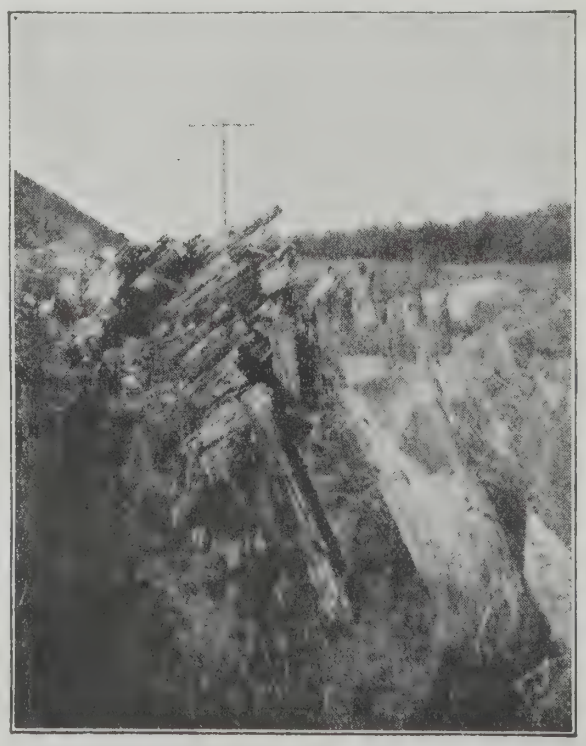
Although the mink is short-legged, it is no mean traveler. I know of one mink who traveled, over fresh snow, three miles in one night. It went from a wooded river bottom over an open prairie to the shore of a large lake three miles north, and the straightness of its course indicated that it knew where it was going. Perhaps this was not the first time it went over this trail, a long trail for a mink.

This ability and boldness of travel would secure a stock of minks for every suitable locality, which accords with the facts as found over the continent. For the mink is at home practically over the whole of North America north of Mexico.

A trapper friend of mine once made an observation on the habits of the mink, and discovered a habit which is probably common with the species, but which does not seem to be generally known. My friend found in the month of November the winter provision cache of a mink in a large hollow root near a river bottom lake. Enough food had been collected in this cold-storage cache to enable a mink to live at ease during the longest winter. The cache contained: Twenty small carp, from ten to fifteen mud hens, thirty wild ducks, and a few small birds.

The quantity of food in the cache is still more remarkable, when it is remembered that a large male mink weighs only a little more than two pounds, and a female less than two pounds. The food in this remarkable cache must have weighed between forty and fifty pounds.

The ducks and mud hens had undoubtedly been either killed or wounded by hunters, and the provident mink had picked them up dead, or had caught the crippled birds when the lake began to freeze up. White hunters in this way no doubt furnish to the mink nowadays a large part of their autumn and winter food.



A family of minks lived under the old ties all summer.

The Miracle of Water

Concluded from page 9

over to lift her jar to her head like the "woman at the well" with whom Jesus spoke. She was shy about being photographed. After she filled her earthen jar she got down on her knees and let the water play on her back, and then throwing herself back on her hands she let the cool water play over her breasts. It was a beautiful picture.

My missionary friends tell me that this is the common bathroom of the village, and that one of the favorite "outdoor sports" of the foreigner is to flash his searchlights on the artesian wells at night and catch the Rembrandt pictures of naked natives bathing.

"I never saw such green fields!" I exclaimed to a friend as we drove along the highway around Manila Bay into the province of Balacan.

"It makes me feel as if I'd like to get out of the auto this hot day and lie down in that beautiful green freshness."

It was a picture I shall never forget. Great palm trees reared their feathery crests, and graceful bamboo trees rose amid these stretching green fields.

"That is young rice. It is the most beautiful green in the world, but it could never be done if it were not for the beautiful gift of water. That rice has to be planted in several inches of water," he said.

From each of the artesian wells, streams run down along the village streets. Men dip water from these streams and with long gourd dippers throw it on the dusty roads. There are no water wagons to sprinkle the dusty germ-laden highways in the provinces as there are in Manila, but these gourds in the hands of a skillful native can scatter this refreshing water over the entire width of the narrow Philippine road with one sweep. It is always a joy to run over a stretch of such watered roads in a village, for the evaporating water makes the air cooler by several degrees than the untouched and unwatered roads. Many times on a hot, blistering, dust-choking ride I have thanked God for this blessing of roads cooled by evaporating water from the artesian wells.

I have thought of beautiful Salt Lake City with its mountain streams running through the streets as I have traveled through Philippine villages where the overflow from these artesian wells sent a cool, clean stream all through the village.

And contentment! "What is contentment?" do you ask. I shall tell you. It is a dozen great carabao; that half-cow and half-buffalo beast of burden used in the islands, taking his daily plunge in a great pool of water along the road made by the overflow of the wells; with a brown boy on his broad back pouring water over his black hide; both of them perfectly happy; both of them looking like statues; both of them unmindful of time.

"What is a Georgia cracker?" a visitor once asked a native in Georgia.

"Well," said the native, "do you see that stump up there in the fields?"

"I do," replied the visitor.

"All right. You watch that stump for half an hour and if it moves its a Georgia cracker and if she don't move she's a stump!"

And that's about the way a big black carabao with a Filipino boy on his back looks, when settled down in a pool until only his great horns, eyes and nose are above water.

I am told that these beasts of burden will do well only when they have their daily mud or water wallow. The more mud the better they like it. If they are denied this wallow they go crazy with heat, and one can well believe it by seeing them as they tear wildly into the depths of a river or a mud hole or a creek when they are loosed from their cumbersome carts.

After I had come to know the islands better I understood what my educated friend the Filipino meant, when he said seriously and thoughtfully that the greatest thing America had contributed to the islands was water.

To the Filipinos these wells mean more than a system of government, more than schools, more than independence, more than great systems, more than automobiles and electric lights and street cars and railroads and health reports; all of which have been introduced by the Americans during the last quarter of a century.

Jerusalem in a Snowstorm

Concluded from page 4

Jewish shops from sunset Friday till very late on Sunday. The Moslems have turned Friday into a day of rest, just to show that they have no grudges. Then there are all the feast days and fast days of the Christians: Greek, Latin, Jacobite-Syrian, Monophysite-Armenian, Abyssinian, and Copt, Nestorian-Assyrian and Maronite—not to mention duplications through differences in calendar—and those of the Moslems, Sunnite and Shi'ite, and of the Jews, of whom alone there would seem to be all the fifty-seven varieties that met at Pentecost. Of course, the various consulates of the nations observe all their national holidays, and some of them have a great many. As the consulates, government offices, and banks employ persons from many of these persuasions, there are left probably fewer honest-to-goodness working days in Jerusalem than in any place under the sun.

With what contempt the wild Arabs from east of the Jordan—free, graceful, strong with the fresh air of the desert, and browned by the sun—look down upon the denizens of the city. In their own country any one of them might come to your tent in the night, steal your horse and take your life. But here they fear having their pockets picked. By the Jaffa Gate sits a poor creature, age and sex undiscoverable, blind, with mouth agape, tongue lolling out and covered with flies. It cries "Ya Kareem! Ya Kareem! O Generous One! O Generous One!" The senses have no relief. If these Bedouin Arabs were tempted to remain here rather than to return to the rigors of the wilderness, their own children would become as the city folk; for all Arabs are the posterity of the Bedouins.

Thus Jerusalem-of-fact remains: a moldering museum of biblical antiquities, a place of pilgrimage, a home for dreamers. Such it has been since the Emperor Titus razed it in the year A. D. 70.

Nativism as Manifested in the Fifties

The "Know-Nothing" Movement in American Politics and Its Effects; Attempt to Stem Immigration Current—Kossuth's Fervent Appeal

By LEWIS WORTHINGTON SMITH

IT IS now nearly three-quarters of a century since the development of a movement in American politics at which we have more or less smiled for the greater part of that time. In the fifties it looked as if a secret organization which came to be called the Know-Nothing party might elect a President of the United States on the basis of principles very much like those of the Ku Klux Klan of our day. In the campaign of 1856 its candidate was Millard Fillmore, who had already been the chief executive of the nation. Fillmore was not one of our great Presidents, but also he was not a fanatic. His temper was naturally conservative. His identification with any party is something of an assurance that its objects, whether wise or unwise, were at least not irrational.

In a democracy open diplomacy is recognized as a thing of some importance. No less does it seem necessary that questions before the public should be open for discussion, should be debated with free expression of various opinions, and should not be decided arbitrarily behind closed doors. Even more certainly should those who are punished for offenses against society be accorded a public rather than a private judgment of their fault. They should not be compelled to suffer indignities at the hands of judges who give them no opportunity for defense. In his life of Lewis Cass, Andrew C. McLaughlin writes thus of the Know-Nothing party: "No 'order' having an hierarchy and degrees, and encumbering a political topic with paraphernalia and mystic symbolism, can rise to dignity in a free country and dominate a frank and thoughtful people, the very essence of whose institutions is common participation, common undertaking, and common judgment."

Rise of the Know-Nothings

THE Know-Nothing party, beginning very obscurely in 1850, by 1854 had become strong enough to cast one-quarter of the total vote in New York State and only a little less than two-thirds in Massachusetts. To Whigs and Democrats both that was an ominous growth, and yet in the Presidential election two years later Fillmore carried only one state, Maryland. Almost at the moment of the discovery of this result the party was swept out of existence by the rise of the Republican party. The anti-slavery agitation was now at its height, and the anti-foreign, anti-Catholic sentiments of the day were lost in the more intense passion. The brief career of the American party was over.

It can hardly be said that the movement accomplished anything in the direction of its purposes. Probably it must be looked upon as one of the futilities of our history. As far as it has any significance at all we shall perhaps have to see that significance in the mere fact of its existence and in the influences that brought it into being. When such an organization can make so rapid a progress in so short a time it is a safe conjecture that something is seriously wrong. It may be very foolish for a man to pull out a tooth to relieve an attack of toothache. A dentist acting in agreement with some of the established rules of conduct of his profession might do better for him. His foolishness, however, is not a demonstration that he does not have the pain that he thinks he has. It rather confirms it as giving a reason for his lack of self-control.

Hostility to Immigrants

BY THE census of 1850 the population of the United States was slightly more than seventeen millions. Immigration had been steadily increasing. In 1854, the year when the American party attained its largest influence, the number of immigrants reached the total of 427,833. In proportion to the population of the country then, that was the equivalent of an immigration quota for our day of three million aliens coming to take advantage of a civilization that they had not developed, to which it was reasonably believed that in the main they would not adapt themselves, and within which they could not be expected to become a homogeneous part. It drove men of the older stock into some violence of resentment. Everywhere and in all times men born to the assertion of personal freedom under the reign of law will protest in whatever way they can when they feel that they are in danger of being dispossessed. It is the business of any government to protect its citizens in their rights. No right, in the general and large rather than in the immediate and personal sense, is more important than the right to the preservation of our social ideals. Here in America they are probably not as comfortably free and easy as those of the South Sea Islanders, but we are none the less disinclined to have the manners and ways of life of other peoples, however intrinsically charming, imposed upon us from outside.

Kossuth's Appeal

IN 1852 Louis Kossuth, the Hungarian patriot, came to the United States in some measure as a guest of the nation. He had been liberated from a Turkish prison in part through the good offices of the American Department of State. In the course of his diplomatic representations on the subject, Daniel Webster, then Secretary of State under the Presidency of Fillmore, had aroused the bitter animosity of Hülsemann, the Austrian minister to this nation. American sympathy for Hungary as suffering under the unscrupulous tyranny of Austria was generous and widespread. The question of American intervention for the protection of an oppressed people was in the air. Webster was warmly responsive to the Hungarian cause, as was also President Fillmore, but they did not see fit to recognize Hungary as an independent nation. That they should consider that possibility at all, however, that the American Government should dispatch a committee to Hungary with that in mind, and that it should be instrumental in the release of the Hungarian leader so angered Hülsemann that finally he left his post and hastened home.

At the time of Hülsemann's withdrawal, Kossuth had already been brought to the United States in a national ship, had been received with noisy demonstrations of welcome, and had addressed audiences in many American cities. Carried on a wave of excitement from one part of the country to another as he was, he yet was forced to become increasingly conscious that the government would take no formal action in support of Hungarian independence. Seeing that the native-born were not inclined to forget Washington's advice and embroil themselves in foreign affairs, Kossuth appealed to those of foreign birth. Speaking to an audience of Germans in New York City in 1852, he said:

> "You are strong enough to effect the election of that candidate for the presidency who gives the most attention to the European cause. I find that quite natural, because between both parties there is no difference as regards the internal policy, and because only by the inanity of the German citizens of this country, the election will be such that, by and by, the administration will turn their attention to other countries, and give every nation free scope. No tree, my German friends, falls with the first stroke; it is therefore necessary, that, inasmuch as you are citizens, and can command your votes, you support the candidate who will pursue the external policy in our sense."

Again in a secret letter issued later he said in the same vein:

> "Indeed, it is not easy to be mistaken, that the German citizens of America will have the casting vote in the coming election, if they are united in a joint direction upon the platform of the principles set forth in the speech before mentioned.
>
> "They may decide upon the exterior policy of the next administration of the United States, and with that the triumph or the fall of liberty in Europe."

The Foreign Vote

IF AMERICANS had not been alarmed by this effort to control their country by aliens in the interest of aliens, they would not have been deserving of the liberty to which they had been born. At this time the current of immigration was at its height. Approximately one person in forty in the United States had come into the country within the preceding twelve months. That the vote of the alien might easily have a determining effect upon national policy, as Kossuth had declared, must have been easily apparent to every thoughtful man acquainted with the facts.

In a letter to a friend dated January 3, 1855, the year of his identification with the American party, Fillmore wrote in part:

> "I have for a long time looked with dread and apprehension at the corrupting influence which the contest for the foreign vote is exciting upon our elections. This seems to result from its being banded together, and subject to the control of a few interested and selfish leaders. Hence, it has been a subject of bargain and sale, and each of the great political parties of the country have been bidding to obtain it; and, as usual in such contests, the party which is most corrupt is most successful. The consequence is that it is fast demoralizing the whole country; corrupting the very fountains of political power; and converting the ballot-box into an unmeaning mockery, where the rights of native-born citizens are voted away by those who blindly follow their mercenary and selfish leaders."

Blind Humanitarians

THE maintenance of a definite policy of any sort in a society of any kind is dependent upon the existence of a reasonable degree of homogeneity, of unity of purpose, in that society. The purposes and aims of Germans in Germany with relation to Hungarian independence or any other problem must be recognized as being quite within their legitimate province. They may there properly think and act as they wish. People of alien origin, maintaining their native character in America, are not properly privileged to decide the course of American governmental action in agreement with their personal national or international sympathies. They may by naturalization have some legal right so to conduct themselves. From the standpoint of those who have originally determined the character of their adopted country, however, they presume upon a courtesy. The ideals of life that bring happiness to men and women in Moscow, in Pekin, in Budapest, are not the ideals that bring happiness to men and women in America. The pursuit of happiness in the United States is not the same as the pursuit of happiness in Vienna or Montevideo.

When we are confronted with a surge of nativistic violence, we should realize at once that the real authors of it are the blind humanitarians whose sentimentalism has opened the door to those who are not our kind. A political experiment, whether communistic, Republican, or Democratic, has as its end the social good of those who engage in it. A political end is incidental only, not final. The house that I build for my inhabiting is justified in the beauty of its architecture, however fully it achieves that beauty, only in the event that it shelters peace and tranquillity. If I cannot live within it a life that in some measure satisfies my nature, I must feel ultimately that all the thought that I have given to it has been in vain. Certainly if I must grant harborage to every comer whose manners are wholly different from my own, whether better or worse, I can scarcely escape some bitter regrets.

A Vanished Dream

WHEN we built our political house some century and a half ago, political ends were probably much more singly in our minds than they would be now. We cannot with as good an intellectual conscience in our day think of achieving a unity of aim by bringing together a miscellaneity of peoples. That was a dream of enthusiasts. It has vanished. We have come to see that more than one great civilization has been wrecked by a process of hybridization. When in the place of debating about means toward a common end, we must disagree about ends themselves, we are on the road to ineradicable animosities. There is a story of a man whose wife, from visits to a settlement house in the neighborhood, learned some better ways of preparing food and began practicing them in the kitchen. Theoretically he approved of them and expressed his approval generously. His final judgment as a thing of personal application to himself, however, betrayed a slight variation of opinion. "Them's good things they learn you to cook over there," he said, "but I'd ruther eat what I'd ruther." That is very much in the spirit of the founders of our civilization, and most good Americans are still individually in the same state of mind.

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

"The true test of civilization is not the census, nor the size of cities, nor the crops; no, but the kind of man the country turns out."—*Emerson.*

The life insurance companies have more than doubled the amount of their loans on farms in the past five years. Farm mortgages have increased from $859,000,000 at the end of 1919 to $1,781,000,000 on September 30 of this year.

Radio rash is said to be the newest affliction of the people of Europe. It is an eruption of the tender skin of the ears, resulting from the constant pressure of the hard rubber headpieces. Dr. Marcus, of Vienna, mentioning it in the *Clinical Review,* says that it is not serious when given prompt attention.

"Education is good behavior to the young, comfort to the old, riches to the poor, and decoration to the rich."—*Diogenes.*

The number of words found in old English literature does not exceed 30,000, while the new dictionaries today have listed more than 400,000, mostly of foreign origin. It is strange to note, however, that most authors use mainly English words. Shakespeare used 90 per cent and the English Bible contains 94 per cent.

A bill has been brought up in the Danish Parliament by Minister of Justice Steincke which would authorize doctors under certain conditions to take the life of a person who was hopelessly ill and who desired it, without incurring punishment. This according to the old law was designated as manslaughter or murder.

Antisthenes when asked what was the most needful branch of learning answered that it was to unlearn one's bad habits.

What is believed to be the only troop of blind Boy Scouts in the world is Troop 254 of the [illegible] composed of fourteen boys.

Five thousand young Christmas trees will be contributed by the New York State College of Forestry at Syracuse University to each county in the State of New York that will establish a Christmas tree farm.

The expression "blue blood" is of Spanish origin, where the aristocracy was limited to those who traced their lineage beyond the Moorish conquest. Having whiter complexions, the veins upon their hands were blue ("blue blood"), while Moorish blood showed black upon the hands and temples. The phrase passed into France, where it gained vogue, and from there to England and America.

When a dead seal is brought home by an Eskimo hunter the body is ceremoniously treated to a drink of fresh water in the belief that all his life the seal has been craving a draft of sweet water. The hunter who satisfies this longing puts himself on good terms with the seal's spirit and through it with the spirits of seals still living. This, he thinks, makes for luck in hunting.

The Indian name Shenandoah means "Daughter of the Stars."

One of the ordeals a boy of New Guinea has to go through is a number of days of starvation, during which time tempting food is brought to him at intervals. If he betrays the least emotion at the sight of the food he is considered lacking in self-control and is sent back among other boys for another period of time.

Someone asked Diogenes why people gave money to beggars and would not give it to philosophers. He replied, "Because they think they are much more likely to become beggars than philosophers themselves."

After many centuries Swedish menfolk are beginning to milk cows. They formerly waited by while the women milked.

"No reform would be effected if tip-taking were forbidden and salaries raised, for the ban would be ignored by both employes and patrons of hotels. The public will tip, and tips will be taken, no matter what the salaries and wages are."—*H. M. Statler,* of the Hotel Pennsylvania.

"The Bible is a book of faith, and a book of doctrine, and a book of morals, and a book of religion, of special revelation from God; but it is also a book which teaches man his own individual responsibility, his own dignity, and his equality with his fellow man."—*Daniel Webster.*

The Irish River Shannon, famed in song and story, is about to be harnessed to produce electrical energy for the industry of New Ireland.

The *Evangelical Christian* and *Missionary Witness,* of Toronto, says editorially: "It would be well for every Jew if he would carefully read the books put forth by Mr. Henry Ford, which were originally intended to provoke the Hebrew people to bring about reforms among themselves."

Domestic reindeer herds in Alaska are today worth $1,550,000 more than the United States paid to Russia in 1867 for the entire Territory.

Thirty million copies of the Bible were sold last year.

A church wedding does not constitute full legal marriage in Germany. It is preceded by a ceremony at the office of the Justice of Peace.

The oldest public document ever presented in the courts of Queens County, New York, so it is said, was a deed dated August 16, 1685, recently brought into the courts to settle a land dispute.

The oldest of all pyramids antedating the great Gizeh group by between 300 and 500 years, is the step pyramid of Sakkara, twelve miles south of Cairo.

Of the 52,000 names of towns and post offices in the United States, forty-three appear more than twenty times each.

"I Read in the Papers—"

I READ IN THE PAPERS that a great function was held in the Halls of Congress on December 15, in memory of Woodrow Wilson, but was not told what was the occasion for this. I read a New York, Detroit, Chicago and Boston newspaper and failed to learn why the memorial service was held just at this time. A Wilson memorial is always fitting, but as a newspaper reader I wanted to know *why* this meeting was held *now.* I wanted to *know badly enough to search four newspapers. None told me why.* (I have just met a man from Washington who tells me that it was the customary memorial service held after a President's death, and that a similar service will be held for Mr. Harding in March or April.)

I READ IN THE PAPERS that Louis Marshall broadcast over WGBS recently that 5,000 Jews were in Cuba, having been lured there by steamship agents. Mr. Marshall's purpose was twofold, first to make immigration into the United States easier for his fellow Jews, and second, to get $500,000 out of people who can be made to believe that all governments treat emigrant Jews badly. The facts of the Cuban matter are these: there are many Jews in Cuba waiting to get into the United States, and numbers of them will be bootlegged in—no question about that. But there are not 5,000 Jews there, and those that are there have not been 'lured" by steamship agents. They have come in pursuance of a perfectly well understood plan. Every one of them has seen in the offices of American Consulates in Europe—offices which they must and do visit—the posted warning not to leave Europe with the intention of entering the United States without first obtaining American visas in their home country. The American Counsel General at Havana, Cuba, can tell Mr. Marshall that rarely does there arise a case in which the Jewish emigrant has not gone to the American Consul in his home town before coming to Cuba and has learned the true conditions; nevertheless he comes to Cuba. Moreover, living conditions of the Jews in Cuba, which Mr. Marshall describes as "comparable only with the Black Hole in Calcutta" are so much superior to living conditions of Jews within a few blocks of Mr. Marshall's palatial New York home, that the comparison is as that between heaven and hell.

I don't like to see both Jews and Christians imposed upon by such statements. If it continues, the Jewish Sanhedrin in the United States will have to get another spokesman.

I READ IN THE PAPERS that the former Kaiser of Germany charges the United States with making a secret agreement with England, France and Japan against Germany in 1900. When simple affairs are still so confused ten years after 1914, how confused they must have been at that date. How little the world seems to know about itself, anyway! How much misinformation the best secret service in the world can gather! Still, Mr. Hohenzollern should use his common sense in such matters. When even a public agreement, such as President Wilson wanted to make, was impossible, how could a secret agreement become possible? Who could make it, and who would be bound by it, and would the maker be in office when the day of fulfillment came round? Nonsense! Add to the list of American liberties our absolute freedom from "secret" promises, understandings, alliances, treaties.

I READ IN THE PAPERS that mankind is growing handsomer. There is not the slightest doubt of it. As justice becomes more and more the rule of life, and the possible privileges of life become more general, life becomes more rewarding and as a consequence is lengthened. The average life is longer now than in any period of which we have scientific statistics. This seems to disprove what everybody was saying a few years ago, that the nervous pace of today kills. The increase in the number of interests gives life. People used to be old at 60; they are just in their prime at that age. Our cities are full of young old people. The reason is doubtless mental. The true cause of old age is the hardening of the mental arteries. The stage of "old fogeyism" is pushed very far back in our day. Besides, medical science, which years ago was intent on saving the babies, has made such creditable advance in that field that it is now devoting itself to the hygiene of maturity and age. All this reflects itself in people's faces. Of course we are better looking than our ancestors, and when our descendants have accustomed themselves to the new vibration of life they will be better looking than we are.

I READ IN THE PAPERS that the "municipal ownership" cry is subsiding in the United States. The probable reason is that, good as it is as a theory, it does not work out in practice. Men who are competent to run great enterprises are not in politics, and if they are hired to run municipal utilities they are too much hindered by politics. One very bad feature of municipal ownership is that newspapers seldom tell the people the full truth about it. One good feature of private operation is that newspapers will jump on a corporation at the least deviation from service. It is a sad condition when newspapers cease to be watchdogs of the public welfare and become silent accomplices of public incompetence in municipal operation. But, whether privately or publicly operated, public utilities should be strictly amenable to general public control. Every franchise should stipulate that. And in municipal ownership, taxpayers should be informed how much of a deficit they are making up.

MR. FORD'S Page this week (page 7) discusses the cost of government, with emphasis on the tendency of "paper work" to increase, and the bad financial policy which keeps the Government poor paying interest on its own money.

AMONG the feature articles in this issue is an interview with William Allen White (page 3) who is being honorably reckoned as a writer of insight and craftsmanly skill. American in taste, tone and technique, he will more richly repay the attention of young men than do flashier aliens or even native-born writers who ape the alien psychology. Mr. White lives in the Editorial State—otherwise known as Kansas.

SAID a man recently, "There are only two birthdays universally celebrated; one of them falls on the 25th of December, the other on the 25th of January." Candidly, we had to ask what the latter date signified. The birthday of Robbie Burns, of course! An American abroad sends us an illustrated description of the Burns Country as he saw it (pp. 12 and 13) and a Scottish journalist, tells (page 15) how Burns refused to pledge the British Premier, saying, "I propose the health of George Washington, a Better Man."

AMERICANS, Attention! There are 115,000,000 people in the country, and 7,403 members of State Legislatures. The Constitution of the United States can be changed by a majority of the legislatures in three-fourths of the States. That majority happens to be 2,316 members. *Therefore, 2,316 men can change the Constitution of the United States.* Did you know that? Read the article on page 4. The latest proposed Amendment concerns the *children of the nation*—not the children out West or down South, or up North, but yours and mine. And we have nothing to say about it—not a vote, not even a vote of instruction to the men who will vote.

WHY don't they want the people to vote on these questions? You will see why, on page 5. Legislatures are more easily handled. How do women propagandists handle legislators? Read their own descriptions of how they do it.

AN EDITORIAL on the Tax and Interest burden (page 8) deals with a matter that the whole nation will be roused about soon.

Shopping—and in China, too! An American lady tells how she did it—page 6.

How do Presidents act and feel at the solemn moment of their Inauguration? Tom Masson opens a door into the secret—page 2.

The best-dressed women in Paris are Americans wearing American-made dresses. When we put our *mind* to *styles* we proved as smart as the French. And as Jean Mowatt tells it, on page 10, even a man would enjoy reading it.

Pure American atmosphere and color, though of different shades and types, in "Medicine Shows" on page 9, and Lake Placid in winter, on page 11.

YANKEE Common Sense—flavorous with wisdom, fibrous with strength, something to draw a whoop from Father and an approving smile from Mother. Find it—Read it—Revel in it—At the bottom of pp. 4 and 5. Even an American boy will feel his blood saying "Yes" to it.

The Human Side of Our Presidents

How They Felt, Acted and Were Described at Their Inaugurations

By THOMAS L. MASSON

THE Presidential inauguration is almost an unofficial ceremony, which time and custom have standardized. Yet in the past it has been the occasion not only for great emotional displays, but for the revelation of human traits in our chief magistrates, which throws an illuminating glow upon the whole presidential succession. This year on March 4, at the end of 135 years of our national life, it is Coolidge who will be inaugurated.

From a two-family house, after a preliminary hotel career of chafing dishes cooked by his admirable wife, he arrives at the White House. He sets his individual example of economy in all sorts of ways—by speech and practice; refuses to ride in a private car, and plays up to the national hay-raking complex with grand diplomatic skill.

Washington—agitated and embarrassed.

Way back at the other end of the line, we have George Washington, then accounted the richest man of his day, obliged to borrow $3,000, to journey to New York to be inaugurated.

In Rome they had a custom, when a military victor returned from war triumphant, for a man to stand behind him in the chariot in which he sat in processions, and repeat occasionally in his ear: *"Remember that you are only a man."* It is recalled that Napoleon, as he stood waiting to be crowned, turned quietly to his brother and whispered: "What would father say if he were here?"

The thing which really separates the line of our presidents from all other rulers—if we may judge from their remarks at their inaugurations—is the entire absence of vanity. These presidents of ours have, indeed, been sadly deprecated. It seems to be assumed that, as a whole, they must be mediocrities. Yet it is difficult to say how, in any given instance, they could have done much better, and when we come to examine it, it is astonishing how, in so many instances, they seemed to be specially designed to fill the bill. This is certainly true of Lincoln; and it may be true of Woodrow Wilson.

I was told only the other day, on very high authority, that Rudyard Kipling had got the inspiration for his famous poem "If" from a study of the character of George Washington, who was probably more severely criticized by his contemporaries than any other man in the world—and who was more unmoved by it than any other man.

Another interesting thing: It is a fact that the large majority of our presidents didn't want the office. The rule seems to be that those who went out for it hardest and wanted it most didn't get it. Before Washington came to New York in 1789 to be inaugurated, he wrote to Henry Knox: "My feelings are not unlike those of a culprit going to a place of execution." And later on Thomas Jefferson remarked at his own inauguration, after he had been congratulated by a friend: "I would advise you to follow my example on nuptial occasions, when I always tell the bridegroom I will wait until the end of the year before offering my congratulations."

Cleveland riding back to White House with McKinley.

The inauguration ceremony itself has no official sanction, the Constitution merely prescribing that the President shall take the oath of office. He is not even formally notified of his election. But the manner in which it has been celebrated—the parades, the military displays, balls, pageants, and so on—all make it a very accurate barometer of the state of the nation. At this moment we need to put ourselves quietly in the place of the incoming President, not alone considering his feelings and emotions, but his responsibilities; this will help us to understand not only what we are here for individually but what the country is here for. We must get at the thing from the inside, rather than from the outside, and the inaugurations offer us a rich field for the inside.

There was, for example, Grover Cleveland riding back to the White House with McKinley, just elected on March 4, 1897, and remarking as quoted: "I am deeply sorry, Mr. President, to pass on to you a war with Spain. It will come within two years. Nothing can stop it."

Now war with Spain was not apparent to the superficial observer at the time. But it came according to Cleveland's prediction.

Another thing we get is a sense of similarity in the attitude of our presidents toward foreign powers and the European question generally. For instance, on March 4, 1845, President Polk delivered—in the pouring rain—the famous inaugural address relating to Oregon, which caused such a controversy in Great Britain, and which may be compared with Grover Cleveland's equally famous Venezuela message of December 17, 1895. This latter was not, of course, an inaugural message, but after a lapse of nearly fifty years it is very interesting to note the same prevailing tone. I recall quite vividly a friend of mine who was a large operator in Wall Street, berating Cleveland the next evening after the Venezuela message, because it had ruined him, stocks falling with a dull thud on that morning. Thus the patriotism of Wall Street is always in evidence!

It should be understood that, in this article, I am making no attempt to present a set display, or formal chronological review of presidential inaugurations. My purpose is to interest everyone in the office itself as a keynote to the real secret of our government. But that the reader may follow the line, I have appended to this rambling account a table of presidents with the proper dates; and this will be found a convenient reference card.

The difficulties attendant upon the first inauguration seem now almost incredible, compared with the ease we now get about. I am writing this article almost within a stone's throw of where Washington embarked (Elizabethport, New Jersey) for New York on his triumphal journey from Mount Vernon in 1789. This first inauguration of George Washington was duplicated as closely as possible a hundred years later, during the administration of Benjamin Harrison, in 1889, and, as one of the spectators of that great occasion, I well remember the extraordinary ceremony, the enormous excitement and the great crowds—which, however, would not be so considered today, so congested has the Metropolis now become. One monument only remains of that occasion—the Washington Arch, at Washington Square, under which, every day, a long succession of Fifth Avenue motor buses continues to parade.

Washington was not inaugurated until April 30, 1798, the delay being due to the fact that it was not possible, on account of the weather and the roads, to get a quorum of Congress. The assembly of the first Federal Congress, after the adoption of the Constitution, was fixed for March 4, 1789, but only eight Senators and thirteen Congressmen arrived—not enough for a quorum. At that time the Raritan River at New Brunswick—which now one speeds over in a motor in a few seconds—and the Delaware River were both crossed in scows. Travel was so impeded that not until April 6 was a quorum present. They met and organized on that day.

On the morning of April 16 Washington left Mount Vernon. He rode on a white charger. A laurel wreath was placed on his head at Gray's Ferry by one of the Boy Scouts of that day and at Trenton thirteen beautiful young girls strewed flowers in front of him. At Elizabethport he was received by a committee of Congress and the mayor of New York, at that time a city of not more than 25,000 inhabitants. The landing from the barge, decorated for the occasion and which had proceeded across New York Harbor from the Kill von Kull, was made near the foot of Wall Street, only a short distance from where, many years later, Jenny Lind landed, escorted by the redoubtable P. T. Barnum. The official residence of Washington in New York was known as the Walter Franklin House, and was occupied by Samuel Osgood of the Treasury Board, who moved out bag and baggage for the Father of His Country.

The ceremony itself, which took place on the site of the present Sub-Treasury building at Wall and Broad streets, was quite elaborate. Some authorities state that Washington was elaborately dressed, but the fact seems to be that he was the first to establish the precedent of wearing American-made clothes.

"He wore," says Rider, "a complete suit of homespun so finely woven that it 'was universally mistaken for a foreign manufactured superfine cloth.' Other officials offered the same token of attention to the manufacturing interests of the country."

Thus we see that in the very beginning of our career, the fact that "business is business" was not neglected. President Coolidge is by no means so far afield as a practical man as some idealists would have us believe.

Which at the moment reminds me of a remark Woodrow Wilson once made to me when he was governor of New Jersey. He said that he had a hard time getting away from cranks and other nice men who took up his time, so he finally got a room way up, I think on the top floor of the capitol at Trenton, where he and Joe Tumulty began their combined official careers. And Washington, way back in 1789, had the same experience. He had been accused of holding himself too much aloof, indeed, of being a kind of presidential snob. He made a protest against this public censure. In this he declares that before he introduced system into his callers, he was "unable to attend to any business whatsoever; for gentlemen, consulting their convenience rather than mine, were calling from the time I rose from breakfast—often before—until I sat down to dinner. This, as I resolved not to neglect my public duties, reduced me to the choice of one of these alternatives—either to refuse them altogether or to appropriate a time for the reception of them."

William Henry Harrison made address in storm which hastened his death.

And he adds: "To please everybody was impossible."

At the time Washington was inaugurated there was a distinct smart set in New York. The inauguration ball, if thus it can be called, took place apparently on May 7. Washington, who, unlike President Coolidge, had learned to dance, performed a minuet with Miss Van Zandt and also danced cotillions with Mrs. Peter Van Brugh Livingston, Mrs. Maxwell, and others. His second inauguration was held in Philadelphia. He wanted it to be private but the Senate insisted on its being public.

Douglas stepped forward and took Lincoln's hat.

Nothing could be in more startling contrast to the first inauguration of Washington—and, indeed, in a sense to the second—than the inauguration of John Adams, one of the greatest cranks, and one of the greatest men, this country has produced. John Adams had enough vanity to keep his family successors supplied for generations; and those of the direct descendants who are going about today are not notable for their lack of it. Washington had, in a very large sense, come into his own. The country mourned his departure. "Many wept," says a contemporary, "when he left the hall of the Old State House in Philadelphia and spectators followed him in crowds." Adams, who apparently resented this, wrote: "There was more weeping than there ever had been at the representation of a tragedy." And he added his doubt as to whether this was more "from grief for the loss of their beloved President or because of the accession of an unloved one." This last sentence, by the way, is the motive of that remarkable book written by his present-day successor, Henry Adams: "The Education of Henry Adams"—a kind of cultured pean of self-pity.

The inauguration of Thomas Jefferson, which took place on March 4, 1801, was the first inauguration to be held in Washington, to which city the seat of government had been removed in 1800. Here the sinister figure of Aaron Burr emerges into processional publicity. Adams hated Jefferson and refused to be present, leaving Washington the night before. He had appointed John Marshall Chief Justice, and Jefferson hated Marshall, who performed the ceremony of administering the oath. Burr hovered about like Mephistopheles. The thing was got through with. Jefferson was living at a boarding house (Conrad's) at the time, and living was so crude that he was the only boarder who had a whole bed to himself. At that time the north wing of the Capitol was not completed. Jefferson, walking between Burr and Marshall, was escorted to the room at present occupied by the Supreme Court. He had come to the Capitol escorted by a battalion of soldiers. When the affair was over, he went back to his boarding house. He did not get into the White House until May. He is described as wearing "shabby clothes and hair." He apparently made no preparation for the ceremony—a fact due as some thought to affectation—and wore a blue coat, a thick gray collar, waistcoat with a red undervest lapped over it, green velveteen breeches with pearl buttons, yarn stockings, and slippers down at the heel. He never was able to speak and delivered his address in an almost inaudible voice. His inaugural, however, is one of our great state papers.

Nellie Grant held her father's hand while he spoke.

The inauguration of James Madison (1809) was very much brighter, more ornate, than that of Jefferson's. "All the militia," says McMaster, "came over from Georgetown and Alexandria to escort the new President from his home to the Capitol." There were at least ten thousand spectators and participants at the grand inaugural ball.

Following the precedent established by Washington, and to pay his due to American

(*Concluded on page 14*)

Interview With William Allen White

Vivid American Journalist Says That the Kansas Press Is a Voice, Not a Property. Small, But Has Courage and Influence and It Pays

By DIRK P. DE YOUNG

"GO AHEAD! Shoot away!" was William Allen White's hearty response when I broached the matter of an interview with him recently on the subject of American journalism and his own achievements as a man of letters.

The editor of the Emporia *Gazette,* probably the most widely quoted newspaperman in the Middle West, does not stand on ceremony when you meet him. The welcoming smile in his blue eyes, the sandy hair on his large head, the protruding, firm-set jaw, combined with the quick movements of a short but slightly portly body, tell the world at a glance that here is a man always ready for anything—from a friendly interview to a lively combat with most any sort of antagonist. Thus when two sandy-haired sons of bleeding Kansas meet, such as White and myself, frankness is the soul of honor.

Emporia is the home of my parents. William Allen White's editorials and "Walt" Mason's daily poems which appear in all issues of the *Gazette* have been read, like the Bible, in my father's house all these years. Emporia is a town of colleges and churches where preaching and teaching go hand in hand. In that atmosphere Mr. White is thoroughly at home, lecturing at the schools on journalism, supplying the local pulpits on occasion Sundays while writing daily editorials to the 25,000 readers of his newspaper.

It was September when I visited Kansas this time, when the state is at its best. As the train moves west from Kansas City the valley of the Kaw is profuse with acres upon acres of inflorescent corn tassels. Tall elm trees, with tinted leaves of autumn, and the auburn heads of rows of Kaffir corn vie with each other in lending color to the landscape. The apples were growing red, threshing machines were humming, while large herds of Kansas kine grazed on the hillsides. And sunflowers, with brown heads as large as wagon wheels and yellow petals the size of Chinese fans, projected their tall stalks skyward in a colorful panorama. Emporia, on the Neosho River, a town of less than 15,000 persons, the home of the Kansas State Normal—the largest normal school in the United States—and of Emporia College, a large Presbyterian institution of learning, houses between two and three thousand students in its homes of culture surrounded by spreading shade trees and grassy lawns.

The morning I called at the office of the *Gazette* Mr. White was not in. He generally does his writing in the forenoon at his home, one of Emporia's comfortable residences, operating his own typewriter. His son William, going by the name of "Bill" around the town, too, received me. Calling his famous father on the telephone, he reported my presence, and the purpose of my mission. The elder White would be down at once, which took about ten minutes.

In the meantime, the son took me over the plant of the *Gazette,* a daily newspaper and commercial printing establishment in a Kansas town of less than 15,000 persons, equipped with up-to-date machinery, with a circulation for the journal which equals the circulation of dailies in the East and cities twice the size of Emporia. Besides, the actual size and quality of the publication is remarkable for a place so small. Considerable plant extension was going on while I was there, also, which indicated continued growth.

The editorial office of William Allen White is not imposing, from a furniture and fixture angle. The leather of some of the chairs gave signs of wear, as if much used by farmers, friends, and others, who drop in on the editor with the same informality today as they did thirty years ago when "Bill" White took over the struggling sheet for the sum of $3,000, paying for the same with notes, like Micawber. To some the office might actually appear plain, but to me it expressed White and it expressed Kansas journalism, which is close to the people.

Over the editor's desk, one of those high roll-top affairs with many pigeonholes in which papers of all sizes reposed, hung photographs of many noted men—Mark Twain, Theodore Roosevelt, William Jennings Bryan, Grover Cleveland, William McKinley, Warren G. Harding, Woodrow Wilson, Robert M. La Follette, and others. These and lesser ones, most of them autographed, decorated the walls of the whole office, while his letter files, I was told by his secretary, contain correspondence exchanged with the great and the near-great of the earth. Going back to the mouse-trap story of Emerson, William Allen White has brought the world to his door.

"Tell me something about Kansas journalism," I said, after a few preliminary remarks about sunflowers, the weather, and politics. "In the East, and pretty much everywhere except Kansas, the editorial page of the newspaper has lost its influence and the public no longer looks to the press as the 'Palladium of its Liberties.' I understand you still have what is known as 'independent editors' or as 'personal journalism' here, instead of capitalistic newspaper enterprises, truckling to advertisers or to other organizations, in which the editorial writers confine themselves to platitudes or noncommittal observations. What I mean, to be more specific, is the passing of such editors as Colonel Watterson, of the Louisville *Courier-Journal,* Greeley, Medill, Dana, and others, whose voices, when they spoke, expressed editorial convictions instead of the policy of a newspaper machine."

Before letting Mr. White talk, as one of the best-known editors of Kansas, I should perhaps enumerate a few of the present-day journalists of that state who are nationally known writers. There is, to start with, William Allen White himself, who has written several books, and whose articles on public questions are widely syndicated. Then we should mention Ed. Howe, of the Atchison *Globe;* Henry Allen, of the Wichita *Beacon;* Victor Murdock, of the Wichita *Eagle;* Senator Arthur Capper, of the Capper publications; former Senator Bristow of the Salina *Journal;* Clyde Reed of the Parsons *Star;* and C. M. Hayes, of the Abilene *Reflector,* a magazine writer of national reputation. Can you name offhand as many nationally known editors in any other state of the Union? Can you name a dozen, which you have heard more of, in the whole United States outside of Kansas? There may be editors more able than this Kansas group, but the public is not getting their views, as expressed in a personal way, à la White, Howe, Capper, et al. In every state that I know of, except Kansas, the tendency of journalism today, speaking generally, is to hide editorial lights under a bushel of machine-made newspapers, a condition which writers and editors as a class privately condemn. And here is what Mr. White has to say about it:

"Personal journalism," said Mr. White, "may be on the wane in other states but it is more popular in Kansas now than ever. We come about as near to having an independent press here as anywhere in the world. Our editors express their personal opinion on all important public questions as freely now as they ever did.

"There is no such thing as a 'controlled press' in Kansas, as it is known in some sections of the United States, sometimes referred to as 'kept' by capitalists. We speak our minds here on all occasions, sometimes with great individualism, calling a 'spade' a 'spade' or, if conditions warrant, we speak plainer still and call it 'a dirty shovel.' We have large capitalistic interests in Kansas, too, such as railroads, coal mines, oil, gas, and huge packing industries, but they have never succeeded in muzzling the Kansas press."

"Is the Kansas press prosperous?" I asked him. "Does this policy of independence and vigorous editorial comment hurt the revenues of the newspaper, as so many newspaper proprietors elsewhere seem to fear?"

"No other kind of journalism, except independent, personal editorial comment, such as we have here, would pay in Kansas," was Editor White's ready response. "The public has no confidence in newspapers whose editors are suspected of writing against their convictions or against the public's interests. Subsidized papers, or journals, which allow their pages to be influenced to augment advertising income, soon lose their influence. The American public is too intelligent today to be fooled on that point. A newspaper which does not support itself from the legitimate revenues of ethical newspaperdom may flourish for a time but it will eventually lose its prestige. Here in Kansas newspapers without a good editorial spine can make no headway at all.

"Newspapers in this state are on a sound financial basis generally. We have only one daily, as a rule, in cities of from 10,000 to 25,000. The net earnings of such plants average from $10,000 to $25,000 a year. In 1922, I was told, the Atchison *Globe* cleared $40,000 in a city of about 13,000 inhabitants, on a circulation of 7,000. Kansas journalism, as you see, pays dividends, too—in the coin of this realm as well as in future rewards."

So much for the independent editor of Kansas. But what about the less fearless publishers of other states who feel that the modern way of machine-made newspapers is the best—for their pocketbooks, at least. Regarding such timid souls of the craft, White has this to say:

"Publishers who dodge the issues, as they come up from day to day in the newspaper office, taking no stand at all, or a stand which is obviously that of class or of vested interests, racial, religious, or of the professional reforming type, are adopting the 'easy way.' They want to lean on some large advertiser, some influential politician, some organization with a subsidy, or something except themselves. The great editors of the past, and of the present by the way, too, have never let business interfere with their convictions.

"I do not mean by that that an editor should be a fanatic, or a radical, or everlastingly preaching. But he should be allowed to take an independent stand on vital issues, regardless of the reflection of such views in the publisher's till. In the long run an independent policy of that sort pays, too. Witness the newspapers of Kansas who live up to the old-fashioned 'canons of journalism' letting the chips fall where they may, prospering under it."

William Allen White's rise to fame as a political writer and as a national figure in letters is due to his fearlessness as well as to his ability. The road to success from the "little red schoolhouse" which reared its awful form on the hill above the town of El Dorado, Kansas, where he got the rudiments, has not always been strewn with sunflowers. A good fighter, he has engaged in many a verbal encounter. The son of a pioneer doctor and a school-teacher mother, born in 1868 in Emporia, who moved around with the boy, he acquired considerable of a spirit of adventure, tumbling around in Kansas and elsewhere before he settled down to edit the *Gazette.*

In 1884 Mr. White graduated from the town high school. He then went to the College of Emporia for a year; worked the next year as a printer's devil, and the next attended school again. Thus seesawing on, like a tumbleweed in its course, he became a reporter on the Emporia *News,* attended the State University at Lawrence where he got his Bachelor's Degree. Then, with a sheepskin securely tucked away in his jeans, he tumbled out to El Dorado again, as the manager of the *Republican* there. From the *Republican* he went to the Kansas City *Star,* as an editorial writer for three years on Colonel Nelson's great newspaper. During that time he married Miss Sallie Lindsay, like his mother, a school teacher. Getting married, with White the same as with the rest of us mortals, meant that he had to settle down, of which he said:

"I then drifted back to Emporia in 1895, buying the *Gazette* on credit, and with no capital to operate it with, except the audacity and impudence of youth. It was a small paper then and the purchase price was only $3,000, which I persuaded the former owner to part with in exchange for my notes. It was slow in developing, but it came out all right, and the note was eventually paid. Every newspaperman knows what that sort of a struggle means.

"The newspaperman, as I see it, performs a trust, the same as a lawyer, a doctor, or any other professional man. He must live up to a code which calls for printing the truth and making truthful and unbiased comment thereon. It is just as bad for a journalist to depart from that code for a consideration, as it is for the doctor or the lawyer to 'commercialize' his profession. I have always lived up to that creed in my journalistic work, and in my other writings.

"A man's conscience is his best guide. No one can do good work when he goes against that. A man has got to believe his own words to write good stuff. That's why we have Ed. Howe, Arthur Capper, Henry Allen, Victor Murdock, and a mighty host of Kansas editors, known beyond the borders of their own state. The machine-made newspapers of the country, which suppress the individuality of their editors, are killing off the Greeleys, the Medills, the Danas, the Wattersons, and the Pulitzers, of the present generation."

William Allen White is an exception to the rule that prophets are not without honor save in their own town. No country editor, anywhere, is so close to the soil as "Bill" White. He is the biggest sunflower in Emporia, with the whole town ready to sing his praises or bask in the brilliance of his literary rays.

WILLIAM ALLEN WHITE,
Reading his favorite paper, the Emporia *Gazette*.

Let Fathers and Mothers Be Heard

Should 2,316 Persons Be Able to Change the Constitution of This Country?

By IREDELL MEARES
Of the North Carolina and District of Columbia Bars

IT IS the declaration of the constitution of North Carolina that "a frequent recurrence to fundamental principles is essential to preserve the blessings of liberty."

Similar declarations will be found in the bill of rights and constitutions of the several states, in principle, if not in language, and in the Virginia Declaration of Rights, which antedated them. The recent discussion about the Constitution, amendments thereto, and the Federal courts has conduced to a better understanding and wider knowledge of the fundamental bases upon which rest our governments, both state and national, and it is to be welcomed, whatever the contrariety of opinions that may have been expressed.

Only recently the statement was made by a prominent lawyer of New York that the Constitution of the United States does not prescribe any provision for a referendum to the people on the question of any amendment to that instrument. It is true that it does not so prescribe by way of a popular vote of the mass of the American electors, voting individually and directly on the issue. It does, however, in effect, prescribe a mode of submitting a question of amendment to the people of each of the several states.

A Powerful Minority

ARTICLE V of the Constitution of the United States declares that amendments shall be valid "when ratified by three-fourths of the Legislatures of the several States, *or by conventions in three-fourths thereof,* as the one or the other mode of ratification may be proposed by the Congress." It is apparent that the Congress in submitting any amendment to the states for ratification or rejection may prescribe either one of two modes of procedure:

1. It may cause it to be submitted to the legislatures of the several states.
2. It may cause it to be submitted to a convention of the people of each of the several states.

The mode which Congress prescribes is exclusive and must be followed by the states, but there is a vast difference between the two modes as a means of registering the popular will.

The legislatures of three-fourths of the states might adopt an amendment without the people of the state having the matter discussed before them and public opinion becoming crystallized, as their members might have been elected, without regard to the issue, and prior to Congress having passed the act submitting it to the states for ratification or rejection.

It is interesting to note that all the members of all the legislatures of 48 states number 7,403, and of these 2,316 members constitute a majority in the legislatures in 36 or three-fourths of the several states, who can amend the Constitution, if an amendment be submitted to the legislatures instead of to the conventions of the people of the several states, without the proposition having been discussed before the people and their will ascertained.

It is rather startling to contemplate that 2,316 persons, members of the legislatures of the several states, can change the organic law of this nation of upward of 115,000,000 persons, without a reference of the question to them, by amendment in the manner indicated. Even if, by this mode, the proposed amendment were adopted unanimously by every legislature of all the states in this Union, the fact is that it would then be incorporated in the Constitution of the United States by the vote of only 7,403 persons, who may be members of the state legislatures at the time, and who may or may not represent the wishes of the 115,000,000 inhabitants and citizens of this country.

On the contrary, if Congress should submit any proposed amendment to a convention of the people in each of the several states, then, to such convention called specially to consider it, and either to ratify or reject it, delegates would have to be elected by the people, at an election called for the purpose, and candidates for the convention would have to take a public stand for or against ratification, discussing the issue before the people who would vote for such candidates as represented their views; thus, in effect, we would get at an expression of the people's will as to the proposed amendment—virtually and practically as the result of a referendum in each state.

Government by the People—

IT WAS through *conventions* that the states originally ratified the Constitution, as will be seen by reference to the United States statutes or Elliot's Debates; in fact, the convention of 1787, which framed the Constitution, recommended to the Congress that it be submitted for ratification or rejection to "a convention of delegates chosen in each State by the people thereof, under the recommendation of its Legislature, for their assent and ratification; and that each convention consenting and ratifying the same should give notice thereof to the United States in Congress assembled"; and the Congress, then existing under the Confederation of the States prior to the adoption of the Constitution, directed the Constitution so framed to "be transmitted to the several Legislatures in order to be submitted to a convention of the delegates chosen in each State by the people thereof, in conformity to the resolves of the convention."

Chief Justice Marshall, in the case of McCulloch vs. Maryland (4 Wheat 403) said: (The italics are ours.)

"This mode of proceeding was adopted: and by the convention, by Congress, and by the state legislatures, the instrument was submitted to the people. *They acted upon it in the only manner in which they can act safely, effectively and wisely on such a subject, by assembling in conventions.* It is true, they assembled in their several states—and where else should they have assembled? No political dreamer was ever wild enough to think of breaking down the lines which separate the states, and of compounding the American people into one common mass. Of consequence, when they act, they act in their states. But the measures they adopt do not, on that account, cease to be the measures of the people themselves."

"It is, sir," said Daniel Webster, "the people's Constitution, the people's Government; made for the people; made by the people; and answerable to the people."

If the original instrument were submitted to the people, through conventions of delegates chosen by them, *why should not important amendments take the same course?*

The reason may be found in the fact that the proponents of amendments consider it *easier to persuade a limited number of legislators* to adopt them than to induce the people, after discussion, and who are ever jealous of preserving the Constitution of the fathers, to change their organic law. It is rather singular that in these days of much talk about *popular government* Congress submitted to the legislatures, not to conventions of the *people* in each state, the Nineteenth Amendment as to woman's suffrage and the Eighteenth Amendment as to prohibition.

It was proposed in the recent Congress that the twentieth amendment, now pending for ratification, and which would give to Congress the remarkable grant of power "to limit, regulate and prohibit the labor of persons under 18 years of age," should be submitted to conventions of the people of the several states; but its proponents objected and Congress ignored the opportunity to allow the people to pass upon it through conventions, as it could have done under the article of the Constitution quoted and now submits it to the legislatures. In the debate in Congress, Mr. Montague, of Virginia, moved to amend the bill so as to submit the amendment to convention of the people in each state, whereupon Mr. Foster, of Ohio, who had introduced the measure, declared that "the distinguished gentleman of Virginia discloses the motive back of his amendment" (that is to submit it to conventions) and "every gentleman in the House, whether he is for or against this amendment, understands that the motive so evidently back of this amendment—at least, the result to be accomplished by the amendment (that is, to submit the question to conventions of the people) "would be to defeat any child labor amendment." (*Congressional Record,* Sixty-Eighth Congress, first session, p. 7254.)

Manifestly a Soviet Measure

THE advocates of this twentieth amendment were not willing that it should go to conventions of the people, because *it would involve the fathers and mothers being heard on the subject,* and the question determined by the electors. Neither did the advocates of the Eighteenth or Nineteenth amendment care to allow the people to pass on those measures. Senator Underwood, speaking in the Senate on June 4, 1919, on the Nineteenth Amendment said: "I should like to suggest to the Senator from Arizona (Mr. Ashurst) that the fathers, some 128 years ago, in writing the Constitution provided a method by which the voice of the people might be heard. .... Of course, we all know that the constitutional provision directly gives the opportunity, if Congress avails itself of it .... We challenge you to go to the hustings; we challenge you to submit this question to the people and not to the Legislatures of the States." (*Congressional Record,* June 4, 1919.)

But Senator Ashurst voiced the unwillingness of the advocates of that measure to trust to the verdict of the people in saying: "I rather, suspect—no, I cannot use that word—I dread, rather, that this may defeat, delay and hinder the celerity with which I would like to see this amendment adopted."

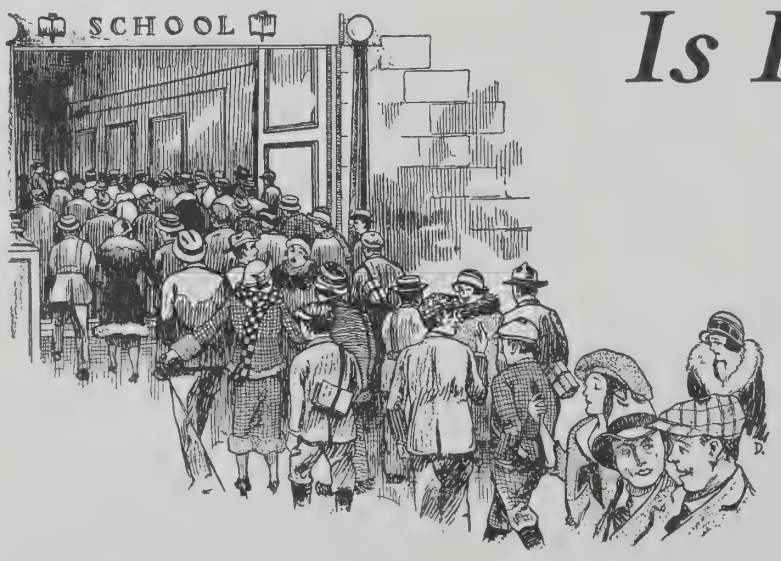
Had there been in this measure a proposition to grant a power to Congress to regulate the employment and conditions of child labor, the advocates would have been willing to submit it to conventions of the people to ratify, but because they know *it is not a child labor law* in the sense of regulating the hours, employment and ages of children, which operate upon the employer, not the child, and because it is manifestly a Soviet measure to "limit, regulate and prohibit *the labor*"—not *the employment*—"of all persons under 18 years of age," they would put it over the people, write it into the organic law of the country, through influences brought to bear on legislators, with or without the popular approval.

Like Pontius Pilate

THE fact that a Congress could be led by the influences which dictated its action to submit to the respective states this amendment is in itself an evidence that it will be influenced by the same agencies to pass laws, pursuant to the power given, create bureaus with power to make rules and regulations, having the effect of statutes, and, in effect, place the youth of this country in serfdom to the whimsical theories and guidance of bureaucratic Federal agents instead of leaving them to the love, guidance and common-sense direction of their parents.

So it is that the same influences which heckled Congress to submit this minor labor amendment to the legislatures, will, by propaganda, appeal to sentiment, threats and heckling, undertake to influence enough of the legislatures to ratify the amendment, without consultation of the people, and we may have our Constitution amended by the action of members of Congress, who, like Pontius Pilate, washed their hands of responsibility and passed it on to the legislatures, and by 2,316 members, a majority of three-fourths of the state legislatures, who may vote to adopt it.

Even in Massachusetts, where at the last election an advisory referendum was held under an act of the state legislature on the question of the ratification of the proposed twentieth amendment and the measure was defeated by a popular majority of 448,898, out of a total vote cast of 943,340, or three to one, the legislature will not be bound legally by the popular vote. It can ignore the mandate of the people and ratify the amendment, contrary to their ascertained will, although it will not likely venture so to do, and its action would be legal and the state would be counted for ratification, notwithstanding the overwhelming sentiment of the people solemnly and deliberately expressed in opposition to it. This, because Congress in submitting it to the states elected to submit it to the legislatures rather than to conventions of the several states.



Is It a Crime

AFTER more than a quarter-century of experience as an educator, I am free to say that there is something fundamentally the matter with the national drive for the child labor law.

Unfortunately there is connected with it a sentiment of mushy mollycoddlism and *a threat of national ennui.*

What we need today far more is *a national movement for teaching all the growing young to work*—not to produce money, or goods, or gain, but character.

The typical high school age of today is a generation of soft, "baby beef" physically—under-exercised, undermuscled and over-fatigued by poison toxins which percolate into the tissues of their soft, loose flesh.

They deserve a better fate at our hands.

But instead of giving the physical development, the training in common industry which their growing bodies require, we head them in the opposite direction.

We are teaching them to loaf and to regard it a national crime for anyone to ask them to work.

The ability to work with the hands and the whole body is one of the God-given prerogatives *of the young.* Experience in the great trunk-line industries, such as producing food from the soil, manufacturing as an amateur, handling and transporting goods, bartering in the common materials of business traffic—that is what every growing boy and girl in America needs today far more than they need *national laws to keep them from learning to work.*

If any reader of this article can do anything worth while, or see America as fundamentally a nation of industry and sacrifice and unselfish co-operation, then I know that that reader's early career was one of training in the performance of common work.

You cannot break a boy to work after he is sixteen and make him like it. You cannot even season and strengthen the fiber of his body so that he can endure work happily and resist fatigue, if you permit him to reach sixteen as an undeveloped idler. His spongy tissues will carry constantly an over-amount of poison

Why Women Don't Want People's Vote

Honest Confession: Legislatures Are More Easily Handled Than Citizens

Here is the story of how the fundamental law of the land has been and can again be changed, not only without the approval of the people but against their expressed disapproval.

Here is the story of feminine lobbyists who demand that the people be given no "say" on most vital decisions.

No American woman should consider herself informed without a knowledge of the facts set forth on this and the opposite page.

Members of Women's Clubs should demand of their speakers that these issues be met: for frequently even the women speakers who are sent out know nothing beyond the material contained in the one-sided propaganda literature supplied them by the political women of Washington.

IN 1912, Ohio gave a majority of 87,455 against a proposed amendment giving suffrage to women. In 1914, on the submission of the same amendment, it was defeated by a majority of 182,905. In 1917 a referendum was held on the proposition to allow women to vote in Presidential elections, and the majority against it was 146,120.

In 1919, the legislature ratified the Nineteenth Amendment (woman suffrage) but the people demanded a referendum and in two weeks the required petition was signed by 75,242 qualified voters, as provided by the state constitution. The people did not have the opportunity to pass upon the question, however, because suit was brought to restrain the state authorities from submitting the question to a referendum. The state courts refused to enjoin the state officials.

In 1915, woman suffrage was defeated as state measure in New Jersey by a majority of 51,108. On January 20, 1920, the New Jersey legislature unanimously resolved "that it was the settled policy of the Assembly that in the future all proposed constitutional changes should first be submitted to the people for their vote before the legislature acts." Then, in disregard of the resolves, on February 10, 1920, three weeks after, the same legislature ratified the Nineteenth (woman suffrage) Amendment by 34 to 24 in the senate and by 18 to 2 in the house, without any consideration of the people who had by previous vote manifested their opposition to woman suffrage.

Defying Public Opinion

THE people of Texas, at a special election held on May 24, 1919, defeated woman suffrage as a state measure by a majority of 25,029. Congress passed the act submitting the Nineteenth Amendment to the states, on June 4, 1919, whereupon, on June 29, 1919, the Texas legislature ratified it by unanimous consent in the senate and by 96 to 21 in the house, notwithstanding the people had just defeated woman suffrage at the polls.

Maine, at a special election, held in September, 1917, defeated woman suffrage as a state measure by a majority of 18,234. In January, 1918, all its representatives in Congress voted to submit the Nineteenth Amendment to the legislatures of the states and, on June 4, 1919, both of its senators, when the question was before the Senate, also voted to submit it. Its legislature, on November 5, 1919, by 22 to 5 in the senate and 72 to 68 in the house voted to ratify the amendment in defiance of the people's previously expressed opposition to woman suffrage.

In 1915, Massachusetts held an election on the inclusion of woman suffrage in the state constitution. The proposal was defeated by a majority of 133,479. Every town, city and county in the state rejected it, except two small villages; but, notwithstanding this vote of the people, the Massachusetts legislature ratified the Nineteenth (woman suffrage) Amendment.

Thus, in twenty states which had rejected it, the aggregate majority against woman suffrage was 1,346,579; while in thirteen states, which had adopted it, the aggregate majority for woman suffrage was only 244,380.

How were these things accomplished over the popular will? The New York *World* aptly said, in an editorial some time since, that "Various organizations of women, which probably do not represent 10 per cent of the sex, maintain at times a veritable reign of terror in legislative bodies by pretending to speak in the name of all women. In consequence, half the country is now bedeviled by some form or other of harem government which is in no respect a true expression of public opinion."

Mrs. Catt, president of the International Woman Suffrage Alliance and honorary president of the National Woman Suffrage Association said, at a hearing before the Woman Suffrage Committee of Congress, January 4, 1918, that, "We have now come to the time when *we no longer want a referendum,* when *we no longer will take a referendum,* and when we, therefore, come to Congress and ask for a Federal amendment."

Senator Walsh, of Massachusetts, speaking in the Senate on March 25, 1924 (*Congressional Record* p. 5073), said: "I would like to know is there any more serious indictment of a system of democratic government than the claim that *it is possible to change the organic law against the will of the people?* I repeat, is there anything more serious than that? Has it been done? In my own state it has been done. The legislature of my state voted to ratify one of those amendments which a majority of the people were, are and always have been opposed to."

Whereupon, Senator Wadsworth, of New York, said: "May I not remind the Senator that the legislature of his state ratified an amendment to the Federal Constitution, the subject matter of which had been voted upon in the State of Massachusetts and the people not only in the state at large, but in every county, every city, every town and every ward, but two in the state, rejected it?"

To which Senator Walsh replied, "The Senator is absolutely correct."

She is quoted again in the New York *Tribune,* February 16, 1917, as saying, *"It is comparatively easy to influence legislators."*

Mrs. Ida Harper, press chairman of the same association, said in the *Herald,* Republican, Salt Lake City, July 26, 1916, that *"we have no chance against the secret ballot."*

Miss Maud Younger, chairman of the Lobby Committee, National Woman's Party, in the *Suffragist,* February 7, 1917, revealed that from their "card-index system" all legislative work is directed. . . . Here is set down the record of every Congressman. Every fact that has any bearing on his personality, opinions and mental make-up is minutely detailed, ... his family, his home, his church, his clubs and his lodges. No detail is overlooked that might give a lobbyist insight into how best to approach him."

Again, in the New York *Times,* September 7, 1919, Miss Younger explained the working of their card-index system and said: "We are indexing in twenty-four states. We shall do the others as soon as the amendment is ratified. There are reasons for also wanting other state officials and mayors. You see a mayor comes in handy, because he is the official who issues permits to speakers. In this room we expect to have indexed all the important officers of government, Federal and State, from the President and the members of the Cabinet down through Congress and the States. It is very useful to have the member of the state legislature card-indexed; he often advances to higher political office. You can find out early in his career whether he is to be depended on."

Politically Sandbagged

A DISTINGUISHED United States Senator, speaking to the question of submitting the Nineteenth Amendment, said at the close of Congress: *"Three-fourths of the Senators who have come out in favor of the amendment are against it in their hearts. They have been politically sandbagged."*

It is to be hoped that the women leaders of the eighteen women's organizations, including the National League of Women Voters which actively has become the propagandist for the twentieth amendment, will not resort to the card-index system, as their source of information and inspiration to persuade members of the various legislatures to vote for ratification; nor that they will resort to the lobbying methods so graphically described in an interview by Mrs. Harriet Taylor Upton, which appeared in the Washington *Times,* August 27, 1920, and from which we quote:

"Down in Tennessee, each woman delegate representing the National Woman Suffrage Association," said Mrs. Upton, "was assigned two members of the state legislature. It was her work to keep her two men in the state by *cajoling, coddling, entertaining, amusing, and even taking them out to dinner. And we actually did all these things to keep the men in the state in order to win them over to the cause.*

"Many a fair suffraget in the wee small hours of the morning was seated across the table in a cafe or hotel, ordering dinner for the two men in her charge, and all the time adroitly winning them to the cause.

"Every hour of the night, two o'clock, three o'clock, five o'clock, some delegate would come knocking at my door at the hotel," she continued, "and say: 'Two men have left. You'll have to go out and get two more Republicans.'"

When we consider that these women organizations are engaged in the effort to have Congress given the power "to limit, regulate and prohibit the labor of persons under eighteen years of age," practically to control, standardize, and direct the development of our boys and girls, under that age, morally, physically and mentally, we have the right to expect them to approach the subject and influence active legislative supporters by means and methods that will evidence an appreciation of the grave responsibility of the issue and in a spirit which will reflect a finer womanhood than that practiced by some suffragist lobbyists as disclosed in Mrs. Upton's frank interview.

To End Feminine Lobbying

HOW will it appeal to the good women in this country, who are bearing and rearing their children in the fear of God, guarding their development into manhood and womanhood, that the proponents of this measure, which bears the earmarks of a proposal to substitute state control for parenthood of "persons under eighteen years of age," should resort to "cajoling, coddling, entertaining, amusing and taking out to dinner" the men "in order to win them over to the cause."

Is it to be repeated by lobbyists of similar type when the legislatures of the several states meet this winter?

Forewarned is forearmed and, at each capital, the men and women of this land should have an organization that, apart from favoring or opposing the amendment, will drive this kind of feminine lobbyist out of their state in scorn and contempt!

There is no time limit within which the legislatures must act. There need be no haste about their action. If not by special election, the referendum can be held at the next general election of the states. Either the members of these bodies believe in popular government or they don't. If they do, they will naturally approve the proposal to refer this amendment to the people.

to Make Boys Work?

Some Common Sense

By WILLIAM A. M'KEEVER, A. M., LL. D.

toxins. He will dread common work. He will regard it as an interference with his rights! He will look for a soft berth, for graft, for something for nothing. He will look upon schooling, as so many of our young do today, as a system that is successful only as it enables one to get by without work.

Mark you, *I am unalterably opposed to commercialized child labor; so is everybody else.* What we need is *a national child labor committee that will teach all children to work exactly enough to meet the suffering requirements of character development.* Children need to be taught to work for the sake of their health and happiness and self-reliance. They need to learn to work with their hands to experience that delightful sense of belonging to common humanity.

Not sixteen, but six, is the right age to begin to teach a child to work. We need a schedule of such training. I made one of this kind, and I hope soon to attempt a better.

A six-year-old should work about ten minutes a day.

A sixteen-year-old should work four to eight hours at common labor during the vacation of three months, and about two hours a day during the nine school months. Such an arrangement for all children alike would in a generation or two give us a new race of Americans in fiber resembling the pioneers who planted the nation.

America is destined to stand or fall in proportion as she stakes her future on the inheritances latent in the ordinary child of the common parenthood. God will continue to send us a few geniuses—a sprinkling of Lincolns, Edisons, and so on—and these will continue to be born among the lowly and work their way to the front. But it is the great body of ordinary children, reared in ordinary homes, who learn early to endure some privations, who rise from their beds fresh and alert at morning and become inured to a reasonable amount of industry.

We have more children today who are retarded industrially than are retarded intellectually. We have a generation of city sixteen-year-olds who are not more than six in their knowledge and ability to work with their hands.

I wish it were practicable to make every sixteen-year-old boy in the land a present of a cord of hardwood and a brand new ax, with the arrangement that he should cut the wood into stove lengths. I would tie wood-sawing up with his parties, his picnics, his music, his merriment, his girls, in such a manner that he would swallow the whole dose as a delightful mixture. Then, in due time, he would have in his make-up the three youthful "graces"—

Mind, Muscle and Manhood.

He guarded the door of the city temple. He looks as though somebody had stepped on his corn.

Shopping in Soochow

Hectic Scenes When Tea Was Served In the Emporium of Li Foo Yam

By MRS. L. M. CRAMER

A coolie stopping in his labors long enough to have some "chow." The average coolie's table manners leave something to be desired.

THIS morning I went shopping in the heathen city of Soochow.

Soochow is interior China, one of the old-time Chinese cities, whose wall was built during the time of Confucius, so the Chinese claim.

I rode through the street called the Kwan Chien, the street which is to Soochow what Fifth Avenue is to New York, the street of the best shops, and there I searched for that something which is old to the Oriental eye, and sacred, and new to the Occident, and, therefore, very desirable. I desired something truly Oriental, as a present for a very old friend, one whom I love dearly.

I found it, but in the possession came a surprise which is another story, as Kipling would say.

I rode through the narrow streets, my ricsha bumping along over unyielding, rough cobblestones, swiftly pulled by the bending coolie, at whose cry the slow-moving crowds parted to allow him and his "fare" to pass. Shopping is quite different in Soochow from that in New York City, San Francisco, or Podunk, Kentucky. Not even a shopping excursion into the Chinatown of New York or San Francisco gives one any idea of what that in interior China is like.

As I rode through the narrow dirty streets, had I held my hands stretched out, shoulder high, I could almost have touched the tiny shops on either side of the street. The open-front style of architecture in China leaves no opportunity for window shopping, for there are very few shops in the Chinese cities having windows in them. Across the counters of these tiny shops leaned merchants, placidly puffing away at their pipes. Their goods were not displayed as they would be in a Western city. Here one has literally to wheedle a merchant into showing his goods, for the real old Chinese merchant (and Soochow is a real old Chinese city) does not go out of his way to make a sale—he would "lose face" by even seeming to be anxious to make a sale. He prefers to give you the impression of not wanting to part with his wares, and when he does show his goods it is usually the inferior articles he shows first. The shops are dim and dull-colored, and almost without exception they are dirty. They smell musty, damp and old, and one wonders at the marvelous silks, the splendid examples of the silversmith's art, and the rare old Chinese pottery that after a time are dug from the darkest recesses of the shop, and shown to you with such a disinterested air, over counters heavy with the accumulated dust of years.

Butcher shop on the Ho Long Kai not exactly a sanitary shop with its meats hung in the open, to be fingered by any one who pleases.

But though the interior of the shops may be dull and dim, the outside, all along the street, is gay and riotous with color. In the street, above one's head, countless flags of many-colored silks flap lazily in the warm November breeze, for the sun is warm like early autumn, though it is mid-November. Long gay satin banners, heavily embroidered with Chinese characters in gold and silver thread, hung on bamboo poles stretched across the narrow street, caused me to duck my head as I rode under them. Burden-bearing coolies trotted swiftly by me, almost trampling me as I tried to alight at Wang Fu-li's silversmith shop to look at his little silver pagoda salt shakers.

Then to the street of curios, the Ho Long Kai, or Street of the Protecting Dragon. Weaving in and out through the crowd my ricsha coolie went, always calling in a loud voice that the crowd must make way for the venerable tai-tai. Around a corner into another street he sped, just missing a beggar who had crawled into the street and lay there, with gaunt arms upstretched, begging for alms.

This street with the romantic and mysterious name is what would be called a street of secondhand shops back home. In it one may find—if he knows where to look—the most ravishing old curios, once the treasure of some affluent mandarin reduced to poverty with the revolution of 1913. Here one can pick up porcelains, centuries old, at what to us of the Western world seems a mere pittance and for which one would have to pay a king's ransom if one found them in exclusive collectors' shops in New York City or San Francisco. Then one can revel in veritable billows of embroideries and mandarin coats and skirts, no longer worn in this day of the Republic of China.

In Ho Long Kai we came to the shop of Li Foo Yam where I stopped to buy some bright red paper in which to wrap my parcels. The crowd that had gathered about my ricsha when it stopped followed me into the shop, crowding it to suffocation. They wanted to know what the venerable devil was going to buy, and how much she was going to pay for it, and how much money she was going to have left. It was a ragged, dirty crowd, and when I opened my purse to get the fifteen coppers, which was the price of my purchase, everyone crowded closer about me, just curious to see, that was all.

Only the physical strength of my interpreter, I am sure, kept me from being crushed. While my purchase was being wrapped a cup of hot Chinese tea was set before me on the dirty counter. I was in a panic, for in some places to fail to drink tea set before one in a shop is an insult which a shopkeeper resents, and the customer is usually made to regret his discourtesy by the crowd which does not always restrict itself to comments nor yet to jeers.

But I didn't see how I could possibly bring myself to drink that tea. The shop was so dirty, and the cup undoubtedly had not been washed since the last time it had been used. Just then a dirty hand stretched over my shoulder, and a finger—really the dirtiest finger I ever saw—was dipped to the bottom of the cup and sucked with gusto by the ragged owner of it when he transferred it to his mouth. The man was a "rat man," and over one shoulder was hung a string of dead rats, tied by their tails to a slender rope.

Others, seeing that I did not curse out the man, nor bring upon his head the wrath of all my ancestors to the seventeenth generation, also grew bold and many dirty scabby fingers were dipped into the tea and then transferred to their mouths, to be sucked at loudly. Finally, the merchant, seeing what was happening to my tea, pushed it closer to me, and smiled an invitation to hurry up and drink what was left before that, too, was stolen from me.

The crowd outside had been augmented by new arrivals while I was busy inside the shop, among them a tiny boy—four years old perhaps—who was dressed to look like a girl in hope of fooling the evil spirits into letting him alone. The little fellow's pigtail was braided stiff with narrow crimson ribbons, and trained to stick straight up from his head—a further protection against hovering evil spirits. The clerk who had waited upon me called: "The foreign gentlemen goes" and lo and behold a path was made for me. In their scurry to get out of the way, the little boy dressed as a girl was knocked down and began to cry lustily. I gave him a couple of coppers and a few cash and his tears and yells stopped as if by magic, and he was off and away to the sweetmeat vendor a little way back, whose song and beating gong could be heard above the other noises of the city street. The last I saw of the little boy he was matching coppers with the vendor of sweets, to see if he should pay his coppers for the candy or the vendor should stand treat. They are born with the gambler's instinct in China.

The Ho Long Kai of Soochow. The poles that look like U. S. A. barber poles are simple decorations, poles wound in multicolored silks.

Right—Beggars rolling on the streets asking for alms.

The noise of a city street in the interior of China is not the street noises one hears in American cities. It is not the traffic noise, as such is known in the Western cities. In China the street noise is the song of the different vendors of food and sweets—each peddler having a different song. It is the yell of the straining ricsha and carrier coolie who seek passage through the crowds; it is the whining wail of the beggar asking alms; the chanting of passing priests; the tinkle of the bells on the little gray donkeys, who patter fleet-footed down the street; the protesting curse of the old peanut woman when a soldier fills his pockets from her scanty store, and refuses to pay; the ki-yi of a hurt wonk.

Down the Ho Long Kai I went to its very end, and there came to the shop where a wonderful pair of old blue vases are kept almost hidden behind some junk stuff. I want those vases with their wonderful color, perfect despite their age, which is more than two hundred and fifty years. I probably will never have them, but I am bargaining still, and shall continue to bargain for a time longer. In the end I may be able to strike a trade and then they will be mine. How I'd love to have them, but I'd never let the good little merchant know that, or he would not reduce his price another copper. And so, each time I go to his shop I ask for something I know he doesn't have—tapestries usually—and this gives me an opportunity to stand before those old blue treasures and drink in their beauty. So this day when I went shopping in the heathen city of Soochow I stopped in at the little shop, far cleaner than any other in the whole city, and asked for tapestries; something old and unusual, I told him.

The merchant, a youngish chap, speaks a bit of English, which is very rare in this city, and he said: "Missie, I think you go to City Temple. There ask one priest to pay you Sin-diminishing cover. He have finish catchee one good piecee."

So to the temple I went, an old, old temple erected five hundred years ago. Of course, it was not my "pidgen" to ask to see that cover as soon as I got there, "Missie you no wanchee see, bym-by see" my interpreter warned me. And so I prowled about the temple, watching an old man paint scrolls, and a priest at his devotions, followed always by a crowd which gathers instantly a foreigner appears.

When the crowd got too thick, to intimate as it were, I switched my cane about my skirts barking the shins of those who got in its way, then moving on in the space I had created. The women, when they got close to me would feel the texture of my coat, some "ahing" and others "phooing," according as they thought my garment good, or had known other tai-tais who wore much better. An old man took my eyeglasses off the bridge of my nose, and was astonished to see how much larger everything looked when seen through them. Of course, those glasses were useless to me after that until I had taken them to my own home and sterilized them.

Finally, through my interpreter, I asked to see the "Sin-diminishing cover." Immediately I had seen it I decided that it should be the present I was seeking. I wish I could make you see the beauty of that piece of tapestry. It would make a stunning wall piece in the home of my friend! It was of a very rich, dark blue satin. The design represented a tablet, beautifully carved, with the lettering in old Chinese and Tibetan characters—the entire design being woven in dull gold threads. The piece was evidently very old, and it was lovely and mellow in its age. It seemed to me then that the onlookers were awed, and that the priest was unusually loath to sell. But I managed to bargain well and finally it was mine, at what seemed a ridiculously small price considering the evident age, fine workmanship and wonderful materials of the piece. (*Concluded on page 14*)

Mr. Ford's Page

ECONOMY, like every other cry, becomes nothing but a word unless it is made vital by action. It may be worn lifeless and thin if it is used as a political slogan to serve as a substitute for other worn-out slogans. It may even become a public deception when seemingly confirmed by a tax reduction here and there, for a tax reduction may be but a sop thrown to the people out of the wasteful abundance of political finance, and may not touch the matter of economy at all.

Tax reduction is not necessarily economy; economy may at times require a temporary tax increase; but, on the whole, economy must mean lower taxes to everyone.

The enjoyment of a reduction in taxes is too likely to satisfy the public mind that the promises of economic administration are being met. Because the people know that extravagance and inefficiency register themselves in higher taxes, they feel that the lower rate of taxes must mean the opposite of extravagance and inefficiency. But this does not necessarily follow. It may mean the same amount of inefficiency and extravagance, but paid for in another way.

Economy, as a matter of fact, does not begin with taxes at all, but with management. The word comes from household management. The first economics was practiced in housekeeping, using the family's resources to the best advantage, making both ends meet, creating a surplus for new demands. Efficiency of managament went along with the financial factor, and determined it.

Economics has since become a wider term, but it still means housekeeping. Municipal administration is simply city housekeeping. National administration is simply attending the family business of the nation. The first concern is that these matters be attended properly, and when they are, the cost is less. It is an axiom of life that the more management you use, the less money it costs; and nothing is so ruinously costly as poor management.

So, economy in government is to be looked for in the *economics of government,* in the character of the managerial ability brought into action, not alone in the rise or fall of the tax rate.

The mistakes of government are precisely the mistakes of Business, with the former much intensified by the large lack of business men and business sense in the government. There are, of course, men of business ability and integrity in the government, but not enough by any means to give a business character to the whole. But few as they are they are valuable, though their value is largely negative. So much of their energy and influence is expended in stopping false moves that they have none left to initiate business moves.

The two destructive tendencies in business administration are, first, the insistent pressure of needless increase in personnel, second, the insistent pressure toward debt. Any business man will testify to these. The tendency to overload the job with men is almost as steady and "natural" as the pull of gravitation. It is not the increase in jobs—than which nothing could be better—but the increase of men per job.

This is most observable in the office end of the business. "Paper work" tends to increase at a ratio far out of proportion to the increase in business. Indeed, the "paper work" is becoming almost an industry in itself, which the main industry exists to support. Someone should some day figure out the cost of maintaining cost systems, and the rate at which "paper work" increases and encroaches on the main purpose of the business.

One of the peculiarly weak elements in government is that it is mostly "paper work." It is a vast system of clerkships, with multitudes centering at Washington and long lines stretching everywhere throughout the country. The desk would be a fitting symbol of government—the desk and paper. It is granted that a large amount of clerk assistance is necessary; it is admitted that a few of the departments, or sub-departments, are managed with a mind to efficiency in the public service, but no one acquainted with Washington ever viewed the whole scene without an almost overwhelming sense of useless numbers. No one individual gets much out of it; the opportunities to rise are few; the incentives to effort are small; the salaries paid are not at all alluring nor extravagant.

It cannot be charged that, useless and costly as a large part of this "paper army" is, it is rolling in luxury—on the contrary its status is not even average. But the point is that the country is getting little out of it either, and in the aggregate the cost of it all is great. Cutting salaries accomplishes nothing. It may well be true that firing employes accomplishes nothing. The main lack is in management which should produce service proportionate to numbers. The non-resistence to the tendency of the office to outrun all the rest is more evident at Washington than anywhere else.

MERE thrift is not the full extent to which economy in government should go. The basis of economy is economics, and the way to deal with details is to deal with them on principle. Government suffers from two of the most baneful tendencies in Business—the tendency to let "paper work" become a mountain, which labors to bring forth a tiny mouse of practical accomplishment, and the tendency to debt. Everything the Government owes is paid and yet the Government still owes it, because it has given away its control over its own wealth. Cutting off clerical expenses here and there will not suffice for the deep economic tests which should be applied to the major system itself. There is a danger that the "economy" cry, together with a little tax reduction, will serve to blind both officials and people to the real problem.

The other rock on which business breaks is that of debt. Debt is nowadays an industry. Luring people into debt is an industry. The advantages of debt have become almost a philosophy. Presumably it is true in experience, else it would not be so much insisted on, that many people, if not most, would bestir themselves very little were it not for the pressure of debt obligations. If so, they are not freemen and will not work from free motives. The debt motive is, basically, a slave motive.

When business goes into debt it owes a divided allegiance. The scavengers of finance, when they wish to put a business out of the running or secure it for themselves, always begin with the debt method. Once on that road the business has two masters to serve, the public and the speculative financier, and, like the man in Scripture, either it will scrimp the one to serve the other, though unlike the man in Scripture, it will not have the opportunity to defraud the other to serve the one. Debt leaves no choice of allegiance.

The principle is the same in Government, except that there is no reason for Government to go into debt. If government's undertakings were always economically defensible, debt would be unnecessary. The reason for government going into as much debt as it does is that there is more business sense outside the government than in it. If there had not been, government would not have given up its constitutional control over its own money, it would not have given over as a practically free concession the immensely profitable and super-powerful control of monetary functions to private parties. Government debt is largely interest, and the spectacle of a great people paying interest on what is their own will one day strike the economic mind as very droll.

For a Government to create debt in the very act of creating wealth is an anomaly which only the veiled mind of this generation prevents it from seeing.

The economics of government means more, then, than lower taxes, more than thrift, more than efficient management; it means also the founding of government activity in sound economic principles, and no one will say that our present so-called "economic practices" represent true economic principles. When anyone talks of economy in government he is handling words of tremendous import, for once the government is put on sound economic ground, half the economic hindrances to progress, and half the economic causes of poverty and misery, are removed. Of course, in a true sense, there are no "economic" causes of poverty; true economics would be the abolition and death of poverty.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

A Governor Gives His Conclusions

IT WOULD be a public service if all officials, upon their retirement, would reveal the "inside" experiences that came to them during their term of office. The custom has not arisen in America. We have all sorts of reminiscences and autobiographies, but hardly any by our chief statesmen. At the moment, one does not recall any at all immediately in the presidential category. It may be that the secrets of office are to be morally considered as the government's property, and that delicacy prevents an ex-President writing about affairs and conditions which are necessarily carried over into the administration of his successor. But the feeling is hard to suppress that a big dose of frank political confession, on the part of officials who have been able to view the whole game from the top down, would be of immense benefit to the nation. Too much writing on these matters is done from the outside.

When Governor Baxter laid down the governorship of Maine, he did an unusual thing; he made an exaugural address. As, in entering office, he gave the people a statement of his intention, on leaving office he gave the people a statement of his experiences. He plainly said that his term as Governor had not given him a high opinion of the public spirit of certain prominent business men in his state. He said that the jails had become "loafing places" because shortsighted interests were jealous of the labor that might be performed by prisoners.

But one of his shrewdest observations, and a true one, is that "the interests" are inconsistent in the matter of public ownership. They oppose public ownership in all cases except where private ownership is unprofitable, and then seek to unload on the state.

How true that is! The municipal ownership theory which swept the country a few years ago is beginning to serve corporation management in an unexpected manner. More than one city has had the spectacle of a public utility "fought" over by the city hall group and the corporation owners, and have seen the great "victory" which the city hall politicians have won in "compelling" the corporation to sell out. Usually the price is very high, and the city finds on inspecting its purchase that it has bought junk, that the real victory was with the corporation which unloaded a broken-down system at the price of a "going concern."

The bad thing about these transactions is that the public slowly learns the truth. Newspapers that were committed to public ownership simply refuse to make public the swindle. Anything a corporation is willing to sell to the public in the way of public utilities will bear the closest inspection. Usually a municipality would do the corporation a kindness if it took the utility off the corporation's hands without purchase. The price is just that much "velvet."

The Tax and Interest Burden

THE truth about taxes will come out when honest men, in charge of the finances of the government, are sufficiently goaded by public complaints to give the facts. That is beginning to occur in Michigan. Tax Commissioner Lord is telling the people of that State some wholesome truths which should have wide currency because they are nationally applicable. Fifteen years ago Michigan had practically no public debt; now it reaches the enormous sum of more than half a billion (more than five hundred million) dollars. And the annual interest charges on that debt are $26,639,256. This means that the People of the State of Michigan pay to the money lenders every month in the year more than Two Million dollars—$2,219,931, to be precise.

The motive behind most propaganda for the increase of public debt is the creation of Interest. Public debt is not so much a matter of the people borrowing money, as having money shoved at them, and urged on them by every conceivable pretext, to start interest payments toward the financial centers. The difference between common pawn-broking and public finance is that in the latter it is cities and counties and states that are pawned to the money lenders.

When we come to our staggering national debt of Thirty Billions, and our heavily oppressive *interest payment* on that debt of *One Billion Four Hundred Million a year,* it will require more than words to convince a sane citizen that serious consideration of this as a national menace is silly. We have reason to know that, behind their exterior calm and their mild insinuations as to the irresponsibility of a paper which calls attention to these matters, financiers of brains are wondering just where the nation will emerge.

One point has been gained in all this: *an agreement on the facts.* When THE DEARBORN INDEPENDENT first began to call attention to the bankruptcy of American cities and the real condition of the Public Debt, there was a disposition in political and financial circles to quibble about the facts. The pressure of the situation has abolished such child's play. The facts are now admitted.

The next point—what to do in face of the facts?—brought some interesting developments. Two of them are found in Tax Commissioner Lord's statement to the people of Michigan. First, the people are to blame. Admitted. Ignorance is the cause, but ignorance is no excuse, and certainly it does not mitigate the consequences. The people have voted for every debt-creating, interest-absorbing bond issue that has been proposed; cities and states are paying today on public works that disappeared before this generation came on the scene. Public finance is not that at all, it is misnamed; it is private finance binding the people to perpetual toll by a private system enforced by legal method. Go ahead; blame the people; it may wake them up.

Then comes step two. Mr. Lord says, practically, we must find more sources of taxation. That is always the sign of the triumph of false finance in government. That is where minds diverge. Always more, more, more! More sources of taxes! Why not, rather, fewer outlets of taxes? Granted, there are still unexplored sources of taxes; granted, there are unjust exemptions; but why always more, more? Is government the chief business of our people? Is it the Moloch which absorbs their life and produce? Has false finance such a grip upon our governments that officials cannot challenge it? Why more? What will be done with more?

These questions are thrusting themselves into general attention. Some day the people will say to their political representatives what a father says to his spendthrift son, or a builder to his contractor, "Here is a certain fixed sum to do all that requires to be done; see that you live within it." Budget fixing will be done, not inside by the spending delegation, but outside, by the paying delegation. It is rapidly coming to that in this country.

Coolidge—"Autocrat"

THE Capitol is apparently beholding a new Coolidge, whom some do not hesitate to describe as an "autocrat." Well, there is always an autocrat. If he is not the elected head, he is a concealed boss or "interest." But one thing is certain, there is autocracy somewhere. That is how things get done. The chief difficulty about autocracy is that autocrats make mistakes. Of course democracy makes mistakes, too, colossal ones, but never admits it. Democracy in a hole creates a pseudo-autocrat on whom to shoulder the blame. No one can blame a President for being President, for the responsibility is his, and he might as well have a hand in seeing that it is a good responsibility.

As to the rise of rumor over Mr. Hughes' resignation, that will be fully dealt with by development. If it is true that there were other reasons than Mr. Hughes stated, as some seem to believe, these reasons will develop in good time. If, as asserted, the President and Mr. Hughes have differing views about relationships with Russia, that too will become apparent in the development of our foreign policy under a Secretary of State who may, perhaps, be more pliable than was Mr. Hughes. At the same time there can be no doubt that in this matter Mr. Hughes represented sound American and Anglo-Saxon opinion. It would be surprising if it should develop that Mr. Coolidge holds quite different views.

Nothing New Under the Sun

THE Royal Geographical Society of England, the American Geographical Society of New York, and the Museum of the Indian Heye Foundation have combined in the dispatch of an expedition to explore a hidden ancient city in the heart of Brazil. Colonel P. H. Fawcett is the leader of the expedition, and believes that in this region there existed an advanced civilization of an unknown white race, perhaps 10,000 years old, antedating that of Egypt. He believes that these people had a good working knowledge of sciences that we are pleased to call "modern," including the secret of a mysterious kind of light possibly derived from knowledge of basic atomic forces.

The discoveries which have already been made in Mexico and in various parts of the United States of vast ruins prove that there at one time existed on this continent a people whose knowledge of architecture, engineering, astronomy and the fine arts, equaled, if not surpassed, that of the best periods of Egypt or Assyria, the part of the world which is generally regarded as the cradle of the human race.

One of the assumptions of the modern mind is that the world has steadily advanced in wisdom and understanding and in knowledge of all descriptions, from the beginning to the present day. This may be true of some peoples, but it is not true of the world as a whole. Some races lost the civilization they won. The reason seems to have been that moral culture did not keep pace with intellectual. It therefore seems probable that many of the so-called discoveries of the present day are not discoveries at all, but *re-discoveries.*

An Oddity

IT IS an oddity of the national constitution, which its framers insisted should be submitted to *conventions* of the several states for adoption or rejection, that it should contain a clause permitting it to be amended by the legislatures without reference to the people, either by direct vote or through conventions, and it is singular that *Congress has uniformly preferred and followed the mode of submitting amendments to the legislatures.*

In view of the radical changes which have been incorporated in the national Constitution and even the more radical and revolutionary change proposed in the so-called child labor amendment, *it is time popular sentiment should demand amendments be submitted to conventions of the state or that the Constitution itself be amended so as to require that they be submitted to a referendum of the people* in each state, as proposed by a bill pending in Congress and known as the Wadsworth-Garrett back-to-the-people proposed amendment.

The proposed twentieth amendment, which has been submitted to the states, and is now awaiting their action, cannot be submitted to conventions because Congress has elected to submit it to the legislatures of the states. The legislature in any state, however, can call for an advisory referendum, as did Massachusetts, and, after ascertaining the popular will, be guided by its mandate.

The New Cabinet Members

IN FORMING first impressions of President Coolidge's new cabinet appointments it is perhaps advisable to take into account what might be called the Cabinet Disappointments, the men who were urged for appointment and refused. The sole regret rising out of the appointment of Attorney-General Stone to the Supreme Court is that it cuts short, for the time at least, a very promising administration of the Attorney-Generalship. Mr. Warren, who succeeds Mr. Stone, does not at first blush promise so much in his aspect as a lawyer, but he has solid achievements behind him in private and public life, and for the present he seems to be of that class whose absence of flying colors upon entering office may be atoned for by the superior fortune of winning his colors and popular approval by service. The same may be said of Mr. Kellogg. There is no disposition anywhere to judge these gentlemen disapprovingly in advance, but it is distinctly felt that their reputation, if any, is ahead of them. Those who wish their country well must wish for the success of all her servants.

One thing is certain: President Coolidge could have appointed less qualified men; indeed men of lesser promise were strongly urged upon him. So that, for the present, this must be the substance of public opinion, "Whether the President could have done better is a question; it is not a question that he could easily have done, and was urged to do, worse." He certainly did not play into the hands of any coalition of politicians who swarmed to dictate or influence the appointments.

You Remember the Medicine Show?

When Graveyards Yawned, Ghosts Walked, and Gold Chains Glittered

By F. J. CLIFFORD

IT WAS generally supposed, at least by the people of this "neck o' the woods," that the medicine show, that old-time creation so closely associated with our childhood days, was completely extinct—gone the way of the old square dance, the husking and quilting bees, the "barn-raisin's" and other interestingly helpful amusements of our early national life.

I speak of the medicine show being closely associated with our youthful days, as all children seem to gravitate to it just as naturally as steel filings to a magnet.

Even the "doctor's" long and tedious harangue over the health-giving properties of his wonderful remedies is endured as with sleep-heavy eyes and nodding heads the smaller children struggle to keep awake so as not to miss the thrilling ghost-scene that is promised to close the program. Anybody knows who has ever attended one, that a medicine show is no show at all without at least one ghost-scene in its list of nightly attractions. It may be that the word FREE, in large letters over the entrance, is the source of much of its drawing power, even for persons of mature years.

When the medicine show suddenly appeared in town from nowhere in particular, that one word FREE was displayed in the most prominent position. It was then that the mothers were bombarded with: "Maw—O maw—'kin I go to the medicine show—it's FREE."

And then, when we went to it—long before the scheduled opening time, "so's not to miss none of it"—we sat goggle-eyed, staring at the curtain, back of which our fertile imaginations pictured a thousand wonderful things, and uttering ejaculations such as "I bet'cha this" and "I bet'cha that."

Of course, there was the black-face comedian that drummed out music and performed all kinds of acrobatic feats on and around a very much used old banjo. The "doctor" cracked a few jokes and told a story or two before introducing his goods.

The first thing was a shaving soap, a most wonderful preparation, the way the "doctor" described it.

"It is guaranteed to grow hair on the lip of any lovelorn youth," he shouted. (Mustaches were in style then.) "It will make the wiriest beard so soft you can shave with a butter-knife, and make the skin as smooth as a baby's. If you get some in your mouth, you can eat it." And he proved his assertion by consuming handfuls from a huge foamy mass he had beaten up in a big bowl. The "Negro" balanced a great chunk of it in his two hands as he ate holes into it; the gobs of it sticking to his black face, bringing peals of laughter from the audience.

"It's good for the vision," the "doctor" shouted above the tumult, as he rubbed handfuls into his eyes. "It's a cream, contains no alkali or acids. It makes old eyes like new. Throw away your glasses and buy this wonderful preparation, no matter if it's the last ten cents you have. In the years to come you will thank me for selling it."

And the people bought it right and left. When the sales lagged, he spurred them on with the announcement:

"All those who have even numbers on your packages, raise your hand and I will make you a present of this massive gold watch-chain," and he held a glittering chain up to view.

It was massive all right—one of those log-chain affairs that stretch across the vest from pocket to pocket. To make it more effective, he spread it across his own ample bosom.

Men fought their way forward to get one of the baubles. In memory I can see my Uncle Rufus, a tight-fisted old Scotsman, his great frame allowing him to lean far over the heads of the rest as, with outstretched hand, he clutched for the shining chain, his lower jaw rising and falling in nervous eagerness.

Then followed the "doctor's" wonderful health-giving "Kickapoo Indian remedies." "Guaranteed to break up a cold, kill a bealing in the ear, cure the fever, heal cuts, bruises, and sprains; rejuvenate the stomach, and bring back the vigor of youthful days."

He sold the stuff—scads of it. When the buying lagged, he displayed his gold chains and finger rings. That would always bring up a few more customers. He kept this up until his practiced eye told him that all the available harvest had been reaped.

Then came the closing scene; that which we had waited for so patiently. More than one youngster who had been overpowered by sleep was roused up and his bewildered gaze directed to the rude stage as he was told to: "Look-it! Look-it! Y'er going to see the ghost in about a min'it."

And there the darky sat on a bench close by a crudely constructed gravestone, telling how he was hired to sleep one night in the old graveyard, and that he wasn't afraid of no old ghosts—"No suh." Then out of the deep shadows back of the stage came a white-draped thing, gliding silently along. Right behind the gravestone the thing reached out and plucked at the darky's sleeve, causing that worthy to gasp and look about in amazement. And then, when the "ghost" laid a pale, grisly hand on the Negro's head and he sank in terror on the floor, we were so thrilled that we could not utter a sound; could not even swallow, but just sit and look and look and look.

But the black man had a song that was supposed to drive the ghosts away. So he started singing in a very quavery voice:

"O—de old jaw-bone—O—de old jaw-bone."

But the song had no deterrent influence on the "ghost"; in fact it had the opposite effect, for the fearsome figure slipped around and sat down beside the singer.

Nearly bursting with excitement, we waited till the darky would see his awful companion. But the singer kept on until at last he announced that he had driven all the ghosts and things from the place. He looked boastfully around until his eyes took in the object sitting beside him.

The closing scene, "Y're going to see a ghost in about a min'it!"

That agonized look on the darky's face! I can see it yet. His eyes seemed to pop out of his head. The ghost slid toward him, the darky promptly slid away; then as the "ghost" came closer, the Negro slid away to the very end of the bench. Then when the "ghost" reached out and started to lay a hand on him, the black man lifting his arms and leaning far back pleaded in trembling accents:

"D-d-doan' you-all touch me—M-m-m-is-ta ghost-man. A-a-hain't dun nuthing—deed Ah ain't."

But the "ghost" kept on coming so that finally the darky, uttering a wild yell, broke and ran for the side curtain with the "ghost" in pursuit. As they disappeared from view our straining ears caught the thud, thud, thud of the black man's feet and the pad, pad, pad of the ghost's, getting fainter and fainter, until a deathlike stillness filled the old schoolroom.

Right out of the deep shadows came a white-draped thing.

Saucer-eyed and with crinkling scalps we sat and waited. Creepy waves surged up and down our spines and made us shiver in the close, warm air. Here and there a half-smothered whimper announced that the scene was a little too real for some of the younger ones who hid their frightened faces behind the backs of their older companions.

Presently—from the opposite side of the stage and apparently away off in the distance—our keen ears caught the thud, thud, thud, and the pad, pad, pad, of the racers' feet, ever so faintly at first, then gradually growing louder and louder till the fleeing darky and the grimly pursuing "ghost" burst across the stage.

I don't know just how it ended; whether the "ghost" got his frightened victim or not, but one thing is certain: It was the most wonderful show I had ever seen.

I had supposed that the medicine show was extinct; but one drifted in a short time ago. Like the old-time apparition it seemed to come right out of nowhere in particular. But I don't believe there was the excitement among the children that there used to be in the old days.

The show stayed a week and it was surprising to see how closely it followed the general program of its predecessors. Only there was this difference: the acting was better and the presents that were given away—not to the men but to the ladies—were of better quality.

I asked the "doctor" the reason of this. He answered:

"Women are better advertisers than men."

"Why is that?" I asked.

"I don't know," he replied, "unless it's because they talk more."

The "doctor" told of many interesting things connected with the medicine-show "game." When I commented on his roofless tent being particularly adapted to the Far West, where rains seldom occur in the summer months, he replied:

"Medicine shows almost always use the "airodrome" style of tent (roofless) in the East as well as the West. People are always afraid of the tent with a roof on it. Afraid that it will blow down on them if there is the least wind blowing. And when they are afraid of things they don't buy. It distracts their attention from what I am saying.

"In the conducting of a medicine show," the "doctor" went on, "we must have the undivided attention of our audience. In other words, we must make them think about what we are telling them, for the individual who is thinking of something else is not going to buy anything of us."

On the opening night, a good-sized audience greeted the "doctor's" assistants. One of them, a black-face comedian, started the show with some good singing and character acting. He was followed by an oldish man with trick violin playing. A song or two was given by a lady, accompanied by a man at the piano. Then at the opportune time, the "doctor" himself appeared, a curly-haired, dignified sort of a man; big and portly. He ponderously stepped to the front of the stage and, after surveying his audience for a moment in contemplative silence, started the show.

His first act was to arouse the sporting spirit of his audience by sending his agents among them, selling prize candy packages. An old bachelor found a pair of ladies silk hose in his package, much to his evident embarrassment. A little child got a book of jokes, a lady received a very shiny manicure set, others got a napkin ring, a cigaret holder, scissors, goggles, knife and chain, whistles, and so on.

The sharp-eyed agents watched for the prizes. The glittering manicure set and silk stockings were held up to to the admiring gaze of the audience, and this was generally followed by some brisk buying by the winners' nearest neighbors. The desire to gamble caused more than one old tight-fist to slip the fifteen cents that the package cost into the hands of some youngster, with the guiltily whispered instruction to "Get one of them packages."

Some of the prizes brought facetious remarks from the agent. Holding aloft a glittering chain, he would remark:

"Solid brass—guaranteed not to turn to gold."

Or of a shiny napkin ring, he would say:

"Quarantined for twenty years."

The jokes were not haphazard or without design. They were meant to instill a devil-may-care spirit into the audience.

When enough of this had been administered the "doctor" started his part of the program by solemnly extolling the manifold virtues of his wonderful preparation: "Made up only of time-tested plants. Plants that the wild life of the woods go to when they are sick. Plants that the human animal craves when he is diseased of body."

Before offering his medicine for sale, he promised three prizes that would be given out THE NEXT NIGHT to those who held the lucky numbers in the packages of medicine he would offer them. None of the prizes would be less than a dollar and a half and might be worth twenty-five dollars. The selling started with lively clamor, the pianist pounding the keys and the agents jumping and shouting when a sale was made. When the buying lagged, the "doctor" jerked everything to a standstill.

"See here," he said quietly, "I'm not going to coax you people to take this medicine. I want you to buy it for its health-giving properties only. If you're poor and down to your last dollar, spend it for this wonderful health restorative and regain your old-time pep and earn more dollars. Now, all together, let's go."

His little talks always brought on a wave of buying. It reminded me so much of a persistent fisherman who, by constantly varying his bait and patiently staying with it, managed to take home a good-sized string of fish.

The medicine show has departed for parts unknown. And with it has gone some of the money of some of the people and all the ready money of a few.

U. S. Women Elbow Out Paris Modes

Paris No Longer the Mecca for Devotees of Distinction in Female Attire

By JEAN MOWAT

"PARIS fashions?" repeated the American costume designer, in response to my query. "Certainly, we have Paris fashions. But we have other fashions these days, too. It is not all a one-way traffic any more. We get ideas from Paris, but we also get ideas from the Pacific Coast, yes, from both shores of the Pacific Coast, for that matter. Did you ever stop to think what a tremendous part geography plays in American fashions?"

"But Paris," I started to protest faintly.

"Oh, we won't compete with the Old World for some time," he conceded, "but when I look back over the past quarter-century it is amazing the strides we have made, especially considering the importance of geography.

"Here, in New York, we look to Europe, but Chicago, St. Louis, Kansas City, Minneapolis, and other cities of the Mississippi Valley and the prairie states feel a local influence. While on the Pacific Coast, cut off by mountain ranges, influenced by peculiar climatic conditions and the Oriental flavor of each city's Chinatown, still another local tendency in apparel is evident. Each of these sections shows a distinct flavor of its own. And yet, as far as the fashion world is concerned all of these women wear just about the same silhouette.

"It always interests me to observe how closely Paris and the local makers of costumes come out with ideas almost identical. It's really remarkable when you stop to think."

"How do you account for it?" I asked.

"Oh, we recognize thought waves in designing just as in anything else that is creative, as music, literature, or art. How a designer finds an idea can no more be explained than how a story came into being in your mind. We, in America, received great stimulation and inspiration from the war, because we were confronted with the necessity of providing our own new models. Just what the war did for American fashions is not fully appreciated even by the creators of fashion, while to the general public the idea of relating war with the undoubted growth of costume design in America most certainly never occurs," concluded the designer.

American Designers Learn to Fly

FOR generations Paris has, of course, been the style source for all women's apparel, but today—in America—what is worn on Fifth Avenue has about as much weight as what is worn on the Rue de la Paix. When one goes to the opera in Paris and sees a well-groomed woman, the chances are about 100 to 1 that she is an American wearing clothes made in America. Therefore, it is not surprising that Paris is curious about the American's new clothes.

And why shouldn't Fifth Avenue reflect the smartest modes of the world? When a person from beyond the Alleghenies goes to New York he takes his smartest apparel—and evening clothes—and not only has a good time but undoubtedly one of the clever designers or fashion artists finds a note in his costume that can be used to advantage in a new frock or coat bearing the name of a maker of fine clothes in New York City. So you, who come from the vast prairies, the mountain states or the Pacific Coast all have a share in making Fifth Avenue world renowned in fashiondom.

Consequently, Paris is often uncomfortable, for the selling ratio of American garments to foreign is placed at 4 to 1 by a manufacturer who is a keen business producer and has won unusual success in this industry. "This is a question we have never been able to answer," he told me. "Our designers go abroad, although they also go to Hot Springs, French Lick, and Lakewood, but it often seems that the foreign trips are less productive than those made to our own resorts.

"I have suggested to Parisian model makers that they come over and study our climates and country, but in their opinion the matter of climate has little to do with fashions. Yet they have designed and sent us heavy metal and velvet robes for summer dancing gowns, and we have nights when even a chiffon or lace feels much too warm. Paris must secure the American viewpoint if she is to hold her place as leader in the fashion world. This year, for the first time," concluded this man, "French designers have made models suitable for the American woman at home."

For years America had been struggling along with her own ideas which a few daring fashion designers continued to present year after year—then came the World War and for the first time America was without foreign inspiration and models to copy. Did she stop selling clothes? Not she. Never before had such an apparel business been written in the history of modern merchandising, and during the war American designers tried their wings and found they could fly. The war was expensive to the merchant and to the consumer. Prices rose to such an extent that women bought fewer gowns, simpler gowns, but they, therefore, insisted that these few should be well designed and well made.

The Rise of Palm Beach

THE foreign garment no longer obtainable, the American designer was given his real opportunity and that he was ready for it and capable of taking such control of the situation as the gods of war had made for him was amply demonstrated in the fact that from that period dates the emancipation of the American woman from foreign fashions. And today she asserts that freedom in a thousand details of her costume and in a variety of silhouettes in her wardrobe.

It was the war that gave to America an opportunity to develop that great fashion show place, Palm Beach. In the spas and other resorts of European fashionable society are seen the manikins, or dressmakers' models, who are sent there to wear the latest creations from the workrooms of their employers. But in Palm Beach few professional costume exploiters are seen. The costumes of society itself set the styles. Those of the leisure class who enjoy a holiday in this favored winter playground, by their acceptance or rejection of apparel worn here, set the stamp of approval or the seal of oblivion, show the trend of fashion in the land farther north during the early summer.

Paris has found, to her consternation, that since the war the American woman refuses to be put into a clothes-groove by any designer, manufacturer, or merchant and, in speaking of the present-day period of fashion freedom, a leading buyer of one of the world's greatest stores, just back from Paris, said to me: "She—the American woman—is so independent that no matter what any style center decrees she takes it or leaves it; never for a moment does she forget that she is an individual and she demands clothes that express her individuality.

"Sometimes a modification of an existing style will find acceptance; again she may reject as entirely unsuitable some new European vogue. She will accept no one's dictation."

Of course, America, like Europe, is influenced by certain combinations of circumstances that force a definite style to the front. The recent vogue of high-colored shoes, of brilliant shades and loud, blazing printed fabrics was a result of interest aroused by news stories that gave the general public an interest in matters Egyptian. The rediscovery of ancient Egypt was not merely an indication of the long past-due eruption of color. For three years Paris had tried to popularize Egyptian motifs—but the American would have none of them. This attempt had been general yet was a failure until the opening of the tomb of King Tutankhamen brought Egypt before the reading public. Then the goods that had lain uncalled for were brought out and within a few days the dry-goods merchants all over the country were in position to display King Tut materials. It was, apparently, an overnight fashion.

Yet, truth to tell, there was many a conference of which the following is typical:

Merchandise Manager to Buyer: "Have you sold the prints in those frightfully high colors that you bought some time ago?"

Buyer to Merchandise Manager: "We have a few pieces, but they are not saleable. We've taken three losses on them."

Merchandise Manager: "All right. We'll sell them now. Get them out." Picking up the telephone he asked for the sign-writing department. "Hello, Jack, we are going to have a sale on some Egyptian novelties. I want a poster-card for this, and some price cards for the sale. See me late this afternoon and I'll give you the prices."

And when the great sale of Egyptian pattern materials took place, the public flocked to purchase the novelty and the merchant wrote a profit where losses had stood before. Heartened by these events, the jobbers unloaded all the materials they had not been able to move and the mills having certain cloths which had not sold, at once slapped onto the rollers plenty of color and all sorts of queer motifs which were labeled Egyptian. It was months later before the real motifs of Egyptian designs of the pre-Christian Era were featured in exquisite designs and colorings for evening wear. But, sad to relate, by that time the word "Egyptian" was taboo. So much inartistic material had been marketed under this name, such quantities of cheap and vulgar-looking garments had been ticketed "Egyptian," that persons of discrimination had turned against the term. And so, oddly enough, when the *real* Egyptian designs reached the market they had to sell under an alias to sell at all.

When a Woman Demands Style

WE do not sink into hopeless middle age in this country. The older a woman grows the better groomed she is and she demands clothing that makes her attractive for her age and not a copy of styles suitable for youth but for her a bit ridiculous. But this Paris did not understand, so when American women demanded apparel that was large enough for them—sizes 42 to 53—Paris was too busy to listen, as she was designing robes for the debutantes and merely shrugged her classic shoulders at the mention of *such* sizes in clothes. But the cry of protest from these women, who could find nothing in the department stores to fit them, finally reached the ears of the manufacturers—via the buyers of the stores—and, with an ear to the ground, a few farsighted men seized the opportunity, offering these sizes in new and practical styles. These men had seen a ray of light and after that there was nothing left for any one who might have been a competitor but "to watch their smoke."

Studying the situation it was found many women required larger sizes; some estimates place this at 50 per cent for the United States. Occasionally these women had their clothes made by a dressmaker, more often at home. Style? There was none. So a new idea was worked out in these stout clothes for the larger women and sent to the stores for distribution. "We make these for people in the West," a New York manufacturer told me some years ago, "and it's fine business." Since that time he has amended his statement and has found that the East offers him just as much opportunity to place his garments as the West ever did.

What this new departure has meant to this class of women is beyond words. They were told they could not wear colors, nor blouses, nor a hundred and one other fancies dear to the feminine heart. Artistically it was said these were wrong and would only make a woman appear larger. But about this time large women entered the designing and buying field and quickly put such notions into the discard.

"Give a woman additional material in her costume, make it fit her, in a pattern just as rich and colorful as her daughter wears, give her sweaters, and high-colored bathing suits with plenty of room, and she won't look larger than she would if dressed in black," was the emphatic statement made by a leading designer to me. "I weigh 185 and do I look as if I was all worn out and ready to be done in black and gray? Colors were meant to be worn, and we big women are going to wear them just as well as the perfect thirty-sixes, it is all a matter of lines, and if the right ones are chosen one is just as slender in color as in any drab shade."

While this development of the stout-wear industry in New York was progressing and gaining ground that at first seemed impossible, there was an evolution of an entirely different character beginning to make itself felt out on the Pacific Coast. Stories of new styles began to creep into the columns of trade journals; buyers from Coast stores wanted something different.

The Fall of Humpty Dumpty

SOON attention was diverted to Los Angeles and the style earthquake that originated there has been rocking the fashion world for a number of seasons. Los Angeles is the Home of the Sports Clothes; the Home of the Surf Bathing Suit; the Home of the Bungalow Dress. These came about naturally; the climate and the mode of life induced them. No woman wanted to be "all dolled up" and outdoors all the time.

The Pacific Coast divided from Paris by a continent and an ocean did not voice its disapprobation definitely of the fashions its buyers brought back, yet it failed to buy, regarding the colorings as gloomy, out of consonance with the surroundings of the outdoor, sunshiny life.

Humpty Dumpty suffered no greater shock than did some well-known manufacturing establishments when the Coast buyers insisted upon color, more color and *more* color. "Some one's crazy," was the manufacturer's comment. It seemed so, anyway. While these eastern houses puttered about trying to reconcile their ideas with the western buyers' demands, manufacturers on the Pacific Coast started to put these ideas into work and sports apparel was born of a demand distinctly American in inspiration and development.

Previous to this time elaborate velvet and ribbon corsages had been worn in an effort to brighten dull-toned costumes, but these were not appropriate for the new sports outfits. A new flower corsage was needed, something just as effective as the new clothes. An accident solved the problem. A buyer of one of the leading stores, on opening some new stock, found a box of organdie flowers among the goods. The novelty created some comment and New York, alert for new sales openings, began shipping organdie for flower-making, but nobody seemed to care for the novelty. Then some merchant, cleverer than the rest, saw the possibilities of using this idea with sports costumes as more appropriate than the silk and velvet corsages.

Modes on the Pacific Coast

WITHIN six months not an organdie corsage was to be found in the shops, new shipments were sold almost before they were opened. Chicago followed the vogue and soon New York fell into line and gave the new corsage her stamp of approval. And back of the vogue is the story of a tiny home-factory in an Illinois town that had misplaced the original box of organdie flowers from a sample lot, accidentally shipped it to the Coast and did not suspect, until reorders began to arrive, what had become of the missing box.

Those "in the know" travel to California regularly—not for a vacation, not for their health, not for scenery, not for climate, not for fine fruits, but for advance information as to what may be expected next in the American Fashion World. For not only has climate done its part in Los Angeles to make sports clothes the correct apparel for outdoors, but it is the home of motion pictures.

Recently a customer who was in an exclusive shop said to the owner: "Please go and see the movie at the Rose Palace this week. The heroine wears a black hat with a white costume at the horse race. I want a costume like that." The proprietor went to the theater, saw the heroine's clothes and reproduced them, to the great satisfaction of the customer.

Without any publicity, not even an announcement in the personal column of trade journals, designers for important eastern houses make regular trips to the Pacific Coast. Their itinerary includes San Francisco (for tailored modes), Los Angeles for general style, Hollywood, Portland, Seattle and Vancouver, with stops—during the season—at the important Rocky Mountain resorts (Glacier, Lake Louise, Banff), as well as Denver, Chicago, Cleveland, and possibly Detroit. These designers travel incognito, as it were, and are to all appearances on a holiday trip.

The conclusion of this article will appear next week.

Winter Paradise in the Adirondacks

Placid Valley Where John Brown Lived and Stevenson Was Inspired

Ski-jumping contest at Lake Placid Club Ski-Jump.

By E. L. M'COLGIN

THE Adirondack Mountains of New York State have historical associations quite as interesting as their scenic and climatic features.

John Brown, of Ossawatomie, lived on a farm in the valley south of Lake Placid. He set out from there upon the adventure that flamed forth at Harpers Ferry and terminated in Brown's execution at Charlestown, Virginia.

Brown was buried at his Placid valley residence, which is at the summit of a bluff two hundred feet above the west branch of the Ausable River. The State of New York is the custodian of the property.

Dr. Edward L. Trudeau demonstrated the efficacy of the fresh-air treatment of tuberculosis at Saranac. Robert Louis Stevenson sought relief through Trudeau and spent a winter in Saranac where he busied himself with writing and largely disregarding his physician's régime. In describing the conception of "The Master of Ballantrae," Stevenson wrote:

"I was walking one night on the veranda of a small house in which I lived outside the hamlet of Saranac. It was winter; the night was very dark; the air extraordinarily clear and cold and sweet with the purity of forests. For the making of a tale here were fine conditions. On such a fine frosty night with no wind and the thermometer below zero, the brain works with great vivacity. 'Come,' said I to my engine, 'let us make a tale.'"

The Baker cottage at Saranac, where Stevenson lived and wrote, is now maintained as a museum and memorial to the author of "Treasure Island."

Paul Smith, the St. Regis tavern keeper who became internationally famous as the host of men of affairs, was the modern Nestor of the Adirondacks. He was the patron of Trudeau and an advisor of Melvil Dewey, the founder of the Lake Placid Club. Many famous Adirondack estates were formerly part of Paul Smith's holdings. He made the Adirondacks popular and became a millionaire.

Land grants or so-called "purchases," the size of German and Italian principalities, formerly intrigued the imaginations of many who vainly sought to found industrial enterprises. Paul Smith proved the real wealth-getting potentialities of the Adirondacks were in their climate and scenery.

Joseph Bonaparte, the ex-king of Spain and Naples and brother of Napoleon, purchased a tract of more than one hundred thousand acres. Lake Bonaparte on which his hunting lodge stood recalls his summer visits there when he drove in a coach-and-six from his home at Bordentown, New Jersey.

The Empire State has, in its Adirondack Park, as the public lands there are termed, made available to the public the largest area of its sort in the United States.

The Yellowstone Park is smaller by two thousand square miles and the State of Connecticut does not equal in size the magnificent expanse of peaks, forests and waters embraced in America's most accessible natural park.

The constitution of New York State contains this wise provision, which might be copied by other commonwealths:

"The lands of the State now owned or hereafter to be acquired constituting the forest preserves as fixed by law shall be forever kept as wild forest lands. They shall not be leased, sold or exchanged or be taken by any corporation public or private nor shall the timber thereon be sold, removed or destroyed."

The Adirondack Mountains are an offshoot of the Laurentian plateau which covers two million square miles of the region surrounding Hudson's Bay. It is made up of the most ancient granite of the world's foundation. The southern limit of the Laurentians sweeps west from Quebec city to about fifty miles above Ottawa and then bends abruptly south through Ontario, crossing the international line between Brockville and Kingston and rising abruptly as the Adirondacks.

The mountains of ancient Laurentia were bold high ranges, but the glaciers of the ice age planed them down until we have the present moderate heights of the Adirondacks as their remains.

There are about two thousand peaks in the Adirondacks and the highest mountains inclose the Lake Placid district, which includes the twin lakes, Placid and Mirror, the great club, the village and the valley, which is a superb plateau resembling the so-called parks of the western mountains.

The human race finds in the Placid valley the climatic elements requisite for ideal living conditions. Authorities say that an altitude of 1,800 feet is necessary for stimulation and tonic and that above 2,000 feet too many hearts are affected. There is a wide range of weather at Placid. Without such variation any climate soon loses its savor. The prevailing southwest winds have swept over a three-hundred-mile reach of balsam-clad hills before ventilating this favored region. Thus they are fresh and sweet, devoid of a vestige of city smoke and dirt.

The two highways from the east enter the valley through the Wilmington Notch gorge and the spectacular Cascades, the automobilists' high spots. The Saranac road to the north and west is paralleled by the joint Placid spur of the New York Central and the Delaware & Hudson railroads.

Mt. Whiteface, 4,871 feet, the most frequently climbed high peak, and his companions, with Placid and Mirror lakes at their feet, at the northern end of the valley, suggest the Italian lake scenes. There is nothing so fine in the Adirondacks.

The southern rampart of the valley is made up of the range of the highest peaks in the park. It is pierced by but two difficult foot trails, the Avalanche and Indian passes, the most savage portals in all the eastern mountains.

Mt. Marcy, 5,344 feet, frequently referred to by the more significant Indian name, Tahawus, the cloud piercer, is the highest point in the state. The dark Panther gorge lies between Mt. Haystack, 4,918 feet, and Mt. Marcy. Lake Tear of the Clouds, 4,327 feet high, lying on Marcy's southwestern slope between that peak and Mt. Skylight, 4,889 feet, is the source of the Hudson River.

Many declare that the view from Mt. McIntyre, 5,201 feet, the second highest mountain, is better than that from Marcy. One who climbs any of these higher peaks, especially on one of those glorious days after a rain has cleared away, is well rewarded. The Adirondack Park, Lake Champlain, and the Green Mountains of Vermont, the St. Lawrence and sometimes a glimpse of Montreal are spread before him. The famous Indian Pass, 3,870 feet, the home of the stone giants, threads its way between McIntyre and the vertical cliffs of Wallface Mountain. On the opposite side of McIntyre, Avalanche Pass separates it from Mt. Colden, 4,753 feet.

Lake Clear, a little heart-shaped body of water, which presents a charming picture, especially when viewed from the top of McIntyre or Marcy, lies at the northern base of McIntyre, the site of the old Adirondack Inn, destroyed by the forest fire of 1903. Mountain climbers have the free use of several lean-tos on the shore of the lake, where the northern trails to the range and the passes converge. The Gothics, 4,744 feet, and a jumble of other mountains are also included in the range.

Mt. Ampersand, 3,432 feet, is the principal summit to the west of Placid. The scene from its top, which includes the Saranac, Regis and Raquette waters, has been described by Dr. Henry Van Dyke.

Follensby pond or lake at the foot of Ampersand was the location of the Philosophers' Camp of the Adirondack Club in 1858. The ten Boston men who made up the first party included such giants as Ralph Waldo Emerson, James Russell Lowell and Louis Agassiz. Longfellow declined to accept when he found Emerson was going! Emerson has left a delightful record of it:

"We seemed the dwellers of the zodiac,
So pure the Alpine element we breathed,
So light so lofty pictures came and went."

Melvil Dewey is the founder and president of the Lake Placid Club as well as the founder of the American Library Association, the exponent of simplified spelling, and an executive officer of the New York State educational establishment.

Dewey brought Swiss and Scandinavian winter-sports experts to Lake Placid and soon the whole country became converted to the pastimes of the white season. Now the club is as crowded in the midwinter period as it is in August.

The visitor to Lake Placid who is charmed by its scenic grandeur and the lovely appearance of the countryside should recall that until Melvil Dewey made things over man was showing himself unworthy of one of the finest places God created in America.

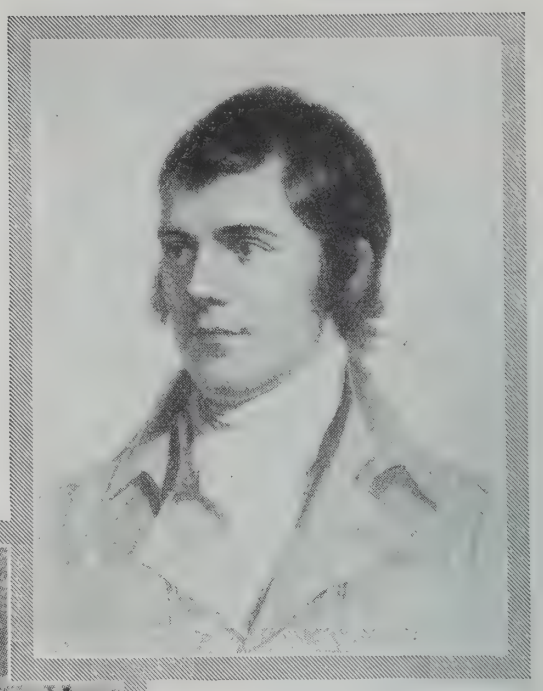
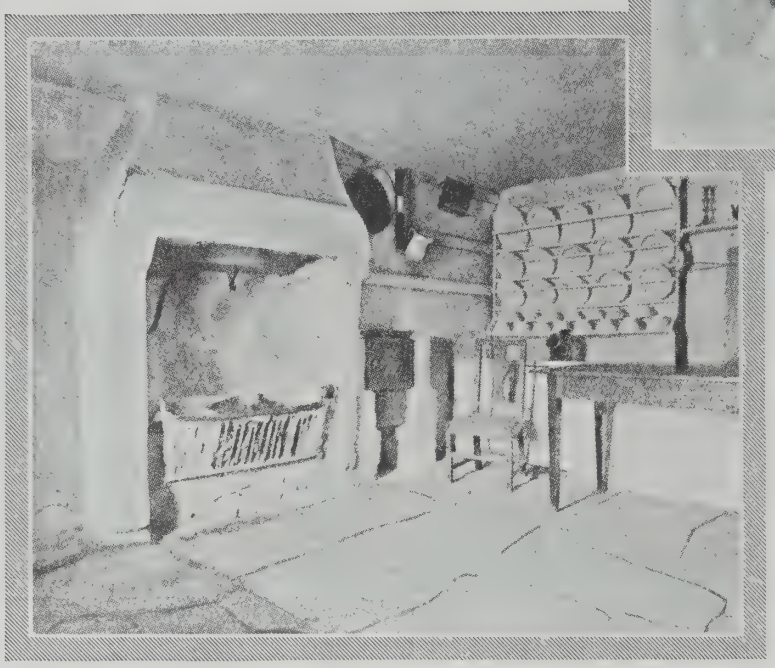
The Country of Robert Burns

In the Footsteps of the Plowman Poet on the Banks of the Doon and Ayr

By PAUL TYNER



ROBERT BURNS



Interior of Burns' Cottage.

IT WAS my good fortune to make the pilgrimage, inevitable for every American sojourner in Scotland, to the birthplace of Robert Burns in Ayrshire during the week of the bard's 165th birthday anniversary.

One begins to breathe Burns, so to speak, on alighting at the Ayr station. It is in the air and in the accent of the people. The Burns tradition is suggested at almost every step. Scotland is tremendously proud of Burns; but that pride reaches its height in the ancient town of Ayr and the country around it. In the public square, only a stone's throw from the station and its fine hotel, Lawson's fine statue of the poet immediately commands the admiration of the visitor.

A few minutes' walk from the statue up High street brings one to the Tam O'Shanter Inn. The name, of course, was given to it since Burns' day, but there is a veritable tradition that the drinking place itself was contemporary with his residence in Ayrshire and that he often foregathered there with his cronies. It is certainly now well soaked with reminders of the bard. Its white plastered walls are surmounted by a moss-grown roof and above the entrance is a large painting of a rural scene—the sort of decoration still common in villages of the Bavarian Highlands, but in Scotland found only on houses dating from the time of our grandfathers. In accordance with the excise regulations, the name of the present licensee of the "Pub," Mrs. Scott, is painted under the picture. Here, we are told quite seriously, Tam O'Shanter was often wont to foregather with Soutar Johnnie:

> "His ancient, trusty, drouthy cronie;
> Tam lo'ed him like a vera brither—
> They had been fou for weeks thegither!"

It is certain that this old inn had been the scene of many a wild wassail in which the Ploughboy Poet himself had been the central figure. One is shown, indeed, the very oak chair in which he sat at the head of the old deal table on which, with scores of other frequenters, he had cut his initials. That one is also shown the veritable chairs (of lesser stateliness) in which "Tam" and "Johnnie" had also sat is evidence that the people of the neighborhood from Burns' day on have identified these creations of the poet's imagination with two well-known Ayr characters. For the benefit of the outlander, it may be explained that "Soutar" is Scottish for shoemaker.

In the same upper room, against the wall on the street side, is a well-preserved and very solid oak chair that belonged to Robert the Bruce—so mine hostess of the inn related with every appearance of deep conviction. Certainly nothing but a veritable relic of The Bruce could be lacking to put the last touch of veneration on this shrine. Such association of the national hero with Burns, too, is eminently fitting, for has not Burns forever immortalized Bruce in his paraphrase of the King's address to the troops on the eve of the Battle of Bannockburn: "Scots wha hae wi' Wallace bled"? I was reminded, too, of the fact that the very chair in which The Bruce sat when crowned, today forms one of the most prized treasures of the collection of historic relics in the Metropolitan Museum of Art in New York.

This upper room in the Tam O'Shanter Inn is reached by a narrow and crooked stair from the back of what was once the taproom, but is now a very dingy and commonplace public bar. The "Private Bar" on the opposite side of the entrance was occupied at the time of my visit by a party of card players, who, without interrupting their game, indicated with the prevalent enthusiasm a spinning wheel in a corner that had belonged to Burns' mother, the ancient brass lantern that was said to have figured in Tam's weird midnight ride, and the very pewter tankard from which the poet had helped to drink the product of the "peck o' maut" that Willie brewed.

A half-hour's ride on a double-deck electric tramcar from the fine Town Hall of Ayr through a pleasant countryside brings one to the Burns' Cottage at Alloway, the humble home where the Poet of Democracy and Scotia's well-loved minstrel first saw the light on January 25, 1759.

> "'Twas then a blast o' Janwar' win'
> Blew hansel in on Robin."

The "auld clay biggin" of two rooms, the usual *but* and *ben* of Scotland, reminded me of the lines of our own Sam Walter Foss expressing the aspiration to "live in a house by the side of the road and be a friend to man." This dwelling place of a crofter that has become a world shrine has undergone many changes since it was built by the poet's father with his own hands in 1757. For a hundred years, indeed, it was used as an alehouse. But its general authenticity is undoubted, and it has been changed far less than that other world's shrine at Stratford-on-Avon.

Little imagination is needed to call before the mind's eye the humble roadside cottage of a century and a half ago, for its original structure is carefully preserved. It is a long, low, one-story building with a slight bend in its line where the cow "byre" joins the family living rooms. There are the thatched roof, the flagged floor and the substantial oak beams and rafters that continue to mark the home of the Scotch peasant-farmer the country over.

Entering the end that was used as a cow barn and milk room (for no yard separates the abode of the family from that of the "beasties") one passes through a small room with a fireplace into the main living room, which also served as kitchen and principal bedroom; the bed being built into a niche in the wall, from which the good "wifie" could keep her eyes on all that was going on. The very spinning wheel and yarn-winder of the industrious mistress of the house, with the table around which the family gathered to hear the father read the Bible in the evening, are all still in their places. In the numerous prints illustrative of "The Cotter's Saturday Night" it is this room that is pictured with its generous high stone fireplace.

Passing out of the cottage and crossing a bit of greensward, one finds a sort of cloistered modern building of brick and cement with red-tile roof running around two sides of the inclosure. In this building is housed, appropriately enough, the Burns Museum. The bard looks down from the walls on all sides from sculptured marble, bronze or clay bas-relief, steel engraving, oil painting and numerous prints. And every one of these portraits has an interesting history of its own.

Among other treasures of the place are Burns' own family Bible in a glass case and open at the record, in the poet's own hand, of his own birthdate, that of his wife, Jean Armour, and those of their children. There were two pairs of twins in succession. Robert, the eldest son, lived to manhood, but his twin sister Jean died at 14 months. The last entry in the hand of William Nicolas Burns, the poet's second son, records the birth of the child born on the day of his father's funeral, July 26, 1796, and named Maxwell, after the physician who attended Burns in his last illness.

This Bible was bequeathed by the poet's widow to their eldest son Robert, from whom it passed to the second surviving son, William Nicoll Burns, who in his lifetime gave it to Mrs. Sarah E. M. T. Burns Hutchinson, eldest surviving daughter of

The cottage where Burns was born, Alloway, Ayr.

Burns' statue at Ayr.

Alloway Kirk.

his younger brother, James Glencairn Burns. As her property, it was sold at auction on December 10, 1904, at Sotheby's in London to Bernard Quaritch, the noted bookseller and publisher of the first edition of Fitzgerald's translation of the "Rubaiyat of Omar Khayyam." Five days later, the trustees of the Burns' Cottage, whose representative had been the next bidder, acquired the precious relic for £1,700 ($8,500).

Nearby may be examined the family Bible of William Burnes (as he spelled the name), the poet's father, and containing the family register. The dates of birth of himself and of his wife, of their marriage and of the births of their seven sons and daughters are entered in the hand of William Burnes; the date when his father "departed this life" is entered by the poet, and that of his mother's passing by his nephew James. Special interest attaches to this old leather-bound quarto by reason of Burns' reference to it as "the big ha' Bible, ance his Father's pride," in "The Cotter's Saturday Night."

An odd reminder of the Scottish bard's contempt for money presents itself in a one-guinea note of the Bank of Scotland dated March 1, 1780, on the reverse of which he had written twelve lines beginning: "Wae worth thy power, thou cursed leaf!" before passing it on. This relic is owned and lent to the museum by Charles Ramsay Gilchrist of Lanarkshire, who would not take many times the face value of this bit of paper to which the poverty-stricken poet's scribble has given a value he little dreamed.

In a neighboring case is a treasure well calculated to fascinate the gaze of the bibliophile, a copy of the famous "Kilmarnock edition" printed by John Wilson in 1786 at the modest price of three shillings. While it cannot be called a "rare" book, only a few copies in the original blue-paper wrapper are known to be in existence. This is one of the few—probably the finest of all—and was acquired from a Paisley collector in 1908 for £1,000.

Of almost as great interest as this little volume of verse is the only known copy of the prospectus issued by Burns with a view to obtaining subscriptions for the edition. It is a vivid reminder that the position in which the poet found himself early in the year 1786 determined him to leave Scotland. He had actually accepted a job as bookkeeper on an estate in Jamaica at $150 a year. Not having the nine guineas required to pay his passage, he arranged to publish this subscription edition of the poems to obtain the money. The almost instantaneous success of the book and the several further editions for which it created a demand changed his plans—and perhaps the whole destiny of the man.

The Burns Cottage collection is rich in original manuscripts and letters of the poet and there are copies of probably 100 different editions of his poems, and nearly as many different portraits. Among recent additions is a collection of 523 volumes in exceptionally fine condition bequeathed by Colonel Robert J. Bennett, V. D., of Glasgow and Ayr, and bequeathed by him to the Cottage in 1916. These are all editions of the writings of Robert Burns and of books relating to his life and work. There are on other shelves separate volumes, printed at various periods, of editions printed in London, Dublin, Belfast, New York and Philadelphia, and of French, German, Russian, Swedish and Gaelic translations.

Among exhibits linking Burns with the New World is a manuscript of Longfellow's poem "To Robert Burns"; the facsimile of manuscript of a poem by Robert G. Ingersoll on "The Birthplace of Robert Burns," presented by John E. Milholland, of New York; a photograph of the statue of Burns at Albany, New York; poems and letters in the handwriting of Robert Burns reproduced in facsimile through the courtesy of William K. Bixby, by the Burns' Club of St. Louis, Missouri, with an introduction and explanatory notes by Walter B. Stevens, a folio printed in St. Louis in 1908, and presented to the Cottage by the Burns' Club of that city; a facsimile of the "Geddes," (1787) Burns which belonged to Bishop Geddes and including facsimiles of a letter of Burns to the Bishop, whom he had mentioned as "the best cleric I ever knew," and thirteen of Burns' poetical pieces in his own handwriting, prepared by the Bibliophile Society of Boston; The World's Memorials of Robert Burns, by Edward Goodwillie, Detroit, 1911, and "Burns' Day in Detroit, 1921," both octavos presented by Goodwillie.

Like Omar Khayyam, it is probable that Burns was not anything like such a tippler as his poems would make him appear: that his indulgence in the flowing bowl, in fact, was more a matter of genial feeling and lyrical celebration of good fellowship than of actual potations. In the Cottage Museum, for instance, we have a "toddy ladle" made of horn and fourteen inches long, said to have been used by him when in Nance Tinnock's Inn at Mauchline; but "Poosie Nancy" told Robert Chambers that "Robert Burns might be a very clever lad, but he certainly was *regardless* of his duty as a good drinker, for he had never taken three half-mutchkins in her house in all his life"—a grudging but no less trustworthy testimony to his abstemiousness.

Not far from the toddy ladle is seen a lock of Burns' hair, said to have been given by his widow to Jean Wilson of Mauchline, a wooden platter said to have belonged to Nance Tinnock, and a walking cane which he used for years, and which was presented by John S. Kennedy of New York.

More important than these personal trifles are certain tangible evidences here that Robert Burns, despite his humble peasant origin and his poverty, was far from being the almost illiterate lout that he has at times been pictured.

A short distance beyond the cottage along the winding country road we come to Alloway "auld kirk" and its kirkyard, made famous by the poet as the scene of the midnight revels of the witches and warlocks with the devil for fiddler—the scene on which Tam O'Shanter gazed almost to his undoing. It will be remembered that he escaped their clutches only by a tail's length, the tail being that of his old gray mare, which was left behind in a warlock's frenzied clutch in the fearful gallop across the Brig o' Doon.

The church dates from the year 1576 and today, as in the poet's day, is almost roofless. The walls, indeed, are so nearly overshadowed by shrubbery and a large spreading sycamore that the ruined vault of the old church suggests a dark grotto in a deep wood. Well might it serve for the unholy incantations and mysterious dances of demons and sprites.

A five-minute walk from Alloway Kirk brings one to the famous monument. It is a pretentious piece of work consisting of a superstructure suggestive of a Greek temple on a massive substructure.

The foundation stone of the monument was laid on January 25, 1820, the sixty-first anniversary of the poet's birth, with full Masonic honors in which twenty-four lodges took part.

Among the many ornaments in the grounds, those that command most attention are the statues of Tam O' Shanter and Soutar Johnnie. They are regarded as the most realistic conceptions of rural life and character ever carved in stone and have been made familiar the world over by countless copies, photographs and prints. The statues are carved from blocks of rough-grained Ayrshire sandstone which lends itself admirably to the delineation of such rustic ideals.

In the statue house and in the monument itself there are a number of interesting relics of the poet and his family, including Bibles which belonged to Highland Mary with inscriptions in Burns' hand, Bonnie Jean's wedding ring, several original manuscripts of the poet and various rare editions of his works, Nance Tinnock's quaich, an engraving depicting Burns' first meeting with Sir Walter Scott, presented by Mrs. Margaret Fullman, of Pittsburgh, Pennsylvania; copies of the Edinburgh *Evening Courant,* of July 23 and 28, 1796, giving the first public account of the poet's death and funeral, also responses to appeals made on behalf of his impoverished wife and family; a facsimile reproduction of the Glenriddell manuscripts gifted to the Alloway Burns Club by John Gribbel, of Philadelphia, and a quaich which belonged to the Jolly Beggars who were wont to gather at Poosie Nancy's Inn.

Within a day's journey from Ayr may be found several places centering about the quaint little town of Mauchline, all of which are filled with reminders of the poet's personal history and suggestive of his verse. In this neighborhood, he grew from youth to man, launched into life on his own account, discovered his powers and gave his first poetry to the world. Here he passed the years that count for most in a man's life, and here the traveler will realize most forcibly what Burns was, what he did, and how he did it. This sentimental journey will include Lochlea, Tarbolton, Mossgiel, Mauchline, Failford, Montgomerie, Ballochmyle—each worthy of at least a flying visit.

Patriotism today is a very real thing in Scotland; strong, deep, intense and warm, it runs in the blood of the people; but when Burns came into the world it was a stream at a very low ebb. The change may be traced to Burns' songs more than to any other one cause. Their music caused the patriotic tide that streamed through unhappy Wallace's heart nearly four centuries before to once more rise and flood the heart of the nation.

Much of the spontaneity which charms the reader of Burns' poems is probably due to the fact that he was like Walt Whitman and W. D. Howells, a self-educated man. He never got away from the simplicity and truth to life which is the high distinction of his lines. Perhaps his humanness might not have survived had his mind been pressed in the academic mold. Thanks to this same humanness, the local and commonplace, under his touch, became national, and the national became universal.

Tam O' Shanter Inn, Ayr.

The Human Side of Our Presidents

Concluded from page 2

manufacturers, President-Elect Madison was clothed in a suit of dark-brown cloth, made from the wool of a merino sheep bred by Robert Livingston at his country seat, Clermont on the Hudson, the wool being carded, spun and woven in his house by his daughter, Elizabeth Stevens Livingston—a practice I recommend to some of the lively young ladies of the present vanity-box era.

In the evening, at Long's Hotel in Georgetown, occurred the first real inaugural ball. Mrs. Madison was dressed elaborately in yellow velvet, with pearls and a turban on her head. Her husband wore a black suit in the evening. Jefferson, who had thrown off his mantle of presidential gloom, was in high spirits at having his part over with. Washington Irving thus wrote of the President-Elect and his wife:

Roosevelt sworn into office at Buffalo in residence of Ansley Wilcox.

"Mrs. Madison is a fine, portly, buxom dame . . . .but as to Jemmy Madison—Ah! poor Jemmy! he is but a withered little apple John." This scarcely does Madison justice. He was a fine type of man.

The present custom of holding the inauguration outdoors (and latterly in the presence of immense crowds) was due to a quarrel which occurred in 1817, when James Monroe was inaugurated, this ceremony being the first one to occur in the open air since Washington was inaugurated in New York. Monroe informed the president of the Senate that, according to custom, he would take the oath in the chamber of the House. The Senate Committee had drawn up an elaborate set of exercises, but before the day came there was a disgraceful row between Henry Clay and the committee over the use of the chamber. Clay was said to have been peeved because Monroe had ignored his desire to be Secretary of State. The quarrel itself centered about the use of the furniture, and so the committee erected an "elevated portico" in front of Congress Hall. The custom has thus been followed since with certain exceptions that were usually due to bad weather. At Monroe's second inaugural in 1821 the fourth of March fell on Sunday, and he took the oath in the House. Four years later John Quincy Adams was also inaugurated under cover, on account of bad weather.

It was not until 1829, at the inauguration of Andrew Jackson, that any real excitement occurred again. John Quincy Adams had all the family traits. He moved out on March 3, refusing to recognize Jackson. A pamphlet reflecting on the private characters of Jackson and his wife had been distributed by Adams' supporters; the death of Mrs. Jackson added a note of tragedy to an already tense situation. Jackson refused to call on Adams, who responded in kind. The only uniformed company of soldiers in Washington declined to escort Jackson, and a company of Revolutionary veterans finally tendered their services. When Jackson got back to the White House he threw the doors open to the populace, and his followers trampled the furniture and raised hob generally. These wild scenes seem strange to us now; they were a part of our governmental training. At the second inauguration of Andrew Jackson, Justice Marshall (now coming to be recognized as one of our greatest Americans) made his last administration of the oath to a President. Martin Van Buren, four years later (1837), rode to the Capitol in an open carriage which had been specially made for the occasion from the wood of the frigate *Constitution*. In 1841, when William Henry Harrison was inaugurated, it was a cold, stormy day, a northeaster blowing. The President-Elect read his address with uncovered head, and the exposure is said to have hastened his death, which occurred a month later. At the inauguration of Tyler in 1841, Daniel Webster was the most commanding figure in Washington. That was the period in our oratory when the classic note was predominant. All speeches reeked with Greek and Roman quotations. Webster had helped with the inauguration address. He was living in a boarding house in Washington at the time. Coming back to his home after his labors his landlady said to him, "Mr. Webster, you certainly look tired." "Why shouldn't I be tired?" he replied, "I have just killed seventeen pro-consuls."

The inauguration of Lincoln, in 1861, was naturally the most dramatic event in the history of our inaugurations with the exception of that of Washington. It is highly interesting to contrast descriptions of Washington and Lincoln in their respective deliveries. William Maclay, Senator from Pennsylvania, thus described Washington's appearance when he delivered his address in front of Federal Hall, New York: "He was agitated and embarrassed; kept putting his fingers, first of one hand and then of the other, into his breeches' pocket." Maclay observes that he wished the Father of His Country could have been first in speech making as in everything else.

Lincoln appeared on the stand in a new suit, carrying a gold-headed cane and a silk hat, together with his speech. At the moment when he was about to begin, he was at a loss where to put his hat. Douglas, his political rival, stepped forward and took it, remarking either then or later, as an aside, that if he himself couldn't be President at least he could hold the President's hat. Henry Watterson, who was present, thus described the incident:

"The President that was about to be seemed entirely self-possessed; not a sign of nervousness, and very obliging . . . . When Mr. Lincoln removed his hat to face the vast throng above and below, I extended my hand to take it, but Judge Douglas, just behind me, reached over my outstretched arm and received it, holding it during the delivery of the address. I stood just near enough the speaker's elbow not to obstruct any gesture he might make, though he made but a few; and then I began to get a suspicion of the power of the man. He delivered that inaugural address as if he had been delivering inaugural addresses all his life."

In connection with these two contrasting pictures, I cannot but recall one occasion, when Woodrow Wilson was governor of New Jersey, and his boom for the presidency was being launched. It chanced that I presided at a dinner tendered to him in Newark, New Jersey. It was one of those democratic dollar dinners, about two thousand persons being present. Just before he rose to speak, he turned to me and said quietly, "I have never been able to overcome my nervousness before speaking." Yet he showed not a trace of it in his manner, and his appetite struck me as exceptionally hearty.

In this brief survey I can refer only to the most illuminative incidents. Andrew Johnson was sworn in after Lincoln's assassination in his own rooms at the Kirkwood Hotel.

Grant's inauguration was marked by the greatest military display in our history up to that time. His daughter Nellie, a mere child, suddenly ran forward to her father and held his hand while he spoke.

Rutherford B. Hayes was sworn in secretly on Saturday night, March 3, the fourth of March being on Sunday. There was a dinner party on hand and when he quietly left the table no one knew why. He took the oath again on March 5, on the eastern portico of the Capitol.

Garfield was inaugurated in the presence of his aged mother, the first mother up to that time who heard her son deliver his inaugural.

Grover Cleveland, at both of his inaugurations, used the little Bible his mother had given him when a lad.

Roosevelt's inauguration was not only tragic, on account of the assassination of McKinley, but dramatic. He was in the Adirondack Mountains at the time, and for some hours could not be located. Three relays of horses were used and torch bearers had been placed along the road to light his way to the railroad station at North Creek, 35 miles from where he received the news. He was taken in a special train to Buffalo, which he reached about 1:30 p. m., having covered 500 miles by foot, horse and train in nineteen hours. At half-past three he was sworn in by John R. Hazel, judge of the United States District Court, the ceremony taking place at the house of Ansley Wilcox, of Buffalo. His second inauguration, in Washington, 1905, after he had been elected President on his own account, was a very brilliant affair, 500,000 spectators being present. "Teddy" wrote to his friend, Sir George Trevelyan, on March 9:

"Many of my old friends with whom I lived on the ranches and worked in the roundups in the early days came to see me inaugurated."

Taft was inaugurated in a blizzard, at least he would have been had it been possible to hold the ceremony as usual outdoors. Shortly after he was inaugurated I called on him one day in his office in the White House. He told a number of funny stories and while talking to me and a friend, Knute Nelson, the Senator from Minnesota, came in. My friend introduced some other people to Senator Nelson and then turning to me said:

"Senator, this is Mr. Masson; he is from New York; I hope you don't mind meeting a man from New York!"

Senator Nelson did not relax the severity of face as he replied:

"Well, I sometimes *have* to."

Mr. Taft's laughter almost shook the foundations.

Some idea of the crowds at an inauguration can be gleaned from my personal experience at the inauguration of Woodrow Wilson in 1913. After the ceremony I started back to New York; there were at least fifteen thousand persons in the Pennsylvania Railroad Station. I stood up, wedged in the crowd there, until three o'clock in the morning. Once I squeezed near a cold radiator and jumped up and sat on it, but a guard wormed his way through the crowd and got me down. Finally, at slightly after three a. m., I managed to sneak by the gates leading to the railroad tracks. A serried and silent row of sleeping cars greeted me. I went along until I saw one that looked as if it might start soon. I got into a forward sleeping car, the beds of which had all been made up. Pushing aside curtain after curtain until—at the extreme end—I discovered a lower berth that was empty, I crawled in with my clothes on, shivering with fear. The train started. Suddenly, after a long black space had enveloped me, I felt an arm, and a voice whispered very loudly, "Ticket!"

I handed the intruder my railroad ticket and a fiver. There was a hideous silence. Finally change was thrust back at me. The conductor knew that the poor devil who had engaged that berth never got there and now never would.

The next morning I woke up, and the tremendous flood of the previous day's crowded experience swept over me. Woodrow Wilson, the twenty-eighth President of the United States, had been sworn in. I thought of his firm jaw, of his angular body, of the pleasant and desultory conversations I had held with him; of the genial Tumulty, of the blighted George Harvey, of the colorful and belligerent woman suffragists—of everything, in fact—except the great thing that was coming: *a world war.*

Well, now it is Calvin Coolidge. And who knows what next?

Table of Presidential Inaugurations

No.	Name	Inaugurated	Time Served
1.	Washington,	Apr. 30, 1789	7 yr. 10 mo. 4 d.
2.	John Adams	1797	4 yr.
3.	Jefferson	1801	8 yr.
4.	Madison	1809	8 yr.
5.	Monroe	1817	8 yr.
6.	J. Quincy Adams	1825	4 yr.
7.	Jackson	1829	8 yr.
8.	Van Buren	1837	4 yr.
9.	Harrison	1841	1 mo.
10.	Tyler	1841	3 yr. 11 mo.
11.	Polk	1845	4 yr.
12.	Taylor	1849	1 yr. 4 mo. 5 d.
13.	Fillmore	1850	2 yr. 7 mo. 26 d.
14.	Pierce	1853	4 yr.
15.	Buchanan	1857	4 yr.
16.	Lincoln	1861	4 yr. 1 mo. 11 d.
17.	Johnson	1865	3 yr. 10 mo. 19 d.
18.	Grant	1869	8 yr.
19.	Hayes	1877	4 yr.
20.	Garfield	1881	6½ mo.
21.	Arthur	1881	3 yr. 5½ mo.
22.	Cleveland	1885	4 yr.
23.	Benjamin Harrison	1889	4 yr.
24.	Cleveland	1893	4 yr.
25.	McKinley	1897	4 yr. 6 mo. 10 d.
26.	Roosevelt	1901	7 yr. 5 mo. 18 d.

Shopping in Soochow

Concluded from page 6

When I got home I showed it with commendable pride to a caller. Later the boy, who had been in the room serving tea when I showed it, came to me and said, "Missie, when you make die?" I answered that I had no intention of dying. Then said he, "Where catchee that thing?" pointing to the tapestry which I had tacked upon the wall, the better to show its beauty. "More better you pay me that thing, missie, you no wanchee." But I did "wanchee" (want it) and was curious to know why he was so sure I didn't, or why he refused to go alone into the room where it hung. So one afternoon when my son's Chinese teacher came I showed it to him, and he told me it was a death blanket, a cover for the dead! Truly it would not make an acceptable present for an old and very dear friend.

Crying baby which added to the noise when I went shopping in the city. This is a Chinese baby high chair.

My son's teacher is a highly educated old mandarin, courtly and polished in the ways of a bygone China. What I had purchased as a gift was a "Toulo," he said, a coverlet made for the dead of a certain religious faith. Its inscriptions were taken from the "Sin-diminishing" scripture written by the great King Wei Te, centuries ago,and are thought to be of great help and profit to the dead. Therefore, when a man dies his family, if they can find the money, secures one of these coverlets, and places it in the coffin over the dead man, covering him from head to foot. Said the old teacher:

"With the help of this cover all the sins of the dead man will be henceforth diminished, and he will not go to hell to be transformed into a starving devil or into any of the lower animals. Instead, with this coverlet over him he will go immediately after death to the Land of Purity in the West. In case the dead has heavy sins—too heavy to allow him to go to the Land of Purity—this coverlet has the power to cause him to be made a human being again, thus giving him another chance and if he lives his second life in a clean and decent way, he will go to the Land of Purity after all."

I could not help but wonder if the teacher himself believed this, but somehow I could not ask him. He explained, however, that such coverlets were often not within the means of families who wanted to get them for their dead. In such cases the inscriptions can be copied on pieces of paper, and these little bits of paper pasted on the forehead, throat, breast, knees and feet of the dead, and their sins will be diminished just as well as though they slept under a whole cover.

That "Toulo" coverlet is laid away in the bottom of my treasure chest, and will lie there till I get back home. After that it will hang on the walls of my living room; but I could not give it as a present even to my best friend.

Robert Burns' Great Faith in America

Worthy of Special Remembrance at the Birthday Celebrations

By CAMERON TAYLOR

"I PROPOSE as an amendment the health of George Washington, a better man!" Thus Burns the poet, lover of Liberty, threw aside once again the fetters which penury and a government appointment had laid upon him, and amazed a public gathering which had just been asked to pledge the health of Pitt, Prime Minister of Britain!

Throughout the English-speaking world, on January 25, coteries innumerable meet to honor the poet on the date of his birth; and it seems not unmeet in these days to take the minds of his admirers to that point whence, one hundred and thirty years or so ago, he visualized the young Republic of the West, and declared his faith in America.

It has been said that not until the French Revolution did the Scottish poet take any noticeable interest in politics, yet it must be abundantly clear—remember the times in which he lived—that the sturdy farmer lad of seventeen, who with a friend was severely taken to task at Kirkoswald school for daring to enter upon discussion of speculative questions—was indeed his father's son so far as interest in the affairs of the wider world was concerned. The question on the occasion which brought down upon him the wrath of the teacher was—Is a great general or a respectable merchant the more useful member of Society? The teacher, it is recorded, contemptuously dismissed the question in favor of the general, and thereby proclaimed the feeling of his time; but, drawn into an argument with the irrepressible Burns, the dominie was so worsted in presence of his pupils that he wrathfully dismissed the school.

To Robert Louis Stevenson we are indebted for a picture of Burns' father which must come to many a Scot throughout the world as a picture of one he has known: "Chill, backward, and austere with strangers, grave and imperious in his family, he was yet a man of very unusual parts and of an affectionate nature . . . . Nothing is more characteristic of the class in general, and of William Burnes in particular, than the pains he took to get proper schooling for his boys, and, when that was no longer possible, the sense and resolution with which he set himself to supply the deficiency by his own influence."

This was the man who grounded Burns in principles, none more cherished than the principle of Liberty:

"Here's freedom to him that wad read,
Here's freedom to him that wad write;
There's nane ever feared that the truth
should be heard
But them wham the truth wad indite."

This is the Burns who hailed, in America, the exemplar in the struggle for Liberty!

A noteworthy outburst is recorded of him in the days prior to his appointment as a government official. He had achieved success; the great folks of Scotland's capital had lionized him; he had toured his native land, and been knighted by Mrs. Bruce, who had inherited the helmet and sword of Scotland's most renowned chieftain, and who claimed that "she had more right to confer the honor of knighthood than some people." Then an utterance by a clergyman stirred his wrath—the clergy, it must be acknowledged, never had any difficulty in doing that—and he indignantly wrote:

Auld brig o' Doon, Alloway. Familiar scene in land of Burns.

"I daresay the American Congress in 1776 will be allowed to be as able and as enlightened as the English Convention was in 1688; and that their posterity will celebrate the centenary of their deliverance from us as duly and sincerely as we do ours from the oppressive measures of the wrong-headed house of Stuart."

The Convention referred to was held in connection with the dethronement of James VII and the transfer of the English and Scottish Crowns to William of Orange. Burns, however, like most Scots of the time, had a sentimental regard for the house of Stuart, and some lines which he wrote at Stirling during his tour were so strongly in favor of the dethroned house that he was severely taken to task about them when, later, he applied for his appointment as an exciseman.

The picture of Burns, who in his seventeenth year and later was the associate and companion of the bootleggers of the time on the wild coast of Carrick, toiling late and early as a law-enforcement officer of excise, possesses some interesting lines. It was among the smugglers of the Carrick coast, he writes, "that I first learned to fill my glass." Yet as a law-enforcement officer, in his first post, he had no light task, for on his rounds of inspection, week in, week out, he had to cover on horseback more than 200 miles; and his salary was only £50 per year. He did his work zealously, but when Liberty spoke the Bard kicked the harness of Departmental tradition to ribbons.

There is sheer ferocity in his "Address of Beelzebub" to certain prominent Scots who, to quote the poet, "took part in a meeting to concert ways and means to frustrate the designs of five hundred Highlanders who were so audacious as to attempt an escape from their lawful lords and masters whose property they were, by emigrating to . . . . the wilds of Canada, in search of that fantastic thing—Liberty." Here, again, the example of America is first in his mind, as witness the lines:

". . . . Let them ance out owre the water,
Then, up amang thae lakes and seas,
They'll mak what rules and laws they please:
Some daring Hancock, or a Franklin
May set their Highlands bluid a-ranklin';
Some Washington again may head them . . . ."

The sturdy ex-ploughman was no lily-handed law-enforcement agent, either. His zeal could not be denied. When an armed smuggler cast anchor in the Solway, it was Burns, then a £70-a-year exciseman at Dumfries, who called for a troop of dragoons, led them himself, was first aboard the brig, and did his part in beating down resistance and capturing the ship. And when the ship was sold as a prize, the lover of Liberty again struggled out of the exciseman's uniform, bought four small cannon off the ship, and dispatched them with a letter to the French Convention. English officials stopped the guns and the letter at Dover, and Burns was given to understand that, as he himself put it, he was "muzzled."

The admiration of the poet for Washington, and the faith in America which is enshrined in some of his work, had a deeper root than in the resentment which prompted this unruly civil servant to rise among his fellows in Scotland and call upon them to drink "To the last verse, of the last chapter, of *Kings!*"

The "Ode for General Washington's Birthday" is eloquent of all that America meant to the poet. "I am just going to trouble your critical patience with the first sketch of a stanza I have been framing as I paced along the road," he wrote. "The subject is Liberty: you know, my honored friend, how dear the theme is to me. I design it as an irregular Ode for General Washington's birthday."

It is undoubted that in the Britain of the day there was a great body of opinion solidly against the Crown in the matter of America, but only the experience of the years has shown that the lesson read to her by her kith and kin in America has saved for Britain her own Empire. Burns had faith in the men of "man's imperial line,"

". . . . Sons of Liberty,
Columbia's offspring, brave as free,
In danger's hour still flaming in the van,
Ye know, and dare maintain, the Royalty of Man.

Some of Scotland's memorials to Robert Burns. Left—Monument at Alloway, world's first tribute to Burns. Center—Burns' mausoleum. Right—Burns' memorial at Mauchline.

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Lire," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

A perfectly preserved grain of wheat was found embedded in a piece of pottery used by a Sussex woman 2,600 years ago. It is on view in the Municipal Museum at Brighton, England.

The engagement ring is worn by Germans and Scandinavians on the third finger of the left hand during the engagement, and on the right hand after marriage.

The popcorn stand is another American institution unknown in Europe.

Diogenes, seeing a ruined profligate making a meal of a few olives, said to him, "If you had dined so, you would not be supping so."

Men are changed to coyotes after death, the Indians of the Klamath tribe in Oregon believe, and they have so opposed the work of the government trappers that there are more coyotes on the Klamath Reservation than in any part of the Northwest.

When Roman numerals were used, before the use of figures, all calculation was done with the abacus.

Seventeen states are represented among the 53 members of the football squad of the University of Pennsylvania.

A honey bee gives off a scented trail when it finds a new source of supplies, that other bees may follow through the air.

Chicago's horses decreased by ten per cent during 1923, and motor-driven vehicle licenses increased nearly ten per cent.

The "Fly paper women" of Paris streets wear fly paper hats when they call their wares.

The largest sheep station in the world is at Tierra del Fuego, the most southern part of South America. One company shears more than 2,500,000 sheep every year.

The Royal Society of England reports a hen which laid eggs and hatched chickens but later in life gradually became a rooster.

A valentine formerly meant a young lady betrothed to a man on the first Sunday in Lent. The agreement was annulled if he did not give her a present on the 14th of February.

Sundays in winter as many as 50,000 Germans pay ten cents each to walk on the ice at Muggle sea just outside of Berlin.

Football in England is first distinctly mentioned by William Fitzstephan in his History of London, 1195.

Webster's Dictionary, first published in 1828, was preceded over 900 years by a Latin dictionary compiled by Varro in 116 B. C.

England has developed more improved breeds of livestock than all the rest of the world together.

The guinea is really a wild game bird. In Africa, where there are still many wild flocks, they are highly prized by hunters.

A letter addressed to the "Christian & Devil World, Philadelphia, Pa.," was safely delivered at the office of the *Christian Endeavor World* in Boston, where it was intended to go.

The exquisite painter Ko-tsu was often reproached by an industrious friend for his fits of idleness. At last he excused and explained himself by saying, "You are a watermill—a windmill can grind only when the wind blows."—Allen Upward in "Scented Leaves from a Chinese Jar."

Rood Day is celebrated in Scotland in memory of the invention of the Cross. On this day branches of rowan are set above the doors of cow-houses and tied by scarlet thread round the tails of cattle to keep witches on the move.

Wyoming is known as the Equality state on account of having been the pioneer in woman suffrage.

The durability of white pine is illustrated in a house at Salem, Massachusetts, which was sided with white pine in 1684 and today, after 240 years, is in an excellent state of preservation.

The actual voices of Florence Nightingale, Lord Tennyson, Queen Victoria and Gladstone are preserved by means of phonograph records now in the British Museum.

Gold is one and a half times heavier than lead.

Junior and Senior as applied to two Senators from a state refer to length of service, or date of election, not to the age of the men.

Fifty women have been added to the Buenos Aires police force, to patrol the parks. Their uniform is a black straw hat and a navy blue dress.

Armed with long poles, two men are periodically engaged to dislodge pigeon eggs from St. Paul's Cathedral in London. The eggs, when left to roll off to the street below, often prove a nuisance.

The longest filibuster speech ever delivered in Congress was made by Senator Robert M. La-Follette, of Wisconsin, in 1909 when he kept the floor for nearly nineteen consecutive hours, including one entire night. He was blocking a currency bill.

Eighty per cent of the crime in this country is committed by men or boys who have had no religious training, says Albert B. Hines, director of the Boys' Club of New York City.

One man walking the length of the *Shenandoah*, the United States Government airship, when the engines are not running, changes her level three degrees, so carefully is she balanced. After the ship is under way the men can move at will, as the elevators by their resistance to the air keep her trim.

"I Read in the Papers—"

I READ IN THE PAPERS that the new head of the Department of Justice is cutting out the old detective tricks. It is about time. The Department never fell so low as when it was used for political purposes. Competent men on the staff were ashamed of their associations. That is all past, it seems. Mr. Hoover is working on another tack. It was always my opinion that the best head for the Department would be a newspaper man, but as Mr. Hoover is a lawyer we shall see what kind of a chief he makes. He will at least know enough to discriminate between the material that satisfies a detective and the kind that will pass muster in court.

I READ IN THE PAPERS that Rev. John Roach Straton preached on THE DEARBORN INDEPENDENT'S studies on the Jewish Question and concluded that in the main they were right, but that they only proved that God was fulfilling His promises to His Chosen People by giving the world into their grasp. Now, the Jews are not God's chosen people and they haven't got the world in their grasp, neither are they going to get it. It is surprising that a clergyman like Dr. Straton should make so curious an error. But, then, ministers usually know so very little about their textbook, the Bible. Nowhere in the Bible is Judah or the Jews spoken of as the "chosen." Israel is the Chosen. Israel was the progressive, constructive nation (ten tribes out of thirteen) that broke away from Judah. When Israel went out, it carried the promise of world dominion with it on its shoulders. Let Dr. Straton look it up, tribe by tribe. If the Jews are the Chosen People, the whole structure of Bible prophecy and Bible racial theory falls down. Israel is the Chosen, and if the Bible be true, Israel is ruling, leading, enlightening and serving the world today, and is Christian. Judah doesn't fill the prophetic, nor even the historic bill at all. Judah has power, but for ill, and for anti-social uses. Judah is not Israel. Dr. Straton probably thinks that because he is not a Jew he must be a Gentile. He could be an Israelite without being a Jew. It might be an interesting exercise for Dr. Straton to try proving to himself that he is a Gentile. I'll bet him he can't do it.

I READ IN THE PAPERS that Boston had an earthquake. Boston newspapers did not conceal the fact. The Boston *Transcript* began the story with deep headlines on Page One and carried over for several columns. It appears that Boston and vicinity are no strangers to earthquakes. For the period between 1638 and 1870 there are records of 208 quakes. The incompleteness of the records since 1870 is not accounted for.

I READ IN THE PAPERS a great deal of talk about that old bromide called law enforcement. It is a good guess that few people ever read an article with that in the headline. The reason is, they have no confidence in the methods or men engaged. Law enforcement is as simple as a b c. If the officers of the law *personally wanted law enforcement,* it would come. They get anything else they want. It is not police stupidity, it is police indifference, or even connivance, that permits such an oversaturated condition of law violation as we now have. The trouble is, our law enforcing agencies feel *no moral opposition to much that goes on.* Does anyone pretend for a moment to believe that when a converted naval cruiser is captured five times by the government, and each time sold back again to the rum runners, it is due to police stupidity? You give the police and other law officials a *grievance* against bootlegging, and see how quickly it will vanish!

I READ IN THE PAPERS much comment on the new biographies of Robert Louis Stevenson, and it divides into two groups: an expression of glee that Stevenson has at last been found to have some spots on his career; and an expression of angry grief that the plaster saint aspect of Stevenson has been destroyed. It is a delicate question how far the truth should be stated. I happen to know that when the biography of one of the best-loved Americans was being prepared there were anxious conferences over the fact that he was father of a child before his marriage. What to do about it in the biography? It was the general opinion that were the subject himself alive he would have said, "If you must tell anything, tell the truth." At the same time the question persists, what good will it do? What use will it serve? What is biography anyway? What matters most about a man, his work or a momentary folly? I suppose the general public would be in favor of printing it all (most readers of this paragraph are desiring to know who the dead great man is of whom I am writing), but it is a question whether we would vote for the same treatment of ourselves. How would this rule do: "He that is without fault, let him do the writing." What we would not whisper about a friend to his disadvantage in life, is of no consequence after his death. Does Truth necessarily include the elements of gossip?

MR. FORD'S Page for this week discusses one of his favorite ideas—Pioneers. The greater pioneering remains to be done.

AARON SAPIRO'S widely heralded announcement that he has "sued" THE DEARBORN INDEPENDENT, which, by the way, is not a fact at this writing, is given brief comment—page 8.

JUST because you see the word "taxation" in the caption of the article on page 2, don't pass it over as "dry." It is anything but that. It is a mighty human article, on a most humanly important subject, by a writer who knows. It is very significant that home-owners are no better off than tenants were 15 years ago—all on account of taxes. Taxes are not figures; they are human energy.

THERE is a delightful view of the back yards of the Vatican on page 4. An American made acquaintance with the miller of the Vatican mill and was received into a community which not one tourist in a million ever suspects of existing.

GENERAL Feng is widely known as the "Christian general" of China. But his capture of Pekin involved a question of ethics. Was it Christian, or not? Our writer, on page 10, does not spare General Feng, but then she is judging by the aboveboard, straightforward instincts of the American. Another sidelight on the matter may be found in "I Read in the Papers."

THE rage for Russian fiction should be tempered or mingled, at least, by considering the facts brought out on page 5.

JEAN MOWATT writes of the "Fashion Scouts" and gives a deal of worthwhile information on the perennial subject of style in clothes. (Page 11.) Most of us had no idea of the world of thought and effort that lies behind the fashions. They are American styles, of course.

THEN Senator Overman emphasizes an old American doctrine much neglected today—the right of local rule. (Page 9.) "Were we directed from Washington when to sow and when to reap, we should soon want bread." Americans are forgetting the fundamental doctrine that puts the brake on over-centralized political control. There is solid value in this article.

DRILLING for steam—digging a well for heat—that is what they can do in California. What this may mean in the way of power for Pacific localities is a question: but the fact of subterranean steam boilers, filled and heated by nature, makes an interesting story. Page 6.

DID you know that Massachusetts maintained a Marine School to train officers for the Merchant Marine? It is a sign that American sailors in command are not to disappear from the great waters. The lark there is in learning is well told on page 3.

THE old horse and buggy—the horses hoofs, tlot, tlot, tlot on the road, the odor of the harness, the sway of the carriage, the ease of dreaming and driving, too—can you remember? Then you will probably like the romance of the buggy as told and illustrated on pp. 12 and 13.

In the Bottomless Pit of Taxation

Exploring the Route Taken by Fifteen Per Cent of Country's Wealth; Can Some of the Barnacles Be Scraped Off Hull of Government Ship?

By ALLAN BENSON

FIFTEEN per cent of all the wealth that America produced last year was poured into the bottomless pit of national, state, and municipal government.

That is what was taken from us by taxation. Nobody escaped. Those who paid no income or real estate taxes were nevertheless taxed. Their taxes were concealed in their living expenses.

This is an astounding state of affairs. Nothing like it ever before occurred in the history of the country. Nobody would have believed, 15 years ago, that such a situation could arise. It is so unnecessary.

Fifteen years ago, we used to look to our national, state and city governments to protect us from those who would plunder us. We might as well stop looking in their direction. They themselves have become the greatest of all the looters. Mr. Coolidge is trying to compel Congress to take less from us, but the state and municipal governments are running wild.

Our troubles began when American politicians learned that the American people would consent to pay heavy taxes.

When "Watchdogs" Were Popular

Prior to this discovery, there had been a widespread belief among politicians that we would not stand for much taxation. This belief was so generally held that politicians traded upon it. If a man wished to become popular he had but to grow a bushy beard, go to Congress and become known as the "Watchdog of the Treasury." Allen G. Thurman, of Ohio, added a red bandanna to this outfit and achieved such renown that in 1888 he was put on the Democratic national ticket with Grover Cleveland. There was never much in the Treasury for Thurman and the other "watchdogs" to watch, but that made no difference. People liked the spirit of the thing.

Politicians everywhere took notice and kept taxes down. The national government spent so little that nobody was ever conscious that it cost him anything. The national government was entirely supported by customs duties paid by foreigners and trifling taxes on tobacco and whisky.

The discovery that the people would consent to bear heavy taxes was made after the Constitution had been so amended that Congress could tax incomes.

Of all the absurd things that have ever been suggested to the American people, nothing was so absurd as the suggestion that the poor could be helped by taxing the incomes of the rich.

In the first place, the National Government, in those years, cost so little that nobody was conscious that it cost anything; so how could any one be helped by the mere shifting about of a burden that was already so light nobody could feel it?

During those years I was writing in advocacy of every measure I knew of that seemed to me likely to promote the public welfare, but I am proud to say that I opposed the income tax proposal on grounds that have since been justified a thousand times over. I am quite pleased that I was able to write the article entitled "The Income Tax Delusion" that was printed in the January (1911) number of *Pearson's Magazine*. I mention this only to show that my present views concerning the income tax are the ones I have long held.

The most serious aspect of the income tax is that *it opens the door to colossal waste.* The principle was adopted in the belief that if the rich paid more the poor would have to pay less than they did before we taxed incomes, but nothing of the kind has happened. Nothing of the kind has happened because it is not the nature of politicians to spend less than all upon which they can lay their hands. *If the income of the United States Government were ten times as great as it is, Congress would have no difficulty whatever in finding ways to spend every cent of it.* It was therefore utterly absurd to assume that if Congress were provided with a fresh source of income it would correspondingly decrease its other sources and thus relieve the poor.

Giving No More Than Necessary

Congress is composed, for the most part, of men who have made politics a profession. There are, of course, exceptions. But the majority, like the members of every other profession, want to make it pay. The only way they can make it pay is to keep themselves on the pay roll. The only way they can keep themselves on the pay roll is to build up and maintain a political machine that will produce enough votes at each election to keep them in Washington. The only power that can move a political machine is money. Jobs must be provided at government expense, for the human cogs in the machine. Every appropriation of public funds carries with it some sort of political advantage for the Congressmen who put it over.

Whoever does not know this knows little about Washington. What is true of Congress is true of every other legislative body in the country, state and municipality.

Obviously, the thing to do is to let them lay their hands upon as little money as possible. The thing to do is to give them no more than is necessary to carry on the government—national, state or municipal, as the case may be. The proof that this is the thing to do is afforded by the fact that *as long as we did it taxes were low.*

Another fallacy of the income tax idea is that the incomes of the rich can be taxed for the benefit of the poor. If the fortunes of the rich consisted of gold locked in a bank vault this would be true. But the fortunes of the rich, from which their incomes are derived, consist of investments in American industry. The moment a business man's income is taxed, it adds the tax to the cost of doing business. The tax is thus paid by those who do business with him. In other words, the tax is shifted to the people of the United States. In practice, the shift is not made quite so simply as that. Obstacles are often encountered. Conditions may be such in individual cases that to increase prices may be to drive business elsewhere.

> City taxes are so high now that home owners are no better off than tenants were 15 years ago.
>
> Taxes are now as much as was formerly paid in rent.
>
> Taxes amount to just as much as we let the politicians have. If we let them have less, taxes will be less.
>
> If we gave the government ten times as much as now—but we couldn't; we give 15 per cent of all income now, ten times as much would be half as much more than we have—but if we did, it would all be spent.
>
> The two-cent stamp does no more than it did 25 years ago—but taxes are higher.
>
> "We are fortunate," says Mr. Benson, "to have a President whose New England training makes him an expert in not spending money."
>
> Our Government existed 125 years without income taxes, and can hardly exist now with them.

The United States Government is now taking, by various forms of taxation, from three to four billions a year. The state and municipal governments are annually relieving the American people of approximately twice as much more. As stated, all of them together take 15 per cent of what we produce.

This constitutes an exceedingly serious economic waste. If what is wasted were devoted to developing the country, everybody would be benefited. Instead, everybody is harmed except the army of tax-eaters and others who are living at the expense of the public.

Taxes in cities are now so high that the owners of houses are no better off than tenants were 15 years ago.

Taxes now amount to as much as was formerly paid in rent.

Ownership means merely that one has bought a place for himself on his city's tax roll.

Wringing Out the Taxpayer

In every great American city, and in many of the small ones, the problem of the politicians is to devise methods of wringing more taxes from the people. Wherever there is a debt-limit placed by law there is an effort to evade the law by arbitrarily increasing the valuation of property, wholly without regard to whether the value has actually increased.

Every year, the owner of a house learns that his city government has added a few hundred dollars to the assessed valuation of his place, thus enabling the tax-eaters to tax more money out of him.

It might surprise the American people to know how many American cities are, to all intents and purposes, bankrupt—loaded with a bonded debt representing the limit permitted by law and barely able to pay interest charges and running expenses even after the collection of almost confiscatory taxes.

Municipal taxes have increased, in the last 15 years, from 300 to 400 per cent. What are the people given in return for this increase? What better are schools, fire departments, pavements, health departments, and so forth, now than they were before the war? No better. Everybody knows it.

When Politicians Can't Be Trusted

The people of this country will have to fight their politicians in this matter of waste or the present tremendous burden of taxation will never be decreased. Such a row should be made about excessive taxation that as soon as possible taxation shall become the most important political issue. In city, state, and nation, men should be elected to office who are pledged to reduce expenses to the lowest point consistent with necessary service.

And, above all, an insistent demand should be made that income taxes be decreased. As long as incomes are taxed at all, this demand should be repeated. The whole income tax idea should be whittled away until there is nothing left of it. Our national government existed for more than 125 years, with the exception of a short period during the Civil War, without taxing incomes. We can get along without taxing incomes, but we cannot get along if governmental waste and extravagance are to go on from bad to worse. Yet waste, extravagance, and excessive taxation are bound to continue just as long as we permit our politicians, city, state and national, to have at their disposal large sums of money.

Politicians are not to be trusted with full treasuries. They have not the business judgment nor, in some instances, the public conscience to make good use of public funds. As long as there is money in the Treasury they cannot stay their hands. Ask them to retrench and they say it is impossible. Ask them to cut off the barnacles that are clinging to the government and they reply that every barnacle is necessary to the conduct of public affairs. The retrenchment that has been made since the close of the war has been made only because of the insistence first of Mr. Harding and later of Mr. Coolidge. And that was not the result of good management or business initiative, so much as of political and partisan necessity.

Mr. Coolidge is performing a very fine service for the United States in stressing economy as he does. Congressmen may laugh at him—they do laugh at him. One of them said the other day that he thought the President was "overworking" the economy idea. But as long as there is a shred of the income tax left, the economy idea cannot be overworked. We are fortunate to have a President whose New England training makes him an expert at not spending money. The value of such a President and the danger of too much money in the Treasury were illustrated the other day. The big navy gentlemen had the skids all greased to raid the public funds for more ships. Mr. Coolidge interfered. First, he authorized a White House spokesman to say that the administration did not care a hoot what naval forces other nations might have, and that the President's only concern was that this country should have enough force to make it safe. A few days later he caused Secretary Hughes to make a gesture of friendship to Japan and to deny that there was the slightest justification for the reports that Japan was preparing to attack us. These two thrusts laid the big navy bogey and prevented a big raid on the Treasury.

High Income Tax Means High Prices

We are tremendously indebted to the President for taking the stand that he has taken in favor of a return to economical government.

The politicians of the nation need to be reminded, as he is reminding them, that the people of this country do not care to turn over to legislative bodies 15 per cent of our annual production of wealth.

High income taxes mean high prices of commodities, and high prices of commodities mean a reduction of the number who can afford to buy.

In other words, high income taxes mean less production, less work, less wages, less consumption—in short, less comfort and less happiness.

Every commodity that is on the market today could be sold for less and therefore be made available to more persons upon easier terms if our national, state, and city governments were not taxing us so heavily.

There is certainly something wrong when even well-disposed persons feel that most of the money they pay in taxes is wasted. In cities we must have schools, fire and police protection, pavements, lights, and so forth, and, therefore, we must expect to pay taxes, but not nearly so much as we are paying. We look to the state for country schools and good roads, the latter of which are provided for in the taxes upon automobiles. We have never been able to see that the state did much for us, and until the present orgy of spending began, state taxes were in proportion to the services performed by the state.

The national government has always seemed, in a sense, to be even further removed from us. It has carried our mail and we have paid for it. It has enacted and administered laws. It has done little else and we have asked it to do nothing else. The two-cent postage stamp does no more than it did 25 years ago. Enacting and administering laws doesn't cost much. That is why our national government, until incomes were taxed "to help the poor," cost so little that nobody was aware that it cost anything.

It is interesting to note that the State of New York taxes incomes, that the politicians of some other states have unsuccessfully tried to saddle their constituents with state income taxes, and that in the State of New York, at least, *municipal income taxes* have been proposed.

Calling a Halt on the Politicians

New York will be a fine state in which to live if the day shall ever come when its citizens will be compelled to pay *three income taxes.* But the move for municipal as well as state income taxes shows the danger that faces us. *The politicians will never stop wasting and spending until we give them nothing to waste.*

The best way to begin that job is to smash income taxes wherever they are found, driving for reduction after reduction until nothing shall be left.

Their Life Is on the Ocean Wave

Floating School Where Young Men Are Trained for the Merchant Marine

By MAY B. WHITING

ALL WINTER long, from October until May, there lies moored beside the municipal pier at North End Park in Boston a strange looking craft. From water to rail there are the slim, graceful curves of a yacht; above the rail she bulges in fat, unseamanlike lines, with masts protruding almost pathetically, as if some overgrown insect had tried to spin itself a cocoon and had left a leg or so sticking out into the cold world.

Nor is the approach to this floating curiosity too easy. Before you reach the wharf, a sentry, very young and correspondingly businesslike, stops you, and if you can give a satisfactory account of yourself you may proceed, evidently under suspicion. From the pier the impression is quite different, for there is none of the deathlike stillness of a cocoon, but a stir and keenness of life that the rough boards and tarred paper of the housing cannot wholly confine.

This craft is the Massachusetts Nautical School where a hundred and sixteen young men, sons of citizens of the state, are training for officers in the Merchant Marine. The boat itself, the *Nantucket,* is loaned by the United States Navy. It is an iron steamer of 1,261 tons, barkentine rigged, that is, its foremast is rigged square and its two other masts in schooner fashion. Its length is 244 feet, its beam 32 feet, and it draws 15 feet of water. It is equipped for wireless, has a steam capstan and steering gear, and a complete electrical outfit.

The school year is divided into two terms, the winter and the summer. During the former the boat is housed in and heated by steam. The spar deck becomes a study hall and classroom, with blackboards and armchairs for writing. Except for vacations the pupils live on board ship the year around, shore leave being granted when in Boston from Friday evening until Sunday afternoon.

The studies are much the same as those of the advanced classes in a high school, with the addition of engineering, seamanship and navigation, including such subjects as laws of storms, compass error, ship's plans, dead reckoning, nautical almanac, tides, and ocean currents. The cadet also begins to acquire the "sea habit." He sleeps in a hammock and goes to his duties at the call of the bugle or the boatswain's whistle. On fair days he is sent to row about the harbor in one of the ship's boats and he commences to learn about rope ladders and to make his first ascent over the masthead, perhaps with a fearsome attempt to "squeeze the tar out of the rigging."

The student begins to understand also the talk of a boat. He learns that "'vast heaving" means to stop pulling, that to do a thing "handsomely" is to do a little at a time, that when he is hauling on a rope and a stopper is put on it, the order "up behind" means for everyone to let go; he finds out that "port your helm" turns the boat to starboard, and that if one leaves his belongings "adrift" about the decks they are likely to wind up in the "lucky bag" from whence it takes some trouble to extricate them. He may learn also that dreadful word "gob," hated by officers, but which seems likely to flourish along with the navy.

The cadets are organized among themselves with officers corresponding to those commanding the ship. There is the "cadet master," a youthful captain with four gold stripes upon his sleeve, and beneath him, the three under-officers, each with one stripe less. Then there are the ten petty officers, from first class down to carpenter's mate and cadet quartermaster. The engineering division has its "stripers," too, each with his responsibilities and suitable insignia.

The student's life is nothing if not busy. All the work of the boat, whether at the pier or at sea, is done by the cadets under the supervision of the officers. It is a long day, full of study and work and drill, with not a chance for a dull moment and not much time for outside diversion. Every Wednesday night a lecture is given on shipboard on some subject of marine interest, and four times a year the deck becomes a dance hall for cadet hops. The school always has a baseball team with a creditable record, and its own orchestra and field music of six buglers, two infantry drums, a bass drum, and cymbals. There is a good library of technical books and fiction and, at sea, the books are exchanged Saturday afternoons.

The first of April the housing comes down and the boat begins to get ready to spread her wings for a seaward flight. From the Navy Yard the ship's boats are brought out and hoisted on davits, a thirty-foot motor boat, a sailing boat almost as large, a cutter-pulling boat, two whaleboats, and the dingy.

Early in June the anchor is lifted, and, with farewells from the shore, the boat moves slowly down the harbor for the 13,000 miles of cruising ahead of her. Then, for many a youthful sailor whose seagoing experiences have been confined to a trip on the ferry, the bête noire of his dreams pokes his head up among the roses. In spite of officers' recommendations to eat as usual, sometimes a cadet will sit mournfully on deck until his comrades carry him forcibly to the mess room. There, the jolly companionship of his fellows restores his spirits and he finds his ills have vanished and his appetite returned. By the time they have made their first stop at Washington, each one feels himself an old salt, tolerant of the shore, but anxious to get off again across the blue Atlantic.

Studies are continued while cruising, but the work is largely practical. The engineers are divided into three sections or "watches," and the deck division into two, one of which takes instructions below while the other has seamanship on deck. If winds are fair, the boat proceeds under her own sail, and a black ball is hoisted to show that she has the right-of-way. In adverse winds, the sails are down, down comes the black ball, and the engines start their throbbing.

Day begins early on shipboard. At 3:45 the watch

The trim little boat outward bound.

is called, at 4:30 the deck is scrubbed with sand, and 5 is the time to "call idlers." At 6:45 the order reads to "get sheets home, yards trimmed," meaning, in the language of the shore, to tighten the ropes on the sails. After breakfast, at 8:30, comes "Turn to. Bright work"; in other words, get busy and polish up everything in sight. Then, while the watch below has instructions in problems like laying the course and determining the distance run since the previous noon, the deck watch has such practical work as sight taking and standing the watches. Usually, too, there is some kind of a drill from "man overboard" to "abandon ship," in which each cadet knows exactly what he is to get—bread, water, crackers, paper, a sextant, and so on—and the boat can be cleared in something less than a jiffy.

In the afternoon at 3:30, when the watch below of the morning has had his turn of seamanship on deck, comes the order, "Pipe sweepers. Scrub clothes." Each boy has a clean suit of "whites" every day, and every afternoon the soiled ones are scrubbed. They are laid flat on the newly cleaned deck and each cadet, with scrubbing brush, salt-water soap and plenty of ocean from the ship's hydrant, gets to work. At 5:30 the clothesline is "triced up" where it stays until the next morning without the slightest danger of thieves disturbing the laundry.

From four to eight are the short watches, "dog watches," where, if the weather is good, there is time for recreation. The cadets gather up forward, play musical instruments, or perhaps try boxing or other athletic games. These are the gala hours for the mascot, or Rex, the ship's dog, who has learned sea routine from A to Z, and knows quite well the proper time to start a frolic. At 8:30 there is silence on the lower deck, at 10 lights are out, and, except for the watch on deck, a busy day is over.

In port the routine is somewhat different. At 9 o'clock at night the anchor watch is set. This is an emergency watch in case the ship should start to drag her anchor. Several cadets must pass the night on deck, but only one of the number is required to keep awake. In the morning, at 5:45, comes the order, "cadets over masthead," and here it is not only the mainmast of the winter term, but thirty-five feet of topmast above that. And then every day there is shore leave for the "liberty party." That is the great event for the youthful sailor when he really begins to see the world.

"The first foreign port I was ever in," recounted a six-foot cadet, tanned and rugged, and straight as a young tree, "was Ponta Delgada in the Azores. I thought I'd seen some foreigners around here, but I never saw anything like the big black fellows that came rowing out by hundreds, it seemed to me. We call them "spickies" or "bumboatmen." I was gangplank sentry that day and it was my business to keep them from getting on the boat. They brought canaries, and wicker work and strawberries and pineapples. They looked good to us but we weren't allowed to have any that the ship's doctor had not inspected. I was some scared, but I kept saying, 'Shove off,' and they'd shout back, 'You wait till you come ashore and we'll shove you off.' When it came my liberty turn I kept in the middle of a crowd of fellows, you bet. It was fun to go into the restaurants there, but we never knew where to put all the escudos we got for change.

"Our next stop was Queenstown and the first person aboard was an old Irish woman. She got a big husky to row her out and she brought laces."

"Laces for cadets? Did she sell any?"

"Sure she did. All the fellows bought stuff to send home to their mothers, and so forth, and we were all growling because the officers wouldn't let us have more money. You know when we start out we put our cruise money, about forty-five or fifty dollars, in charge of the executive officer and he gives it out to us in the different ports where we'll enjoy spending it most. It was lucky for us we couldn't get hold of it all at once.

"Our next stop was Falmouth. We saw there the *Cutty Sark* and on the River Fal was one of the boats that had been in the battle of Trafalgar. One day we all marched down to a creek and took part in laying the cornerstone of a monument to the Pilgrims who had started from Hull. In London we went up to Tower Bridge and moored there. We stayed twelve days and had a good chance to see Wembly."

"Of course, you found that wonderful?"

"Oh, yes, it was all right, but, say, we landed in Hull right in the middle of a street fair. They had gravity roads that an American primary school kid wouldn't waste his time on, and a merry-go-round that crawled. We stood and stared and wondered where the pleasure came in. Not a thrill in sight."

But the gentle English scenery made a deep impression, and so did the beautiful Seine up which they cruised to Rouen. Sometimes a whole village would assemble on the banks to wave at them and sometimes the village band would play for them as they passed. The old city of Rouen with its cathedral towers, its medieval streets with the river flowing through the center, left them rather bewildered, but Paris, with its overflowing life, its never failing gaiety, its friendly welcome, made good every anticipation.

"What was the best of all," said my friend, "every one tried to make us have a good time. Of course, sometimes we acted a little green. In the apartment house where we stopped three of us cadets got into one of those elevators you run yourself. Our room was on the top floor so we thought we'd let her have full steam. She went up all right, but then we couldn't stop her, so she went down and then she started going up again. We pressed everything in sight but nothing made her stop. She carried us up and down four or five times till the juice ran out or something and then she left us on the ground floor and we had to walk up. What did we like best in Paris? Eiffel tower.

At Gibraltar they felt, not homesick, of course, but very far away from home. That is one of the gateways of the world, and the mixture of nations, the preponderance of swarthy skins, made them feel alien and alone, as they wandered past the shops and admired the curios from every land. The first stop in a home port was Provincetown where they painted the boat inside and out, and by October they were back in Boston.

In the middle of October comes graduation, and the students who have completed the two years' course take leave of their Alma Mater. Almost immediately their places are filled, the sails come down, the housing goes up, and, except for the echo of storms that sway her at her moorings, and the "yarns" that the sea dogs of a year's experience spin for the new cadets, the great adventure on the high seas is over.

In the trade winds, topsail lookout aloft.

Back Door Pictures of the Vatican

A Humble Cicerone Affords Some Glimpses Into a Little-Known World; Activities of an Industrious, Self-Supporting and Law-Abiding Community

By JUDSON GRENELL

FEW of the hundred thousand tourists who annually visit Rome and register with the police department see the back doors of the Vatican. Most of them see St. Peter's, the Vatican gallery, the Sistine Chapel and St. Peter's tomb. Half of them, maybe, climb to the great dome and obtain a view of the Pope's beautifully laid out flower and shrubbery garden. But the back doors of the Vatican are different: they are seldom seen by the visitor. Yet these back doors tell a story all their own. There they are, in daily use. Through them one gets a glimpse of the activities of a self-supporting, industrious and law-obeying community.

The Vatican buildings that stand within frowning battlements have many back doors. They comprise a country within a country as well as a city within a city, the sequestered home of the popes—"prisoners" by choice these many years—and the headquarters from which issue the government of the Roman Catholic Church.

High and thick walls, built centuries ago, encompass acre on acre, devoted in part to agricultural purposes; land enough, if intensely cultivated, to maintain a considerable population. Here are poultry yards, fruit orchards, vineyards and vegetable gardens and pasture land as well where, should occasion require, cattle could be grazed to supply the Vatican household with cream, milk, butter, and even meat.

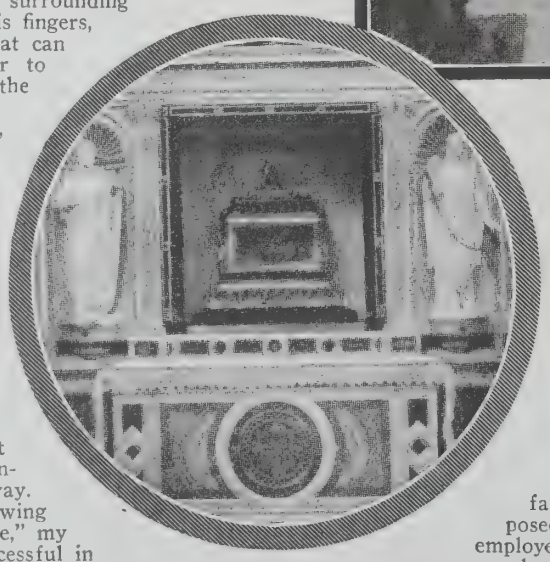
There are said to be some 16,000 or more rooms within the Vatican. But not many realize that if put to it, the Vatican might close its massive gates and for a while at least be a self-supporting community. Italians are individualists. They prefer to work for themselves rather than have a better wage and be at the bidding of a "boss." This determination finds expression within the Vatican's walls, for here are to be seen little shops, mayhap employing, in addition to the proprietor, an assistant and a boy—an apprentice learning the trade.

Just how many of these little shops there are, the writer does not know. No record of them is open to the outside world. Nor is it generally known how many crafts are followed. Yet numerous employments are carried on; there are workmen not only catering to the demands of those living within the walls, but selling their surplus in the city.

One business inside the Vatican wall is that of flour milling. Through a happy introduction to members of the miller's family, one day outside the walls, I was afterward taken inside, the guards at the gate through which we passed making no objection. It is not much of a mill, judged by American standards, but of a size commensurate with the other commercial activities of the Vatican's individualistic and wealth-creating population. The flour mill gives employment to a half-dozen men. Except occasionally, it does not run more than three or four days a week.

The wheat here ground into flour comes from America, Sardinia, and Italy. It is possible that, since commercial relations have been resumed with Russia, a bin may hereafter be reserved for Russian wheat. At any rate Russian wheat is now being shipped into Italy. The miller refused to commit himself. A shrug of the shoulder was the only answer to the question.

"Ah," exclaimed the miller, and his eyes sparkled as he fondly let the Italian wheat, raised in the campagna surrounding Rome, run through his fingers, "this is the wheat that can be ground into flour to make bread fit for the Pope's table."



The mill is old, though in a good state of preservation. For how many years it has made flour for Vatican households, no one could tell. Today it is equipped with up-to-date machinery, so that it is able to compete successfully in the Roman market for the Roman trade.

I had this fact brought to my attention in a peculiar way. Interested in knowing "how the Romans live," my wife and I were successful in securing board with a mechanic's family in one of the newer sections of Rome, and only a short distance from St. Peter's of the Vatican. And, by the way, there are other churches of St. Peter in Rome—St. Peter in Montorio and St. Peter in Vinculis. One of these has on exhibition, on special occasions, the very chains with which St. Peter is said to have been bound.

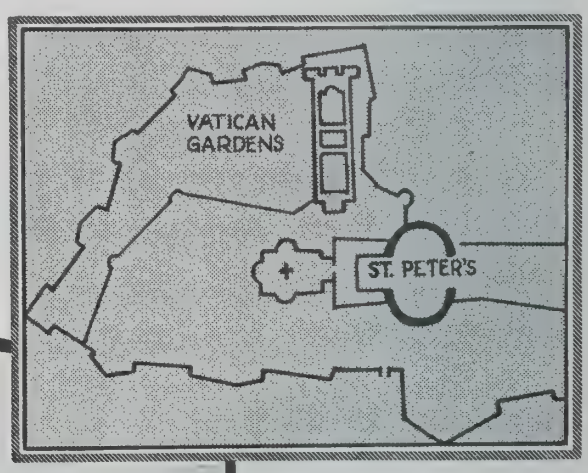
We lived in an apartment house, having an inner court where there was a well-cared for, beautiful garden, with a fountain—though both garden and fountain were small. From this court ran four arched entrances to fifty apartments. In the basement several activities were being carried on, the principal one a bakery for the creation of fancy sweets native to Italians. Here six men lived and worked. And this bakery used the flour made by the Vatican mill.

The Vatican mill is made of brick similar in appearance to those ascribed to the Middle Ages, and is two stories high. In one end of the mill the machinery fills both stories. In the second story of the other end are the quarters of the miller's family. The living apartments are reached by stone steps of recent construction. The rooms are large, with high ceilings and great casemented windows which look out upon the back doors of the Vatican.

From this vantage point the view is intensely interesting. One cannot fail to note the number of women working in the Vatican inclosure. Some were gardening; some were feeding the poultry; some were attending to household duties, including the humble but important task of washing clothes and putting them on the line to dry. Children were playing on the meandering street, and the usual number of cats and dogs, which in any other country than Italy would be an unusual number, were sunning themselves, or sleeping, lazily indifferent to the strangers within their gates.

While one day sauntering through the Sistine Chapel, a guard kindly opened for me a door leading to a balcony. From this was obtained a fine view of the Pope's residence and the garden in which he walks. It was all very beautiful and peaceful, yet to me it did not compare, in interest, to the view from the windows of the mill.

The dining room in the mill is furnished in a style to make the searcher for antique furniture green with envy. In the center is a table with fifteen chairs—just enough to seat the miller's family. Three generations are present at every meal, with a possibility that in due time a fourth will be added. Time was when, mayhap, in that dining room, if not around that particular table, daily gathered not only the miller's family, but also his workmen and apprentices, in true guild style. Nor is the guild formula for carrying on industry extinct in Italy. There is a hint of it in Dictator Mussolini's ambition to make his beloved nation still more prosperous. He is demanding that manufacturers form trade associations composed, in part, of representatives of their employes, and he forbids workmen to "strike" or employers to use the "lockout."



Above—Map showing relative positions of the Vatican, Vatican Gardens and St. Peter's Church, Rome. Center—St. Peter's Church, Rome. The large structure in the right background is the Vatican. Circle—Arrangement for displaying chains of St. Peter.

The mill kitchen glitters with polished copper cooking utensils, and across one end is a great stove for charcoal. The average Italian family knows no other fuel, and it is wonderful how much an efficient Italian housewife can accomplish with a few handfuls of charcoal, sometimes in an earthen crock, though generally in a metal container.

Wonderful to see, in the mill's living apartments was a bathroom, with all the modern accessories. As if to emphasize this twentieth century touch, a second bathroom was being built in. Not one Italian residence in a hundred has a bathroom! I have seen Italian palaces without bathrooms. Indeed, as originally built, they had no conveniences whatever.

In the Vatican mill the Middle Ages and the twentieth century truly meet, for it now contains many things of which earlier generations did not dream. Mysterious electricity, for example; for the mill is powered and lighted by electricity with electrical heaters in use to take from the living rooms the chill of a Roman winter.

Of St. Peter's (Vaticano St. Pietro) to describe its wonders and treasures, many books have been written. Every one knows that the central nave is 608 feet long, 89 feet wide and 145 feet high. The cupola, or dome, the conception of Michaelangelo, measures 138 feet in diameter and is 405 feet from the ground to the top of the cross outside. But St. Peter's is only one, though by far the largest, of the Vatican structures. But to me, more eloquent than the thronged portals of St. Peter's, were my luckily discovered back doors which give upon the peaceful human life of the Vatican—they were more eloquent than the great entrance to St. Peter's, with its 284 basilica columns and its 166 statues of the saints of the church.

In contrast to the humble Vatican back-door activities, here recorded, is a great room in one of the buildings immediately adjoining St. Peter's, given over to the manufacture of mosaics, some of them worth a thousand lire a square foot. Here the artisans are also artists, even though only copying with colored bits of stone what painters have put on canvas. Here are art treasures worth having. The tooth of time is apt to destroy paintings, but mosaics retain their pristine brightness as long as soil and stone retain their color.

After all, the great back door of the Vatican, and which all who desire are welcome to use, is the entrance to the Pinacoteca or picture gallery. It is nearly a mile distant from St. Peter's square, in the rear of the basilica. The approach over the rough cobblestone pavement is no pleasure-day walking. The pleasant way to reach it is with the aid of a taxi. Up grade all the way, one goes on and on until, when the door is reached, it is seen to be guarded by tall Swiss guards in their historic gorgeous uniforms.

In gaining this door we were fortunate in our guide. He was a lad not over seven years old, who bowed in true Italian style, or at least in the style he had been taught, and with the enthusiasm of youth pointed to us the objects of interest.

The great back door through which is gained access to the Vatican art collections has no distinguishing characteristic above the other great doors in which Italian architects of the old school delighted, and which modern architects copy; but it opens to the visitor a wealth of statuary and paintings and articles of virtu that few if any other doors can match.

Through this same door the Vatican Museum and Library are also reached. Scores of books have been written describing what these rooms contain. It is sufficient to say at this time that through no other back door in the world can there be reached so much that is worth seeing and studying.

Other doors in the vatican hold interest, even though they are not back doors. One might mention two. There is the door to the Sistine Chapel, which is reached by a narrow stairway located at the end of the Geographical Map gallery. The chapel is one of the marvels of the many marvelous things in the Vatican. Then there is the ingress to the Borgia apartment at the end of the Vatican Library. Here grouped together are the halls of the pontiffs, the Mysteries of the Life of Jesus, of the Saints, the Sciences and the Credo. Doors on doors, yet after all not the doors that held for me such thrills as those first seen from the balcony of the old mill.

It was one of the greatest pleasures of my Italian journey to meet the kindly miller who ushered me into the little-known world which is seen through the back doors of the Vatican.

Is Fiction Russianized?

Muscovite Influence May Be Partly Perceptible But American Ideals Are Being Kept Uppermost

By LEWIS WORTHINGTON SMITH

THE influence of Russian fiction upon the American novel has for some time been a thing of moment. Into fiction almost the whole of Russian literary effort has poured itself. For that reason Russia is understandable in a large measure through an understanding of the stories that her fictionists have told. The consequence has been that we have read Gogol and Dostoievski, Turgenev and Tolstoi widely, and, because of our sympathy with Russia in her misfortunes, have given them a very friendly hearing. Naturally their way of telling stories has reciprocally affected not a little our own creative methods.

Russian fiction differs from English and French fiction in being comparatively structureless. It lacks relatively what may be understood in brief as plot. That may be defined as the structure exhibited in the movement of a series of incidents toward a crisis the outcome of which becomes more and more doubtful until the author presents his solution of the difficulty involved and brings his story to an end. Whether a story should or should not have plot is partly a matter of time and place. America has followed the English and French tradition in accepting organization as more or less a fundamental in fiction. Probably in some respects we have gone further in so ordering our fiction than they have in either England or France.

Suspense and Surprise Endings

A STORY, whether long or short, is a thing of life as it is lived. Life in America has as its chief motive action. Crudely action is merely a succession of things happening. More fully understood it is the product of will pushing itself on to realization. Plot and action go together. The struggle that is the expression of will is essential to developing action. Nothing is more characteristic of our English-speaking world, of the occidental world in general as differing from the oriental or the semi-oriental, than pleasure in the exercise of will in the conquest of obstacles. When obstacles do not present themselves in abundance for us, we create them in games and sports. Golf and baseball, football and cricket are notifications of that drive of our temper and our tendencies.

It is only in part a law of literary art that stories shall have structure and that the backbone of that structure shall be a plot bringing the incidents to a climax and then to a resolution. The reason for it in art is primarily in ourselves, in the fact that we are an active people, that we like to go forward to the accomplishment of something, and that we enjoy achieving what we achieve in the face of difficulties.

The fiction of a people, perhaps more than any other product of their activities, is a reflection of the spirit of that people. None the less literature does not follow life with the avid thirst for literal and definite particularities that distinguishes the work of a reporter on the track of a murder. Some one has very wisely said that art is art because it is not nature. The artist is an artist rather than a reporter only in the degree in which the material that life offers him he reduces to some form that will make it more appealing to the fundamental desires with which we have ourselves observed that same material. For those of us to whom the expression of will is an elemental necessity, the problem of writing a story, on the structural side, is then a problem of piling up hindrances to the progress of the chief character and helping him to overcome them or seeing to it that they overcome him. Ordinarily here in America we have found the greater pleasure in the triumph of the man. That is not because we like happy endings as such. It is because will resides rather in the man than in the obstacles. It is consequently more vital and human for the will to carry through.

At the present moment any reader may observe that this structural formula is not being overworked. For a few years we have not been settled in our wills. Our actions have been more or less fluttering and indecisive. The plots of our stories are consequently more or less reflections of our own instabilities. If a writer wishes to roll in the gutter, after the fashion of a great deal of our current fiction, if he does not care to go courageously along the street, he need not worry much about plot. No exercise of will is involved in that sort of conduct. No stretch of the muscles in the pull of struggle is called for. He may surrender to the destinies and offer thanks before his icon if he escapes with his life and is given a dry crust and muddy ditch water as a means of subsistence. If again he wishes to sentimentalize, whether in the fashion of "Pollyanna" or of "The Sorrows of Werther," he can get along very well without either a beginning or an end.

At a high level it is possible to write stories in the reflective and meditative style of a James or a Meredith and not make much effort to keep the reader excited over the various fortunes or misfortunes that are in the end to be allotted to the principal actors in the story. It can be done only by the writer whose literary skill is so high and unfaltering that he can count on entertaining his readers as much by his story-telling as by the story he tells.

Now and then it appears that authors are interested merely in setting or in character, that is, in still life. The potentialities of character and even of setting may develop into the movement of story. They do so somewhat reluctantly, however, and we should not expect much American fiction to have that inspiration. It is itself a sort of passivity. Properly enough it may be a literary mode for Russians and for Orientals. It is suited to any life that has either reached a goal or is seemingly without a goal, to any life that for any reason is stagnant or thrown back upon itself, any life that is not happy in marching to a drumbeat, that would rather sit and wring unavailing hands.

Suspense is one of the first things to be attained in the ordering of a plot. That may seem to be nothing more than an arbitrary rule of literary dictators, but it has its source deep in human nature. Life itself has zest almost entirely through its uncertainties. For Western eyes at least, the may-be or may-not-be of the future has a lure that the settled, however beautiful or wonderful, never can achieve. Among peoples in whom the instinct for change is lower it may probably with sufficient justification be different. Where today is like yesterday and tomorrow will be like today, it is hardly to be expected that suspense can count heavily in story-telling. The novelist may drift on in a dreamy monotony with ennui the only conceivable goal.

Struggle and suspense, will and its goal, go together in the story. There should be a point in its course where struggle and suspense cease. In our Western fiction we have come to place that as near the end as possible. Sometimes in our endeavor to meet the demand for continued suspense we have pushed the resolution to such an excess of the unnatural as we see in the surprise ending of an O. Henry story. There is a suspicious air of artificiality in that sort of management of the plot. It seems rather a bit of the author's cleverness than something taken out of life and put down white hot on the page. Art may sometimes be pure artifice, but it must not seem artifice or it goes cold.

The reading of stories of that sort lures us on to the conjectural outcome and satisfies us, not by what we conceive of as the possibility of a human experience, but by what we fancy the author may be able to twist out of the entanglement into which he has plunged his characters. That is not, I take it, a legitimate story interest. It has no more validity than is to be found in a freak mystery play like "The Bat." It is not interest in life, but interest in the tricks of a literary sleight-of-hand performance. Then it becomes interest in the performer himself, curiosity with regard to what he can do next and what means he will employ in doing it. It is the sin of too much attention paid to plot, and, if the Russian influence can help us to avoid it, there is in that possibility a sort of compensation for other tendencies in it less in agreement with our American spirit.

Realism Essentially Russian

THE business of organizing story material into a satisfying structure is a process of selection. Some happenings are to be reported and some are to be omitted. In our Western fiction, English, French, American, the selective process is always noticeably at work. In Russian fiction it is hardly observable at all. Certainly the selection that the Russian writer may make is not based on any organic unity either in the thing presented or in the effect the writer wishes to produce. Within briefer compass than that of the story whole this literary method as an absence of method exhibits itself perhaps most conspicuously in passages of description. As in the following from Tolstoi's "Sebastopol," the Russian simply reports all details regardless of their relation to a possibly harmonious whole:

"The staff-officer, small in stature, with a swollen and bandaged cheek, walked up and down, dressed in a frock-coat of fine cloth which bore marks of long wear. He was decidedly corpulent, and appeared about forty years old. A bald spot was clearly marked on the top of his head; his thick mustache, hanging straight down, hid his mouth; his brown eyes had an agreeable expression; his hands were fine, white, a little fat; his feet, very much turned out, were put down with a certain assurance and a certain affectation which proved that bashfulness was not the weak side of the commander."

Perhaps there is nothing more to be said about this than just that it does illustrate in brief the Russian tendency. In that, of course, it is essentially realistic, even to the point of literalism. That is, no doubt, its justification in theory. No doubt also that is the reason that it has found acceptance among American realists and has considerably altered their technique.

Recognizing this, however, and seeing that it so has on it the stamp of one of our warring literary creeds, we should further recognize that this literary method is necessarily one of passivism. In the employment of it the artist surrenders himself to the fact; he does not take possession of the fact and use it. That is not a Western way of looking at life, not a Western way of living, not a Western way of reincarnating life in art. In the regions overlooking the Ural Mountains and farther east it may be natural and fitting. As yet, however, despite the evident Russian influence in such novels as "Main Street," we have not chosen to leave ourselves and our racial destinies behind us and chart our way through the fogs.

Land Ownership in Hawaiian Islands

By WM. LEE CALNON

Honolulu, Hawaii—

LAND ownership in the Hawaiian Islands has so recently been made possible for individuals, that the announcement of a new subdivision going on the market is a news sensation and "makes" the first page in the newspapers. So small is the amount of land available thus far, that it is sold by the square foot, not by the front foot, and prices are high.

From the time the first Maoris arrived here from island groups to the south, through all the hazy, legendary period of Hawaiian history up to recent times, land ownership was simplicity itself. It all belonged to the kings. The king owned the island and parceled it out as he pleased among his favored subjects. In the latter part of the eighteenth century King Kamehameha the Great became the Napoleon of Hawaii by subduing all the lesser kings and making himself the sole ruler of the archipelago. This simplified land ownership to the nth degree. Kamehameha owned it all. The islands remained under one kingly line, Queen Liliuokalani being the eighth and last monarch. She was deposed in 1893 in favor of a republic and five years later the islands were annexed to the United States.

One subdivision of land ownership had occurred before Queen Lil was deprived of her throne. Bernice Pauahi, of the royal line, high chieftess and princess, and her family, owned about one-fourth of all the arable lands in the kingdom. The rest still pertained to the crown and this land came under the ownership of the republic and later under that of the territorial government established by the United States.

Gift of a Volcano

BERNICE PAUAHI married Charles R. Bishop, a missionary from Boston, and held intact her great holdings of land until about thirty years ago. She left them to the Bernice Pauahi Bishop Trust, tied fast. She provided that the trust be administered by seven trustees, all of whom must be non-Catholics, and who are appointed by the Supreme Court of the territory as vacancies occur.

In that trust she left all her properties to be conserved and administered almost entirely for the education and advancement of native Hawaiians. (This includes half-castes.) There was established the Bishop Museum, the Kamehameha school for boys and girls, the Bishop Memorial Hall, a part of the Industrial Farm, and a wing built and maintained at Queen's Hospital. The trust is entirely eleemosynary. It pays no taxes from which churches and charitable institutions are exempt. About a half-million dollars paid as income tax was returned by a decision of the United States Supreme Court.

Until the past ten years it was the policy of the trustees not to sell any land, but to let it out on long-term leases. As a great deal of the land in the trust was located in the heart of Honolulu that policy retarded the development of the city. As newer and more modern trustees came in control they began to sell off some of the land as an aid to the growth of the city and its business.

You are told here by leading men of the city that the Bishop Trust has been extremely liberal in fostering agricultural and industrial development. It has leased land for as long as fifteen years without any rental and an additional fifteen years with nominal rent or acceptance of a portion of the land's produce as payment. In that way coffee, tobacco, and other industries have been enabled to get a start.

Much of the most desirable seashore property on Oahu Island (Honolulu), also included in the trust, has been leased for long periods at easy rentals. Included also in the trust was the volcano Kilauea, on the island of Hawaii. The trustees made a gift of the volcano to the United States Government and it is now a part of a great national park established by the government. The rest of the arable lands are mostly under long-term leases to sugar and pineapple plantations.

The big sugar companies also own great properties, some of which they purchased prior to annexation of the islands and some of which they have acquired since. Very nearly all the rest belongs to the territorial government and it, too, leases big tracts on long-term leases for agricultural purposes.

The present Federal laws prevent the territorial government from disposing of large areas at a time. But the law does permit the establishing of homesteads on small areas. These average about 25 acres of arable lands and run as high as 80 acres where the land is partly barren. The homesteads are auctioned off. Over on the "big island" of Hawaii are many pretty bungalow homes, with their acreage stretching behind them, that have been built by homesteaders. The government also portions out house lots at rentals of one dollar a year, when the need of them is demonstrated.

Curiously enough, the parceling out of property still follows to a degree the ancient Hawaiian custom of allowing for pasturage. The old kings and chiefs, while retaining full ownership, used to grant subjects pieces of lowland or beach property with running water on it or to it. This was the "kuleana." With it went the "kula," or piece of foothill property behind, suitable for pasturage. Then the native raised his vegetables, rice and taro, a bulbous root from which the native food "poi" is made, and was happy. As long as his chief liked him he had no other worries over the land ownership.

Demand for land space has grown by leaps and bounds in Honolulu and the rest of the island of Oahu in recent years. The population has doubled each decade for the past thirty years and is now estimated at 125,000.

Tapping the Steam Boiler of the Earth

Power Which Has Gone to Waste for Hundreds of Millions of Years

By EDWIN MORRIS

Here we see the first well. Drilling the second with more than 900 horsepower to spare.

HOW long ago was the earth made? At least a hundred million years ago. Perhaps three-hundred million years. What are a few hundred million years, more or less, among friends? The thing we are trying to get at, anyway, is steam. Ever since the earth was made there has been a great steam boiler under California. It has been generating steam night and day all of these hundreds of millions of years. If, from the beginning, the steam had been converted into electricity and sold to the anthropoid apes, Indians and white men at regular rates the company that owned the boiler would long ago have had all the cocoanuts, furs, and money on earth.

But all through these endless centuries nobody cared a hoot about the boiler—though it was large enough to heat a valley ten miles long and a mile wide. The apes did not care, the Indians did not care, nobody cared until J. D. Grant, of Healdsburg, California, came along. Grant cared and people said he was crazy. Grant said he would drill wells and tap the boiler if it took every cent he had been able to make in the gravel business in Healdsburg. He had to drill because he could not be still. Ever since he was a boy, he had heard steam hissing from crevices in the rocks and seen boiling springs gush up from a hundred places. He lived near by and the "hot ground" of Alexandria Valley was a place where he always had to wear his shoes. The first time he burned his feet he began to think. He thought until he had made enough money to act.

That was about two years ago. Then he began to drill his first well. He chose a hot place where steam was coming from the rocks. He used a pipe 7⅝ inches in diameter. It went through rocks, volcanic ash and then into rock again. When it was firmly embedded in rock, he poured molten zinc around it to hold it and then sent his drill down without a pipe. This was so that steam from all the crevices, fissures and holes, on the way down, might flow into the well and come up through the pipe.

The pressure became so great that when water was poured into the pipe to clean out the well an explosion followed that shook the mountain side. Rocks weighing fifteen pounds were hurled 300 feet. The pipe was blown out of the ground. A column of water 500 feet high was hurled into the air.

When the well ceased spouting, Grant and his drillers surveyed the spectacle, partly in sorrow, partly in solemn glory. The well was a wreck. All of the money invested in it was gone. The ground and trees for hundreds of feet around were covered with bluish mud.

Grant dug up some more of his own money, borrowed some more and started to drill another well, using the same size pipe. Again, after going down a few feet, he found steam. The farther he went, the greater became the pressure. And the greater the heat at the bottom. It finally became so hot that lead let down with the drill melted. Lead melts at a temperature of 620 degrees. At the top the temperature was about 350 degrees. That means superheated steam.

Grant sank his first successful well 203 feet when the pressure became so great that he could not well go farther. He put a cap on the end of the pipe and screwed in a steam gauge. The thing registered 68 pounds. With the cap off and the steam blowing freely, the pressure was 20½ pounds.

By this time, Grant was not so crazy. Neighbors began to think better of him. His banker no longer treated him as if he were a nut. Instead, he saluted him as a man of imagination and genius. Grant was therefore able to form a little company to drill another well. He had to form a company because he had put about $75,000 into his work, up to this time, and had little left. By talking as hard as he had drilled he was able to sell enough stock to drill another well, 50 feet from the one that was already spouting. He attached a 20-horsepower engine to the first well to drill the second. This was the first engine on the American continent that was ever run by steam taken from the earth.

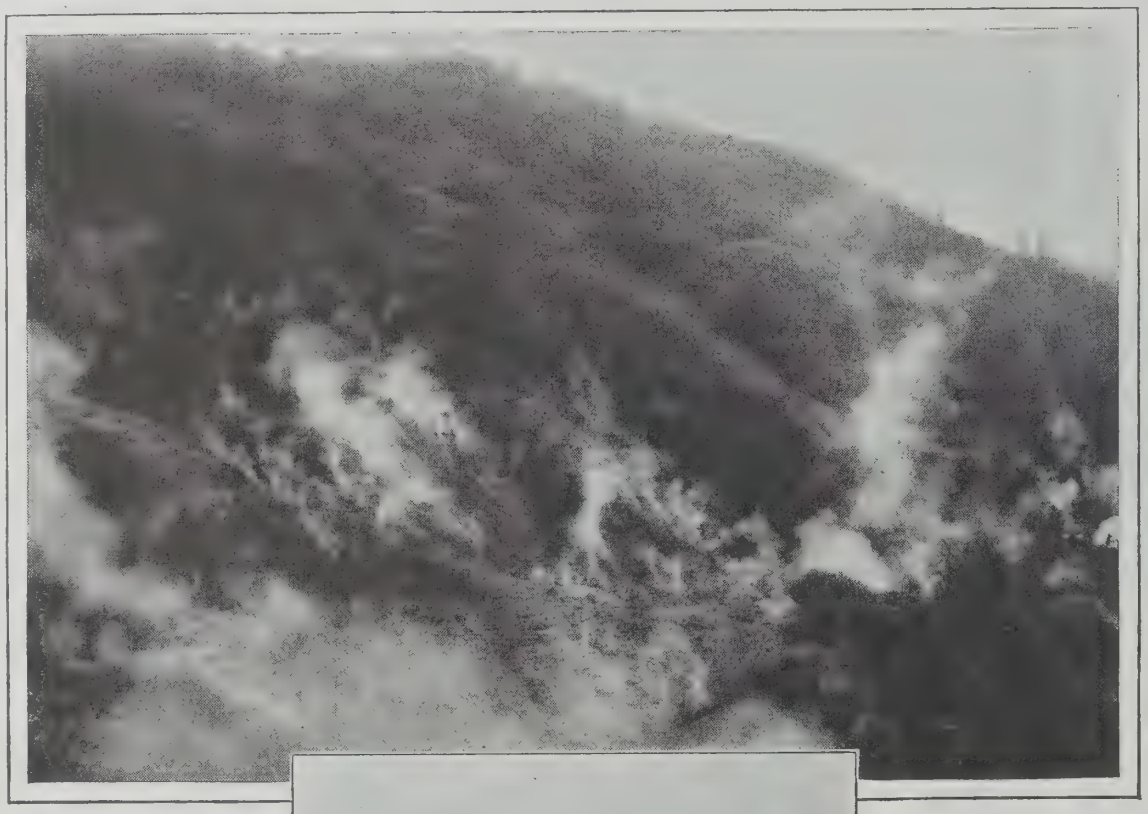
Grant used a little larger pipe on what was destined to be his second successful well—eight inches, inside measurement. At a depth of 319 feet he had the same steam pressure that he had in his first—68 pounds. There he stopped.

About this time, the big power companies of California began to take notice that Grant was doing something. Grant also began to take notice that somebody was doing something to him. He found himself tied up in litigation. Some of his own stockholders had taken him into court. They sought to prevent him from selling more stock with which to drill a third well. It did not seem as if the thing could be brought to a focus. But last summer, Grant got things straightened out and proceeded with his third well. In September it was down 137 feet and had a pressure of 30 pounds closed and 13 pounds open.

All of this Grant told me as we sat in a little hotel in Healdsburg. But he wanted me to see the wells and I wanted to see them. The only way to do it was to motor to them over a mountain road 25 miles long.

This was *some* ride. That the reader may lose none of the thrills, let us take the points of the compass and see where we are.

Healdsburg is 68 miles north of San Francisco and about 25 miles inland.



Above—Geyser with steam from the big boiler in the earth issuing from a thousand fissures.

Almost a quarter of a million dollars' worth of power going to waste from these two wells each year.

The steam wells are 25 miles northeast of Healdsburg.

We started from Healdsburg, which is a pretty little town that dates back to the gold rush of '49. The town itself suggests everything that the trip was destined to prove not to be. The town is on the level floor of a great valley with mountains in the distance on each side. In the center is a little park a big block square in which are orange and other trees. I have seen oranges lying on the ground in February that passing schoolboys would not trouble to pick up. Anybody, it would seem, could sleep in beautiful Healdsburg—though Grant couldn't.

Grant is a fast driver on level ground—but we did not long remain on level ground. We were soon on a rapidly rising plateau that eventually broke up into hills. The houses became farther apart and soon disappeared. What had been a maze of hills developed into fewer greater hills. As we proceeded the hills became mountains. We did one letter "S" after another to scale each peak. One could not go up straight. One had to zigzag back and forth to get up, even on second speed. And nowhere except at the top of a peak could one see the road for more than five rods ahead. It was a succession of right and left angle turns. Grant was constantly whirling the steering wheel first one way and then the other. It was no boy's job. Each turn had to be made quickly. In spinning the wheel around, many a time his elbow dug into my ribs. And when we were at the top of a peak, all we could see was a great valley and a higher peak which we must climb after going down into the valley. Going down was as bad as coming up because we might meet someone at any of many sharp turns who would knock us off the narrow road. Grant said to me once: "If we were to go off here we would drop straight down a thousand feet." I replied: "I would just as soon drop a thousand feet as fifty—the result would be the same."

"It is safe enough," continued Grant, "if we don't meet some fool coming around one of these corners at 20 miles an hour."

We were making the corners at five miles an hour and never went more than twelve.

"But those maniacs come through here at twenty sometimes," said Grant. "Three machines have gone over the grade right here."

I looked where he pointed and saw the wrecks.

"Around the next corner a woman was killed this summer," he went on.

I looked where he pointed, but the precipice was so high that I could make out nothing at the bottom.

"You see how the brush is all burned off the mountain side," said Grant. "Deer hunters did that. I never saw anything so cruel in my life. They burned off the brush so the deer would have no shelter and could be killed more easily. I was through here last month and it sounded as if a battle were going on. More than 150 deer were killed right here in this gulch. See, there is a camp by the roadside where some of the hunters stayed."

After 20 miles of this sort of thing, we slid down the last peak into Alexandria Valley. I heard a tremendous hissing that sounded like a dozen locomotives next door blowing off steam.

"What's that noise?" said I to Grant.

"It's the steam wells," he replied. "They are farther down the valley."

The automobile part of our journey ended at the Geysers Hotel, a wooden structure built in 1852—and it is not any better now than it was then. I was told that General Grant once stopped there. He may have

Concluded on page 14)

Mr. Ford's Page

THERE are pioneers, plodders and parasites. Pioneers make the venture and the conquest. Plodders consolidate and hold what has been gained. Parasites follow to live off others' labors. Each fulfills a purpose, even the parasite. He is pretty low down in the scale, like the maggot, but his presence is an advertisement that something exists on which he can live. It is likewise a warning that that "something," whatever it may be, should be eliminated.

But we cannot afford to view life from the maggot's or parasite's point of view, nor even justify them because they fulfill a scavenger's duty; as human beings we are bent upon securing a mode of life where these things simply die out for want of sustenance. Pioneers are far more interesting, and more worth emphasis.

Most of us would not have to go very far back into our families to find a pioneer. There may even be pioneers among our recent newcomers to America, although no longer does any doubt exist that the number and ratio of parasites have increased. Most of us are here today because some man and woman were brave enough to venture across strange seas and settle in strange lands to make life as they wanted it to be.

There is this about the pioneer: he is usually the man of most courage and vision in the community. Timid people stay at home. People who live in the rut do not venture afar. But the pioneer has the vision to see new regions and the spirit to conquer them. Pioneers by land pushed back the frontiers until there are no longer any frontiers. Pioneers by sea have charted the deep and marked every shore and island.

And because of that, because the country is settled and all the world is known, we incline to think that there is no more pioneering. And yet it is going on, right under our eyes, with a daring and a dash never before equaled. The pioneer spirit did not die with the disappearance of the last frontier nor with the discovery of the last Pole; it simply changed its field, and charged ahead with all its restless energy to new conquests.

Pioneering is based on the inquiring mind and the experimental courage. Serious experiment *is* a combination of natural desire and deliberate courage. It requires the pioneer type of mind. Our modern pioneering is not geographical, it deals less with the exterior of things than with their interior. Instead of sailing round the surface of the earth, our modern explorers are penetrating the deep and unknown mysteries contained in the substance of the earth. They sail on voyages more fraught with consequence to the race, than those of Columbus or Magellan.

There is another difference—the modern pioneer may see now and again a resting place, but he sees no end. You can push back land and sea frontiers until there are no more; but you cannot push back the frontiers of knowledge until there are no more. Mind boundaries may enlarge but they do not disappear.

The strange thing about knowledge is this: every new discovery but opens up wider regions to be conquered. The less a man knows, the less for him there is to be known. The more a man knows, the more there is for him to know. Wise men no longer measure learning by what they know, but by what their learning shows them they do not know. The Unknown is the only region that is increased, the only region that is not decreased, by discovery.

That is where the fallacy arises in the statement that knowledge does away with faith. It is quite the other way round: knowledge increases the field of faith, renders faith more necessary than before, makes it a greater and more creative force.

And this increase of the Unknown along with the increase of the Known, indicates the infinity of life. When with every accomplishment the field of possible accomplishment becomes larger instead of smaller, we get the idea of the endlessness of life's purpose and the vastness of its possible progress. Man has a long and interesting job before him, not to be measured by space or time.

Yet we often hear people talk as if all the pioneering were done. There seem to be folk who actually think that the world has reached the limit. It is perhaps impossible to change old encrusted minds, but every young person, and every person who wants to keep on growing, and keep a mind as young as the newest truth, should strictly maintain the thought that the world has hardly begun. What we call the marvels of the present age are marvels only because we are such children, such new beginners in the art and mystery of life. They will become commoner than daily bread. Within half a short lifetime the world has been changed, the miraculous of a quarter of a century ago is now the plaything of boys.

A TYPE of mind seems to believe that because all the earth is known and the country settled, therefore no further pioneering remains to be done. Thus far the pioneers have been working on the outside of things; nowadays the new direction of pioneering is toward the inside of things. We know the planet pretty well; we are now exploring the atom. We know vegetation pretty well; we are now pioneering into the new and wonderful land of vitamins. Medicine has explored disease to a large extent; it is now pioneering into the greater mystery of health. We are only in the far-off dim beginnings of knowledge. Discoveries are yet to be made, greater than those of Columbus—but in another region. The youth of today live in a more thrilling period than those of the merchant adventurers or the early frontiersmen.

Someone once said—he was a learned man—that he felt, after all his successful quest for knowledge, that he was but a child playing with sand on the seashore. The saying was much quoted to illustrate the humility of the great. As a matter of fact we have not even begun to play with the sand of the seashore. We have just begun to notice that it is there. Humanity is in the dim beginnings of that process of "taking notice," as we see babies do. The sand!—why, the pioneers sought for distant shores; the pioneers of today are trying to get inside the grain of sand that makes the shore, and inside the atom, and when that is accomplished and we begin really to play with the sands on the seashore, it will be a new earth. No, we haven't begun to play with the sand yet; the smallest unit the mind can think of has become for science a vast universe of mystery.

So that there is plenty of pioneering to be done. It is one of the unnoted marvels that life goes on as well as it does, because no sooner does one get inside the mind of a master in any field than one discovers that the principal thing about that master is his sense of the impossibility of mastering his field, and the imperfection of such knowledge as passes for mastery with the throngs. More interesting books could be written on the things we don't know than on what we know, because there are more of the former than we can catalog than there are of the latter.

If any young person thinks the field is full and all the chances taken, all the great adventures fulfilled, and all the pioneer opportunities exhausted, let him make excursions into various fields of endeavor and see how far his thought is from the fact. Go to the doctor: is the field of medicine conquered? No. A great medical school recently sent out a communication in which were stated some of the things that medicine does not know. Very simple things they seem, too, but they are great open fields for pioneering.

Go to the clergyman: is the field of the soul fully covered? Is the mystery of man's inner life clearly known? This stream that flows in upon man, that would save him from his follies and redeem him to new opportunity, what is it? Of course, the province of Religion is to remind us that it *is*: but just *how* it is, we do not know. Here is a vast field for the spiritual pioneer.

In finance—will any financier tell you that our system is perfect or even good? No. He will probably tell you it is all we have, and that he can see no better one in sight. Here is a call for pioneers. Economics, chemistry, diet, soil, water, air, children, learning, loving, working—these are commonplaces, yet every one of them represents a boundless field, an unfathomed mystery and a strong call for pioneers.

And yet people sit by and mourn that all the doors are shut and all the interesting things have been done!

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Exactly What Did Occur?

IF WASHINGTON would make a statement on the foreign debt situation which in any way met the serious and circumstantial charges which are being made here and abroad, the air would clear much more quickly. It has been reported in this country that when the time came to sign the agreement of the Allies with regard to the distribution of reparation and occupation-troops payments, the American representative, Ambassador Kellogg, notified the conferees that he would sign with the reservation that the Washington Government was bound only insofar as the rights of the United States were concerned.

It is further reported that immediate protest was made by the assembled statesmen—Churchill the British Chancellor, Clemental the French Financial Minister, Theunis the Belgian Premier, Stefani the Finance Minister of Italy, all of whom protested that the conference had gone forward on the assumption that the United States would sign the whole agreement and back the whole agreement. They protested that the United States could not expect to collect, and avoid all responsibility. Then, say the correspondents, "Ambassador Kellogg withdrew his reservations and, together with Ambassador Herrick and Colonel James A. Logan, signed the whole agreement."

The result in Europe was exultation. The United States had been roped in at last. Its signature was with the rest. If America had been denounced as "materialist" and "money-grubbing" before, European comment now clearly showed that Europe's materialism and love of money was abysmal: the most vulgar terms were used by statesmen and press alike to express their joy that America's signature had been bought for so small a sum and so insignificant a percentage.

Upon all this European acclaim, American editors and statesmen protested, notably Colonel Harvey among editors and various Senators. Then came the statement of the Secretary of State that "the agreement at Paris neither surrenders nor modifies any treaty right of the United States."

What the State Department should do, in matters like this, and what it has not done heretofore, is to give precisely stated assurance that it is not the policy of the United States to turn itself into a collection agency or use military power to enforce financial deals, and, in relation to the present matter, give exact explanation of what occurred at Paris.

Did the American representative tell the agents of the other powers that he could not sign the agreement as a whole, and did he afterward sign it as a whole?

Either Europe is misled or we are misled. And in these matters it is indicative of callow inexperience to leave any loophole for such serious misunderstanding as has arisen.

Aaron Spouts Again

MR. AARON SAPIRO has been putting it over on some of the farmers so long that he found it comparatively easy to put it over on the newspapers. Through the activities of his press agent, all the news associations of the country have carried the news that Aaron has "sued" THE DEARBORN INDEPENDENT. For weeks before that, the newspapers dutifully and almost daily carried the statement that Aaron had "demanded a retraction" of this paper. Wherever Aaron would make that statement, there the press would pick it up and broadcast it—with no care, apparently, to learn the truth of the statement, or to guard against imposition.

The fact is that during all those weeks Sapiro had not made a demand for a retraction, and the fact is that at this writing Sapiro has not sued—at least no word of it has reached this office.

There has been received at this office a Sapiro stump-speech of 37 pages, bearing all the Sapiro characteristics of bombast and inaccuracy. He has not made the only answer that can be made—a very simple answer too; and when he attempts to wrestle with concrete statements it turns out, surprisingly enough, that the statements about which he grows most verbose are those that were never made. And yet it is almost certain that the man can read.

THE DEARBORN INDEPENDENT desires frankly to say that as its search is for the truth and that alone, it would have no hesitation in setting right any matter which Mr. Sapiro might show it to have overlooked or misstated, but as this has not been shown by Mr. Sapiro, the matters to be retracted as untrue are not yet defined.

It is quite probable that Mr. Sapiro will enter suit. He has a habit of doing that. When in the past he has been hard pressed on the facts and his friends have been anxious about his inability or disinclination to reply, except by vituperation, he has successfully though temporarily quieted them by saying, "I will sue them!" And he has brought suit—but none of the libel suits have been heard! It is to be hoped that at least in one case, if he chooses the courts as the battleground of his special co-operative idea, he will go through with the matter, and enable trained men to expose his system item by item to the steady gaze of the farmers of the land so that they may make their own verdict about the plan which he is recommending to them. The matter of libel, and what Mr. Sapiro very erroneously alleges to be the personal difference between him and this paper, can take its chance in the courts.

The main thing is to get this Sapiro system of co-operation presented to the farmers of the United States more fully and more fairly than it is presented in Mr. Sapiro's magnetic oratory on the stump. Mr. Sapiro has been selling himself. Our interest is in his system. In a court of law that system can be turned, even to its inmost corners, to the bright light of competent and impartial scrutiny.

Airships and Seaships

THE controversy as to the respective merits of airplanes and warships seems to have lost its basic balance on facts. As well discuss whether a fish or a bird is the most useful to mankind. The warship is on the sea, the airship is in the air. The one cannot fly, the other cannot support and carry thousands of tons of guns and ammunition. They may co-operate, but to talk of one displacing the other seems altogether futile.

It is altogether speculative to speak in definite terms of what a bombing plane can do or can not do to a warship in the course of a duel. There has been no real test of this, and therefore opinion is largely hypothetical. And all the elements, even of speculation, are not present until it is also discussed what a warship could do to a flock of airplanes.

The whole emphasis of the general discussion has been upon the possibility of replacing warships, before it has even been settled that the air above the sea is an airship's best field of activity. That is a crucial point: and it cannot be merely assumed; yet no one seems to be questioning this constant comparison of airships and sea-power. Why not a contrast between airships and land armies?

But one thing is certain in regard to these squadrons of the clouds. They will be great factors in fighting on land. It is on land that the fate of future armies will be decided. And the decision will undoubtedly be made by the men in the air. This is a fact which seems to have been lost sight of in the controversy which has arisen between warships and airships.

This country has developed types of aircraft, both combative and commercial, which cannot be surpassed by any other nation, and there is no lack of expert pilots, or material out of which to make such, to man them. This has been fully demonstrated by our airmen in various parts of the country. What we lack is not mechanical and engineering designs and pilot skill—what we lack is airplanes. This country has far too few. In fact, compared with other great nations their numbers are negligible. In all fairness to commerce and defense, this should not be.

The eagle is our symbol. But the eagle must be given wings.

The Work of the Ministry

IN A recent conference at Yale the fact was emphasized that the uses and service of the ministry go beyond preaching and teaching. Dr. Richard Cabot, the distinguished medical authority at Harvard whose writings have done so much to humanize the popular conception of medicine, and whose work has done so much to humanize the treatment of the unfortunate, is of the opinion that ministers of religion might well do much of the work that is now left to physicians. He is of the opinion that the majority of sick people need mental and spiritual treatment more than they need medication. He thinks that institutions for dependents and mental incompetents might well be placed under the control of trained clergymen. Alms houses, jails, infirmaries, asylums, he regards as legitimate calls for a larger exercise of the ministry than has yet been undertaken.

Of course, this is all true enough—tritely true, in fact. But it raises problems. The "social service" development which has become so rampantly professional as to be practically certain of sudden diminution at an early date, would doubtless endeavor, if anything along the line of Dr. Cabot's suggestion were presently undertaken, to make the spiritual ministry an auxiliary to "social service" as modernly conceived by the professionals. It may be considered as finally settled that as "social service" itself in its best development is the daughter of religion, this further service of the ministry to distressed humanity will come, not through "social service" channels, but through the same channels as social service itself came.

Another problem is the ministry's efficiency in the use of spiritual forces, which again cannot be had from the professionals, but which is the by-product of a saintly life and a sanctified intelligence. The distressed need, says Dr. Cabot, spiritual and mental help more than they need medication. To be sure! But medicine may be administered with some certainty as to its fitness and effect, and how often may that be said of spiritual medicine? There have been great practitioners of spiritual medicine in the ministry, it is true, but they came of no special system. Can true Spiritual medicine be taught? Has it been systematized as yet? Where is the spiritual diagnosis, the sure use of truth as catharsis, balm, stimulant, tonic and life?

The hope of this good service arriving among us would seem to be in the ministry and its source. The field is to be occupied by those who can. One man actually working in this field, wherever he finds it, is doing more for the expansion of ministerial service than most conferences do. Many men are thus actually working, but have not dared to name their work so high as here. That is to say, it is open everywhere for ministers who believe what their position indicates, to begin at once as practitioners of higher medicine, not as physicians of the body, but as the cure of souls. The very beginnings of the practice will send them quickly to the sources.

The Universal Parasite

"THE usurer's business is as menacing to the well-being of the State as the dope traffic—and it is organized on an equally extensive scale. There is not a section of society from which the money-lenders are not drawing toll. By their exactions they drive men and women to crime and even to death."

The London *Daily Mail* thus gives expression to an opinion based on special inquiries it has made regarding an evil which is not confined to any particular country but to the world at large. It is pointed out that there is one point about money-lending which emphasizes its similarity to the dope traffic: it is largely in the hands of aliens, many of whom have become naturalized and have adopted English names.

When it is considered how strong a fight was put up against the system of interest and usury by all the moral forces of the Anglo-Saxon world more than three centuries ago—that the whole system was resisted as a poisonous and destructive invasion—there is no doubt but that our fathers foresaw the entrenched evils which are now becoming terrifyingly manifest. The essential immorality and anti-social power of usury is beginning to force itself upon the consciousness even of the financiers.

The blight of usury is perhaps the greatest evil that the world suffers from today. It is the universal parasite.

Shall We Continue to Centralize Matters in Washington?

(C) Harris & Ewing

SENATOR LEE S. OVERMAN.

"Were we directed from Washington when to sow, and when to reap, we should soon want bread." —*Thomas Jefferson.*

By LEE S. OVERMAN
JUNIOR SENATOR FROM NORTH CAROLINA

THE last general election was won without regard to issues, but solely upon what the people believed to be the qualifications of one man.

Early in the campaign, Republican politicians realized that they could not hope to go before the people on a Republican record. Hence, the cry arose—"Coolidge is the issue." No other claim must be made, and none other was.

There can be no mistake that a great majority of the nation gave Mr. Coolidge a most solemn mandate. In the minds of the voters, he was divorced from his party to begin with. It was Coolidge that was returned to the Presidency; there was no mandate to the Republican politicians. Therefore, Mr. Coolidge's responsibility is exceedingly great.

The Parlor "Pinks"

BUT the recent election demonstrated another matter of vital national importance, and that is, the lack of confidence the people expressed in political parties as such.

Why this lessening of respect for the old-line parties? The situation indicates that there must be a need of house cleaning within party ranks. It indicates further arties have been drifting away from fundamental ples that have always captured the affection of the masses.

I shall not attempt to say much in this article about the Republican party, but will point out briefly just a few things that I believe we Democrats could ponder over with a great deal of profit to ourselves.

In the first place, the Democratic party should firmly resolve that its age-long policy of thorough Americanism should be strictly adhered to. It should take a thorough stock of itself and stand against the siren calls of the parlor "pinks"—be they masculine or feminine—that have been so perniciously active in the United States for the last few years.

Let there be no confusion about this statement. There is ample room in the Democratic party for wholesome, progressive, American ideas. The progressive legislation passed during the first Wilson Administration fully evidenced the fact that the Democratic party is a progressive party—progressive in the sense that it responds to the will and needs of the American people in a sane and judicious manner. There is a great deal of difference between such a policy and being captivated (or browbeaten) into support of measures that have originated under influences entirely un-American, measures that are not only unsuited to American needs but are fraught with great danger.

More Government at Home

LET me illustrate by briefly referring to the proposed amendment to the Constitution known as the Child Labor Amendment. This amendment proposes "to limit, regulate or prohibit the labor of all persons under eighteen years of age." At present this power resides in the respective states and this amendment undertakes to transfer such power to the Federal Government. It will be noted that, in reality, *this amendment is not a child labor amendment,* but might more properly be called *a "child control"* amendment. It is most general in its scope and is probably the greatest grant of power that has ever been proposed for any general government in the same number of words.

It does not attempt to regulate the employers of children under eighteen years of age, the conditions under which they shall work, but it seeks, rather, to control the child and any manner of work in which he might become engaged, whether with or without compensation.

There is convincing evidence that this idea originated in Russia during the Bolshevik régime and has been transplanted in America. Congress seemed to handle the matter rather gingerly and evidently thought it must pass some such measure before the election, and, therefore, "passed the buck" to the states. It is fervently to be hoped that the respective legislatures will fully understand the import of this proposition before they come to a vote on it. But to begin with, legislators will have to make up their minds to steel their hearts against wily propaganda and clever lobbying. No stone will be left unturned to force this monstrosity upon the American people.

Such legislation as this can well be left to the several states. North Carolina has already refused to ratify. North Carolina also boasts of an excellent child labor law and it had my support in its passage and I take pride in its enforcement.

But here is where the Democratic party comes in:

The Democratic party was born the champion of States' Rights. We have had periods in our history when we have wandered away, and we occasionally have cause to think over "a frequent recurrence to fundamental principles."

One of the greatest causes of unsatisfactory conditions in the United States is the fact that we have wandered away from the principles of States' Rights. We should get the idea into our minds that we need *a little more government at home and a little less in Washington.* Thomas Jefferson never uttered a truer saying than that

> "It is not by the consolidation, or concentration of powers, but by their distribution, that good government is effected."

Concentration of power will inevitably result in abuse of that power to some extent.

Senator Overman has represented his state in the Senate of the United States since March 4, 1903. Prior to this he had served in his state legislature for a great many years and was a lawyer of outstanding ability. He is the ranking Democrat on the powerful Appropriations Committee of the Senate as well as of the important Judiciary Committee. It has frequently been said of Senator Overman that he looks more like a United States Senator than any man in the Senate.

There has been far too great a tendency to pass on to Washington disagreeable tasks and asking the general government to find the solution. We need some good old-fashioned home-grown Democracy in America today, the spirit that will move people to look around home a little and see if they cannot do some of their own governing.

There is no safe basis for judging just how far this concentration of power and government at Washington will go. Even now we are confronted with a proposition regarding education that will, if heeded by Congress, finally result in the nationalization of our public school system. If there is anyone who doubts that the respective states of this Union are sufficiently able to take care of the education of their children and provide adequate public school facilities, I invite such individual to visit my native state and there see the rapid progress North Carolina has made in her public school system within the last decade. Today the Old North State has a public school system of which any commonwealth could be proud. It is growing and improving, and we intend to be second to none in these great United States. And it is doubtful if we now are. But we would never have made the progress we have if we had depended on Washington.

Too Many Laws

NATIONALIZE! Centralize! These seem to be the slogans of individuals who do not understand what the fundamental American system is, and who would like to change our system after a foreign pattern. Why we fought the Revolution to escape a concentration of power unwisely used. Our forefathers were determined that they would make no such mistake in America. Power was to be wisely distributed and jealously guarded.

Harken again to Jefferson:

"Were not this great country already divided into States, that division must be made, that each might do for itself what concerns itself directly, and what it can so much better do than a distant authority."

And again:

"Were we directed from Washington when to sow, and when to reap, we should soon want bread."

Again:

"When all government, domestic and foreign, in little as in great things, shall be drawn to Washington as the center of all power, it will render powerless the checks provided of one government on another, and will become as venal and oppressive as the government from which we separated."

The tendency toward centralization at Washington was critically observed more than a century ago, but there has been little to halt the onward march.

But one thing will halt it—the American People; they alone can halt it. When they see their home affairs taken away from them one by one, and intrusted to the tender and distant mercies of bureaucratic administration, they are going to resurrect Democratic doctrine on this question, and adopt it. States' Rights is no longer a partisan nor a sectional but an American doctrine in which even Republicans have come to believe. Washington itself will be forced by the very burden which centralization imposes, to warn the people not to be misled in giving away their rights. Not every problem that faces the country can be met by the simple expediency of more Federal legislation.

We have too many laws now. We are confronted today with the necessity of farm relief legislation, an obligation that members of Congress cannot ignore. But, farm relief legislation becomes necessary today because so much of special privilege legislation has preceded it. If other interests, using special legislation inuring to their benefit, had not brought about the present economic situation, the farmer would not be facing a condition that requires legislation for his benefit!

The nation needs legislation to undo some of the legislation already enacted. The American people should have a fair chance to manage their own affairs. We should check the growing tendency of our government to pry into our most private affairs, to take over the operation of our homes, and to dictate the conduct of our families. Americans do not want too much governing, and once they get the proper channel through which to express their resentment of it, they will make it clearly and unmistakably known. The Democratic party should become the means for that expression.

North Carolina's Stand

WE NEED to return to some old-fashioned Democracy! which simply means in other words, "Back to the fundamental principles of the Constitution."

It will be remembered that my state was responsible for the Tenth Amendment to the Constitution, which reads:

"The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people."

North Carolina was unwilling to leave this important question to future interpretation, and, together with Rhode Island, refused to enter the Federal Government until November, 1789, nearly a year after its formation under the Constitution, and would not enter until this amendment was adopted. There were other states just as concerned over its incorporation, but entered the Federal Government upon assurance that it would be put in. However, North Carolina wanted it "written in the bond." Therefore, it may occasion no surprise if North Carolinians have firm convictions in regard to it today. The Old North State just as jealously favors the guarding of her rights today as she did in 1789.

University of Hawaii Justifying Itself

WITH hundreds of colleges and universities turning out their graduates by the thousands the present year, a thought should be given to the possession in the Pacific where the youngest and one of the most interesting institutions of learning on United States soil is the University of Hawaii, which graduated its first class in 1921.

Here has been laid the foundation for an educational movement of far-reaching importance. A field has been opened up which in its moral aspect may easily lead to a better appreciation of American idealism in the eyes of Orientals. The progress at the University of Hawaii within the short span of three years is a noteworthy contribution to the advance of education wherever American interests dominate.

This university grew out of a college created by an act of the Territorial Legislature in 1907. The college opened with temporary buildings in 1908, gave its first baccalaureate degrees in 1912 and the first honorary degrees in 1919. The act creating the University of Hawaii to take over the college was passed in that year and classes were started in 1920. It is located in the Manoa Valley, near Honolulu.

The composition of the student attendance is not the least interesting phase of this American university in Hawaii. The student body is fairly equally composed of descendants from at least five racial stocks—Anglo-Saxon, Chinese, Japanese, Korean and Spanish. Dr. K. C. Leebrick, Professor of History and Government, in discussing recently the position of the university as an element for progress, emphasized the Americanism of the students, their desire to become good citizens, and in this manner add their strength to the body politic of the nation of which they are a part.

"Christian General"—Saint or Sinner?

Feng Yu Hsiang as a Second Saul of Tarsus; Man Most in the Limelight in China Today

By MRS. L. M. CRAMER

THE man of the hour in China, the man most in the limelight here today, is not Marshal Lu, former head of the Chekiang forces in the inter-province war between Kiangsu and Chekiang, who deserted his troops and fled to Japan between two suns, nor is it General Chi, victor over Lu, heading the Kiangsu troops, though these two generals occupied the limelight some two months ago, even to the exclusion of Dr. Sun Yet Sen. Nor is it General Wu Pei-fu head of the Chihli party and dictator of its policies, the man who is more responsible than any other for having made Tsao Kun president of China, nor is it General Chang Tso-lin, war lord of Manchuria, who led his men in an attack against General Wu, his old enemy, and the man who conquered him a year ago last April when Chang was driven ignominiously from the walls of Pekin, a sad and disappointed man.

All these men have had their day in the limelight since this series of wars broke out last September, each fighting against the other, and each man, by his own declaration, fighting for the glory and unification of China.

A singing class of Feng's soldiers. Incidentally they are singing hymns from a Methodist hymn book.

Nor is the man most in the limelight General Tsao Kun, till forced to resign four weeks ago, the president of China, to which office he had been elected in October, 1923, at a cost to himself of something more than $20,000,000, it is said, and it is not the poor little boy emperor, Hsuan Tung, who now finds himself deprived of his ancestral palace, homeless and virtually a prisoner, though his story alone would make a thrilling plot to romance or play.

The man most in the limelight in China today is General Feng Yu Hsiang, who a short quarter of a century ago was a common soldier, and among those soldiers who helped to persecute the Christians in the Boxer Rebellion. Today this unique character among China's military men is known the world over as the "Christian General." But whether he is saint or sinner is today a moot question among men of his own race. There are those who stand by him, declaring that by deserting his chief, General Wu Pei-fu, and almost throwing him into the hands of his enemy, Chang Tso-lin, he has proved himself a courageous man, dealing the deathblow to militarism in China, and starting the country on its way toward peaceful unification. Feng himself says that. He says the warlike methods used by Generals Lu, Chi, Wu, and Chang for the unification of China have failed of their purpose, costing the country millions of dollars and hundreds of thousands of lives, accomplishing nothing.

But there are others who say that he is a traitor; that he betrayed his chief to the end that Chang Tso-lin might win and that Feng himself might profit both in position and in hard cash. As to that only Feng knows. But the fact remains that in the dead of the night before October 20, without notice to his superior officer, he marched his fifteen thousand men stealthily from the position they occupied as a unit of Wu's army and invaded Pekin, a stand Wu was fighting desperately to keep from Chang.

The next morning Pekin awoke to read proclamation after proclamation, to the effect that General Feng had taken over Pekin and would force President Tsao Kun to resign; that a warrant had been issued for the arrest of General Wu; that unification by force had been proved a failure and that he, General Feng, would unify China by peaceful measures. To this end he announced that he would call a round-table conference of the different war lords of China, the conference to be held in Pekin to discuss ways and means of bringing peace and light out of the chaos that is China. To this conference he said he should invite General Chang Tso-lin, General Lu (the man who deserted his troops in their direst need) and Dr. Sun Yet Sen; but Wu's name was never mentioned in that connection.

Then one day a week later General Feng issued a proclamation offering a reward of $100,000 for the capture of General Wu, and $50,000 to any one shooting him!

General Feng has, perhaps, the best drilled and the best disciplined army in China, and so when it was announced along last September that he was placing his army at the disposal of General Wu, who was about to defend himself against General Chang, everybody sat back and prepared to announce their allegiance to Wu, for it was thought inconceivable that Chang should win against Wu and Feng. It was a one-sided fray so everybody thought.

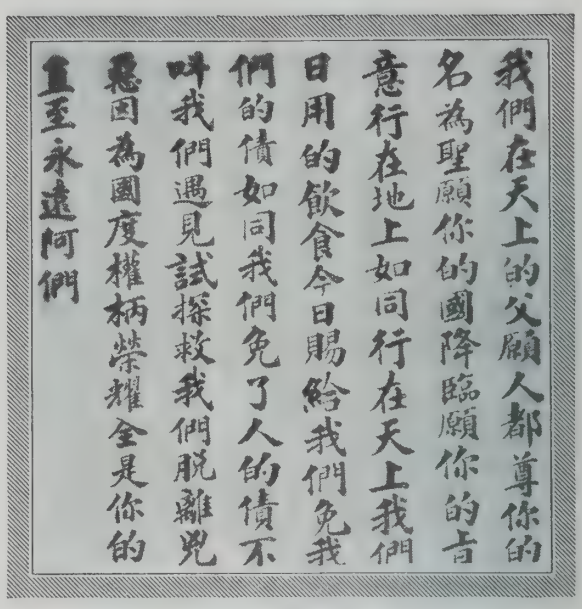
But soon it seemed not to be so one-sided. Little was heard about Feng's army except that it was allied with Wu, and General Wu seemed to be getting the worst of it in every battle fought. There were men at the very beginning who said there must be treachery somewhere. About this time there came news from the north, that General Lu, who had deserted his troops a short time before, and sought a haven in Japan, had joined Chang Tso-lin in Mukden, offering his services to the northern war lord. It seemed to be all over for Wu, except the lighted lanterns and the parade of the victors.

But Wu is game. Licked to a frazzle and dumfounded by his betrayal at the hands of Feng, Wu disappointed friend and foe alike by refusing defeat. True, he staggered a bit under the blow, but he got his second wind and when it came it was strong enough to announce that ten provinces, China's Yangstze River provinces, would unite with him in an expedition against General Feng. These provinces include conquered Chekiang, Hupeh, Shantung, Honan, Shanzi, Anhwei, Kiangsu, Charbar and Siuyuan. It is interesting to recall that once, in the spring of 1922, General Feng was tuchun and absolute autocrat of Honan. That he is no longer tuchun of that province, one of the largest in China, is due, it is said, to General Wu's influence which may possibly throw some light on Feng's betrayal of his chief.

An interesting side light on this situation is the fact that all the Yangstze tuchuns have a nominal allegiance with General Feng. They may disapprove of his actions in double-crossing General Wu Pei-fu, but there is a feeling among the foreigners in China that it is very doubtful if they would consent to send an army against him. They can't figure out what benefit it is going to be to them personally. It is thought that at best they can be depended upon to send a small "face-saving" force to help out Wu. Even if they did so, there is no assurance that they may not sidestep all responsibility to either general till they can determine what the final line-up is to be with the new power in Pekin, and what will develop in Manchuria.

According to reports of newspapers at that time, when the Chekiang-Kiangsu war broke out, General Feng offered to send reinforcements to General Chi. His hope, it was intimated, was that in case Chekiang was defeated, he himself might be made tuchun of Chekiang. His offer did not win the approval of either President Tsao Kun or General Wu Pei-fu, and this, according to some observers, is the reason for Feng's betrayal of Wu.

But after being turned down early in September, in his proposition to fight under General Chi, for Kiangsu, later, when Wu found himself made the defendant in a war on Pekin, and the Chihli government, Feng seemed to turn the other cheek, and offered his co-operation to Wu in subjugating Chang Tso-lin. His proffer was accepted gratefully this time. Being recognized as a Christian his promise was expected to be kept, and he was intrusted with the important duty of defending Jehol.



我們在天上的父願人都尊你的
名為聖願你的國降臨願你的旨
意行在地上如同行在天上我們
日用的飲食今日賜給我們免我
們的債如同我們免了人的債不
叫我們遇見試探救我們脫離兇
惡因為國度權柄榮耀全是你的
直至永遠阿們

The Lord's Prayer in the Chinese language.

When fighting in Shanhaikwan meant life or death for Wu, General Feng to the surprise of both foreigners and Chinese alike, changed his mind, and instead of fighting with Wu, his men shoulder to shoulder with Wu's men, and against Chang Tso-lin, he turned coat, declared war against his coworkers and Wu, "captured" Pekin, and issued a warrant for the arrest of Wu (which on advice of other high Chinese has since been rescinded) and, all in all, took over things with a high hand.

General Feng compelled Tsao Kun to resign, but not before he had forced him to take from General Wu whatever honors had been Wu's at the president's hand since he had bought his way into office a year before. He compelled Tsao Kun's resignation, and his flight from Pekin, and yet but a year before he was one of Tsao Kun's chief supporters.

It is not yet clear what the relations are to be between the Christian general and the war lord of Manchuria. Chang and Feng have been forced together by the accident of Feng's desertion of Wu, but whether they will continue to cleave together is not possible to say. There are those well informed in Chinese politics who declare that so long as each can use the other, there will be peace between them, but when the time comes when neither has an imperative need of the other, then there will be another war, unless a miracle happens. There are those, too, who think they see still further into the future; they see Feng and Wu again reunited against a common foe, Chang Tso-lin.

General Feng is professedly a Christian, but even the missionaries have been disheartened by some of the things he has done within the past few weeks. His treatment of his chief was unchristian. His manner of ousting President Tsao Kun and his cabinet and his parliament was too high-handed to be Christian; but, above all, what they cannot reconcile was his ousting of the boy emperor, Hsuan Tung, beloved of old China, who in his little purple city—which is the Forbidden City of China—has ruled an imaginary kingdom from an imaginary throne, and ruled it well.

Feng has used this "spirit wall" as a place to put his poster-sermon on the value of saving time. In China time has no value to the average native.

The House of Manchus was forced to turn over all its real estate to the new government, retaining only its personal effects. The decree of Feng to vacate the Imperial Palace instanter (less than one day's notice was given, in fact) was accepted without protest and carried out without a whimper though it entailed hardship. The boy emperor was virtually made a prisoner, and even denied the company of his American tutor, Mr. Johnson. Just why this last indignity was inflicted has never been explained.

But the boy emperor and his empress bride were both game, Hsuan Tung even declaring that perhaps this might result in his being allowed to travel, a thing for which he most devoutly hopes. No harm so far has befallen the young man, and Chinese and foreigner alike are hoping that none will. He has been given a place of residence in Pekin, but to this date is not allowed to leave the grounds, so he is really a prisoner in a sense, though not under arrest, and suffering no further indignities.

As to General Feng and his model army. Whether or not General Feng is sincere in his profession of Christianity does not alter the fact that his army of some 15,000 men is the model army of China. He is reported to go into battle inspired by biblical teachings,

(*Concluded on page 14*)

With Fashion Scouts on the Trail

Hunting for New Ideas to Standardize Things That Women Wear

By JEAN MOWAT

This is the concluding portion of the article on modes which appeared last week.

I REMEMBER once, on my way home from the Coast, glancing up from my place in the dining-car to see the steward seating a smartly dressed couple opposite me and hearing a familiar voice drawl: "Well, of all things. What are *you* doing on this train?" Looking up, I met the smile and twinkling eyes of a New York designer and her partner.

"Where have *you* been?" I asked in surprise.

"Just traveling around. Any number of good-looking suits and dresses on the Coast. I think suits are due for a revival in a new form. I would like to know where you have been."

"Traveling around; to the Klondike and a few points in Alaska."

"I heard in Seattle," said the designer, leaning across the table in a confidential attitude, "that Alaskan women could show many of the Easterners how to wear clothes, and that they are smartly dressed. Did you see anything good—anything we could use?"

"I thought you had gone abroad early in the season," I parried.

"I did," she replied, "one has to for the prestige it gives. Usually I can make these trips to the Coast without being recognized in a business way; this is the most fertile ground for fashion ideas I know about. You get a dash and color idea that is vastly different from that suggested by European models."

It would seem that in a section of the United States separated by 1,000 miles of water from the mainland it would be difficult to keep up with all fashions, but East Coast Alaskan women find it an easy and interesting task. The women who care for their appearance are never out of style, and how well they know it! It is certainly not true that all Alaskan women dress out of the missionary barrel; neither do the Indians, for the squaws order their own apparel and that of the family from the mail-order house.

Correct From Shoes to Hats

A MERCHANT in one of the East Coast Alaskan cities said: "Tourists coming here are inventoried from shoes to hats. Old clothes are 'spotted' because our women know what styles are being worn." I had taken this remark with a grain of salt but the truth of his statement was soon proved. A woman who had been bragging about wearing only old clothes while traveling ("one saved so much by doing this," she had informed us) passed by on the other side of the street. Two of the townswomen who had been discussing club affairs, looked at each other and one remarked:

"What I cannot understand is why these people come up here and wear old clothes. They must have money or they could not afford the trip. Do you suppose they think we don't know anything about style?"

Women in Alaska are carefully dressed from shoes to hats. Seattle sells quantities of low shoes and chiffon hose to Alaskan stores of the East Coast. When we heard this in Portland we considered it more or less of a joke. But well-dressed women were wearing these in medium colors. We were told that silk hose were worn with low shoes except in midwinter.

These women are not interested in foreign merchandise, as such. The imprint of the United States is liked on the apparel and the house furnishings, while apparel designed and made on the Pacific Coast is the leading seller. Alaskan women are most patriotic and to them Paris is not the seat of fashion, unless the decree just happens to suit them. "Give us American clothes," they chorus, and here it is that Los Angeles scores heavily. There is, of course, apparel from New York, for at least once a year a trip is made to the metropolis and a weekly service is maintained by some stores, so that the New York-made merchandise has its own chance in this vast territory.

America is as efficient in her program of fashions as she is in any of her industries. One of the first and an exceedingly important organization in the American fashion scheme is the one devoted to color. Along about the time of the war there were more shades than one could name. As an example, there were sixty-three shades of blue all known as navy. No wonder a day's shopping exhausted any woman, especially if she were trying to match navy blue! The same lack of system ran all through the color charts that were put out. War and its need for conservation did wonderful things for the American fashion industry.

A group of New York manufacturers got together and selected a few staple shades and these formed the nucleus of the present standard color card. Each season this association, now operating as a corporation, adds accepted and popular colors to the standard card and in addition issues two color charts a year—spring and autumn.

The organization has built up the color scale so that when a buyer in San Francisco wires a Milwaukee hosiery mill for a case of purple hose he does not just wire "purple." His idea and the mill's may be a mile apart, but he wires for one case chiffon, S7007 and that is the purple he receives. Through this standardization there is only *one* navy blue. But there is a cold blue and a warm blue and the difference between these is sufficient to mar any frock unless one knows which is which. Under the present system each color has a number and a name. The number indicates the relatively component color parts and the nomenclature has been chosen from agriculture, horticulture or geology as far as possible.

A definite scheme has been followed in naming these shades. The number is the key to the *exact* shade, planned for the convenience of the buyer, but the name is descriptive, meant to stimulate the imagination and desire of the customer, and, coincidentally, serve as aid to the advertiser in describing the goods. Take the color "whirlpool" (a deep water-blue with green undertones); one can readily see this color and the reason for grouping it in the range of blues. From geology is "feldspar," a light, rich green, slightly yellow in tone and on the order of jade. From agriculture comes the color "harvest" exactly the shade of ripened wheat fields.

An idea of the season's color card is shown in the eighty-eight colors, including woolens, shoe and hosiery as well as silk, meaning that anything can be matched. As a direct result of the recent Egyptian vogue there are shown two tapestry colors distinguished as "burnished gold" and "antique bronze."

Prominent are the reproductions of the Chinese colors, such as imperial yellows, glistening jade greens, antique lacquer, and sumptuous, exotic blues of the Ming and Ch'ling dynasties. Through a booklet the association announces the standardization of a yellow called "jasmine" and a light beige shade called "flax" for the cotton industry.

Throughout the country there are women who, all unknown to themselves, are fashion "tasters." If a manufacturer has an idea in a sweater, in an undergarment or anything having to do with the wearing of garments, he tries it out on his family, his friends, and his friends' friends, and they tell him just what they think about it, either wearing it or discarding it almost at once and registering frankly outspoken objections.

One firm had more than a thousand women wearing a new style undergarment for a season before it was felt that all criticism had been received and changes in the garment made satisfactorily. The first season this was placed on the market, and in the hands of the retail merchants, more than 2,000,000 suits were sold. There was a more or less local advertising campaign carried on to the merchants but they did only the normal amount of advertising for the undergarment section. "The biggest aid in this sale," said one of the makers to me, "was the favorable comment of the women."

Word-of-mouth advertising is one of the greatest advantages in the fashion business. One eastern firm spent more than $100,000 to try and secure this to create interest in a new knitted sports fabric, but failed to awaken a response. As a result it was about ready to call the sheriff and go into the hands of a receiver. A "Fashion Scout" of an eastern publication spending a holiday in the city was told the story and it so aroused her curiosity to see this new material that she called upon the mill owners and told them who she was, offering to aid them if possible through the fashion mediums at her disposal.

Putting an Idea Across

SHE made a trip through the mill and was told by one of the owners that during the war this factory had done a remarkable business on puttees, due, it was said, to an accident that made the fabric non-stretchable. This accident was one occasion when anger solved a problem that had puzzled wise heads. The foreman had spoken sharply to an operator about some minor neglect of her machine and for answer she jammed it, resulting in a clicking, a mixing of needles and then after a moment's hesitancy the machine began operating again—but it was a different weave.

This meant little in the life of the operator but a few hours after an examiner making the usual rounds noticed a different effect, studied it, stretched it—without success—and hurriedly reported to the office. This appeared to solve the problem which had been causing such dissatisfaction and when other machines were similarly set the same knitted construction was produced. The war stopped. The stockroom was filled with khaki-colored rolls of unused and uncut material. Then came the depression. In an effort to stimulate business it was decided to offer this material to retail fabric buyers. It was dyed in sports colors and salesmen went calling on the trade.

"We've a wonderful cloth but it won't sell," said the millman to the Fashion Scout. We have something better than was ever woven in America, but *how* can we inform the women of it? We have advertised in the best women's magazines and never received anything but bills from them. I always thought that women jumped at new things."

"They do," asserted the Fashion Scout, "but you must show them what you have, how it can be used and, of course, how they can benefit by it. Why not have some of this made up and show the women how well it looks and how very effective it can be for all outdoor wear?"

"That's a good thought. Why didn't we think of it?" mused the owner, "but who would make up this fabric in a way, big enough, so that we could put the idea across?" The Fashion Scout's answer was crystallized into action. For, a few weeks later, this fabric, made into sports frocks, suits, coats and capes, was shown at a Chicago fashion exposition noted for sponsoring new ideas. That the correct method of getting this goods before the public had been found was evidenced by the deluge of mail orders to the firm. Every fashion editor and reporter wanted to know about it, wanted a sample of the new fabric—as did those who had seen the exhibition. Trade publications discussed the new "find" in America as a solution of the problem of a suitable construction for outdoor fabrics.

Paris, never missing an opportunity to add to her fame, was interested, so were New York buyers, for only the hinterland buyers had been called upon by the firm's men, although the fact that this new fabric had been launched outside of the "fashion" city of America was not creating the most favorable comment.

"Yes, I saw it," confided a leading New York manufacturer, "but I didn't think much of it. Of course, how could one tell that the women would take to it like a duck to water!" and he shrugged his shoulders. "Well, I may not be first, but I will make some coats." Another season rolled by and from Paris came the new fabric made into modes for the promenade hour and a New York house featured this exclusively for the season. Then came the advertising by the women, as heard at the women's clubs, the ladies' aid and the bridge and mah-jongg clubs and today there is not a city of any size which does not offer this material in suits, coats and dresses for sports wear.

Some of the best of the recent ideas in the fashion world were bred of war-time necessity, always a spur to imagination and thought. Thus it was that when the makers of men's fine felt for hats were struck by the men joining the buyer's strike they found a profitable way out. The story has as many variations as there are important hat houses, each millinery jobber asserting that it was *his* house which presented to women the idea of fine felt hats. When father wouldn't buy the new hats were offered to mother and daughter. This fashion came the route of the most exclusive trade with prices that made the fine men's hat trade seem merely pikers. The woman paid $10 for the felt in the hat but an additional $25 was charged for the fashion idea.

Felt hats for women immediately became popular and today are recognized as a staple sports item presented in the smartest colorings, shapes and trimmings. Strange to say, while the idea originated in the eastern hat houses the smartest interpretation of the style has been developed on the Pacific Coast.

Another instance of business sagacity was evolved by one of the leading manufacturers of men's clothing, a house with a reputation for smartly tailored ready-to-wear garments, when it brought out a tailored coat for American women—due to an overstocked condition when war abruptly stopped. Now no firm, regardless of its size or past profits, wants to write a loss on such merchandise. These fabrics had been carefully chosen and were well ahead of the mass demand.

One fine day in June, a few years ago, the textile centers, manufacturers of garments and retailers were amazed to read an announcement stating that this firm would open its autumn line of *women's* coats the following day, although for thirty years it had been building up its reputation for fine men's apparel. This news caused a buzzing from coast to coast and among the local makers of clothes in that market there was much discussion and more or less "stove-talk" in the clubs at noon.

Predictions of failure were heard on every side but the line opened. Only accredited fashion-trade press representatives were admitted to the informal showing on living manikins. While this display was on, the press was casually informed that several thousand coats had already been sold on the Pacific Coast. "Gave the idea a thorough tryout," said one of the sales' executives, "and found a ready response on the part of the women. Now that so many women are driving their own cars the fabrics on the market are all too light to stand up under that strain. We have tried to provide for that as well as incorporate style and fine tailoring."

So encouraging was the reception accorded the idea that it has been adopted as a permanent feature of the house. The necessity of averting a heavy fabric loss has developed into a well-paying business and the tail of the dog has certainly grown to amazing proportions, and can wag some on its own account.

In the meantime, the makers who talked of early failure have followed, just as fast as they could, in the same footprints. Contrary to every prediction the firm has sold these coats all over the country by methods always followed in selling men's wear.

The Exclusive Dressmaker

AN AMERICAN innovation is the organization of exclusive dressmakers, the designers of costumes for the woman who wants her clothes in advance of the ready-made style, who is, in fact, the forerunner of the custom-made vogue. It has a regularly appointed fashions and arts committee that meets at stated times and the future outlook is given careful thought. Recommendations are made to the members of the association, which numbers more than 1,200, as to general lines or silhouette, with a distinction made between those for dress occasions and for street use, skirt lengths, sleeves, neck and waist lines, as well as suggested seasonable fabrics.

"Probably the general cotton industry has been most affected by the war," said a leading mill-man to me the other day. "The war was the last straw needed to knock out the props and make us appreciate what our own people could do. They did it so well, regardless of the sabotage and trouble in the mills, that I doubt if foreign cottons—except the lovely novelty ideas—will have much distribution in this country for a long time, if ever."

A book on the dye situation in those days could easily be written and the great obstacles that were finally overcome to make American dyes really count for something in the world, and to do it in the face of a war that was using so many of the necessary chemicals. Suffice that we did win out in American dyes.

Today, the makers of exclusive clothes are often the final arbitrators on these fabrics to whom mills send

(*Concluded on page 14*)

Cupid Rode in a Buggy Those Days

Romance Followed in the Wake of "Horse'n Buggy" to Church or Market; Old Dobbin Was the Motive Power in Many a Long Mile of Happiness

By HENRY B. CURRY

THIS nation's motto might well be "Let's go." Our idea of success, like the Frenchman's, is to "arrive." And our genius for invention has reveled in the practical creation of new vehicles, new devices for going and getting there.

Hence the clipper ship, the steamboat, the steamship, the submarine, the airplane and the light motor car. Hence also—but how many readers would guess what other American vehicle has been omitted from the list? It is, of course, the buggy—the greatest contribution America ever made to horse-drawn vehicles; a mechanical marvel in lightness, grace, resilience and endurance; the most universal, most popular vehicle throughout this country for a hundred years; the vehicle allied most closely to American romance; the very chariot of our Yankee Cupid.

The majority, no doubt, of all native Americans now in middle age, the majority of our men and women who courted and were courted a score of years ago, will recall "the little old buggy"—the slow-moving buggy, the self-driving buggy—as a fond-remembered frame of the story ever old and ever young. This memory alone will make the buggy dear to many American hearts.

A tender memory, and it should be tender; but there's no good reason for its being sad. Courting by buggy is not a lost art. The buggy has by no means vanished, nor is it even on its way to "ancient history." A thousand buggies were built today in these United States, a thousand more will be built tomorrow. More than a thousand buggies will be built each day of the coming year. Foreign nations are increasing their orders for our buggies.

What is a buggy, anyhow?

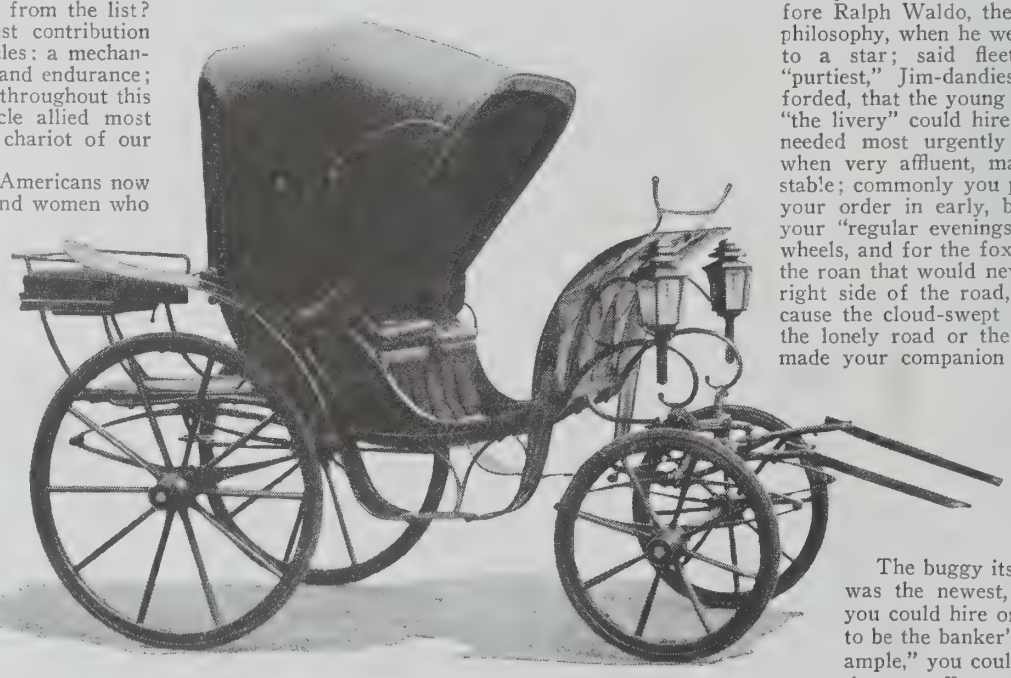
The Spaniard, as his dictionary tells you, believes a buggy is 'a light, *two*-wheeled vehicle of North American origin and drawn by one horse." The French Webster labors under like delusion. In New England, as you probably know, a buggy is not a buggy; it's a "wagon." In Old England the buggy isn't at all; but if it were, it would doubtless be a "gig" or "sulky," and lose its two front wheels.

As for the origin of the springy, cosy name—"Won't you move a little closer, Dor'thy; you'd be more comfortable"—the reader can have all the guesses in the world; no authority nor tradition will deprive him of the privilege. "Buggy" was the term employed in England about the time of our Revolution to describe "a light, two-wheeled cart carrying one person only"; the vehicle which, in a form still lighter, was transferred to American race tracks to bear the man who drove a trotter.

At any rate, it was in these States, as British history concedes, that the buggy with four wheels was first contrived. It is supposed to have been remodeled, not from its English namesake, but from an old German type of wagon, such as still remains in Germany and Switzerland. "The changes were so numerous, however, that the original model can scarcely be recognized."

Up to the beginning of the nineteenth century, and even later in the more secluded communities, the chaise or "shay," transformed by Americans from the French cabriolet or gig, preceded the buggy as our most popular vehicle; although the use of any conveyance more comfortable than the saddle, or its associate, the pillion cushion, was viewed by many rural folk as luxurious self-indulgence for persons neither ill nor old. The "one-hoss shay," of which Holmes admiringly sang, was the favored flivver of its time. If supported by straps instead of springs alone, the "shay" was not uncomfortable. It was roomy enough, too, for any quarreling lovers; and its "chaise top," with curtains or apron, afforded fair protection from the weather. It exhibited, besides, those qualities of sterling, permanent excellence in material and in workmanship that once distinguished—more generally than they distinguish now, I fear—the output of American mechanics claiming good repute.

Throughout the nineteenth century and beyond, the buggy, sometimes topless but usually reinforced with the protective features of the "shay," gained, in its native land, a universal use. North, South, East and West it proved itself the lightest, speediest vehicle, the most comfortable, the safest, most enduring and most economical, with which a single horse or even a pair could draw one, two, sometimes three persons, and small folk more or less, across the roughest road that New England rock, Virginia clay or Pennsylvania mountain could create.



No collie dog, no fireman from Manhattan, no Roman sentinel could have performed more faithful service in city, town or country. If Old Aunt Mary, across the county, was reported to be "sick abed," we "took the buggy" to reach her home, or Gran'pa had "another spell," some one "took the buggy"; and the first remark of neighbors trooping in next day was that they "saw the doctor's buggy at your gate." In great or small towns it was with the red, official buggy and the fleetest horse that a Fire Department chief raced forth on duty; and with the "likeliest rig" he could pick up, that the "vigilant" detective, policeman, marshal, constable or sheriff pursued and caught the criminal with red hands or priceless loot. Commodore Vanderbilt, like other millionaires, added no more than a second horse to display a glittering buggy when wealth and fashion drove abroad, or when the mighty men of business were conveyed in state both to and from "the Street." A venerable, fat mare took forth the somewhat dingy, creaking buggy wherein the judge, the deacon or "our leading agriculturalist" accompanied 'Ma" to church, to the "museum' or to the "opry house." Traveling salesmen "covered their territory" more conveniently with horse and buggy in the thickly settled regions; collectors also, delivery men bringing small or precious parcels. Ma or Sister making calls, took the buggy, too; though they preferred "the old horse" when Pa or Sonny would have hitched 'the colt."

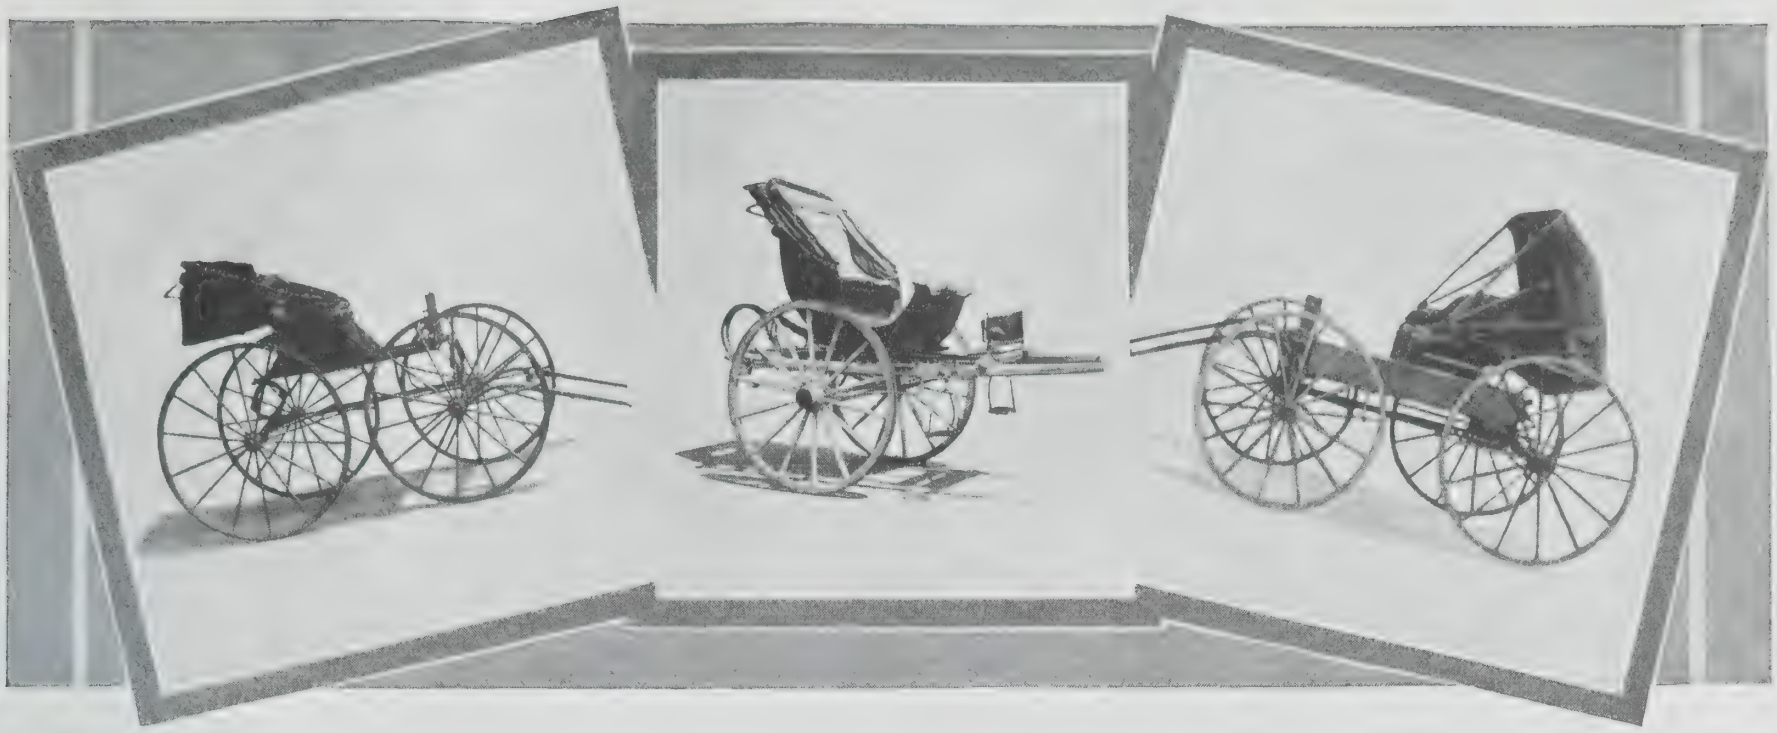
And as for "keeping company"—why, one simply couldn't make love properly or hope to gain her "yes," unless the buggy was enlisted. In town or city equally the fact was known to all. The prosperous young urbanite would drive his own; it was a luckless farm, a sad excuse for the rural home, where horse and buggy were not maintained as equals, in point of manifest necessity, with the well, the barn, the clinking, lurching wagon, or the bright and rusty plow itself. When you fell in love, you simply "took the buggy" and "took her out." And if the healthiest horse went suddenly lame on the road, and recovered quite as suddenly; if you "struck a bad stretch and had to slow down" on the best highway in the state and with the glowing moon at full—it was nobody's fault; and nobody with a grain of sense (or memory) could pretend to criticize a youth if the colt ("and he's got a strain of Ham'iltonian in him, too; goin' to make a racer") accomplished the four miles "back to her house" in just one hour and a half.

* * *

It was ever thus. Cupid still drives the buggy in many a town and village and township. And you must never make the usual novelist's error of assuming that "the little old buggy" was hitched, for courting purposes, to any "Old Dobbin" or venerable Dobinette. Long before Ralph Waldo, the American youth attained enough philosophy, when he went "sparkin'," to hitch his wagon to a star; said fleet luminary being the smartest, "purtiest," Jim-dandiest little steed that the barn afforded, that the young man could buy or borrow, or that "the livery" could hire out. If you lived in a city and needed most urgently a "horse'n buggy," you might, when very affluent, maintain your "rig" at a boarding stable; commonly you patronized the livery, and you put your order in early, before holidays and Sundays and your "regular evenings," for the Brewster with the red wheels, and for the foxy little roan with the white feet—the roan that would never start to run, or even leave the right side of the road, when you dropped the reins because the cloud-swept moon, or the distant lightning or the lonely road or the odor of fresh hay in the fields, made your companion nervous. The roan would continue to drive himself with Cupid's puny aid; would never stop and try to graze; would always pick up speed in serious fashion as if sharply urged, whenever another rig drew near and you had failed to seize the reins and flourish the whip with convincing ostentation.

The buggy itself was only pet-named "old." It was the newest, shiniest, the most stylish buggy you could hire or borrow or buy. If you chanced to be the banker's son, or some other "horrible example," you could exhibit on the avenue or before the post office one of those "de luxe" buggies. The springs would be oil-tempered, Swedish steel; the step pads, tires and curtains would be rubber; the carpet, velvet; the cushion covers, fancy whipcord; the dash, patent leather; the hub bands, dash rail and, perhaps, the ornate lamps, would be silver-plated; not to mention the russet leather harness and its silver or gold-plated trimmings.

Before an equipage so regal what would have been the climax to the splendid compliment conferred half a



century ago by Thrupp, the Briton, in his "History of Coaches," upon the ordinary, non-"luxe" buggy of this land:

'The perfection to which the American Buggy has been carried," he declared, "and every part likely to give way carefully strengthened, is marvelous. The whole is so slender and elastic that it gives and recovers itself at any obstacle. It is not surprising that, with the great advantages of extreme lightness, ease and durability, and with lofty wheels, the American Buggy travels with facility over very rough roads; and there is a great demand for them in our Colonies."

Among the reasons for the relative cheapness of these admirable vehicles the author includes what we now call "quantity production"; also, "the educated dexterity of the American workman, always ready to accept any improvement.

"These American wagons," continues Thrupp, "were modeled from the old German wagon but they have been so much improved as to be scarcely recognized. The distinctive feature of the German wagon was a light, shallow tray, suspended above a slight perch carriage on two grasshopper springs placed horizontally and parallel with and above the front and hind axletree; on the tray one or two seats were placed, the whole was light and inexpensive, and well adapted to a new, rough country without good roads.

"American ingenuity was lavished upon these wagons, and they have arrived at a marvel of perfection in lightness. The two grasshopper springs have been replaced by two elliptical springs. The perch, axletrees, and carriage timbers have been reduced to thin sticks. The four wheels have been made so slender as to resemble a spider's web; in their construction of the wheels the principle of the patent rim used in England in 1790 has been adopted. Instead of five, six, or seven felloes to each wheel, there are only two, of oak or hickory wood, bent to the shape by steam. The iron-work of the American buggy is very slender, yet composed of many pieces, and, in order to reduce the cost, these pieces of iron are mostly cast, not forged, of a sort of iron less brittle than our cast iron.

"The weight of the whole is so small that one man can lift it upon its wheels again if accidentally upset, and two persons of ordinary strength can raise it easily from the ground. The four wheels are nearly of the same height, and the body is suspended centrally between them. There are no futchels; the pole or shafts are attached to the front axletree bed, and the front of the pole is carried by the horses just as they carry the shafts; the splinter bar and whippletrees are attached to the pole on swivels. Some are made without hoods and some with hoods. These are made so that the leather of the sides can be taken off and rolled up, and the back leather removed, rolled, or fixed at the bottom, a few inches away from the back, the roof remaining as a sunshade."

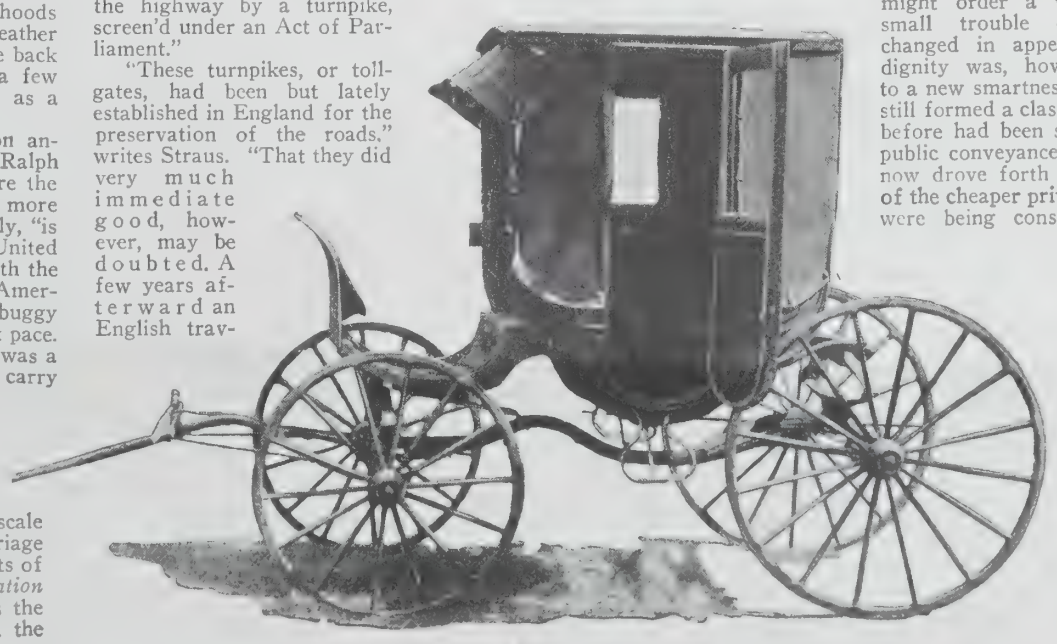
Ten years ago there was published in London another book on carriages and coaches. The writer, Ralph Straus, had visited this country a short time before the motor car began to spread. At that date, little more than seventeen years ago, "the buggy," he said truly, "is the most common four-wheeled carriage in the United States. The tourist in America will come away with the idea that there is hardly a family on the North American Continent which does not possess at least one buggy or wagon. They can be driven, too, at a very great pace. In this connection it is interesting to notice that it was a buggy which Lord Lonsdale selected in order to carry out his great driving feat in 1891, when he undertook to drive four stages of five miles within an hour, using for the first three stages one, a pair, a team, and riding postilion in the fourth.

"Stanhopes and phaetons are also manufactured in America, though on a much lighter scale than in England. Another popular American carriage is the *surrey*, which has the two-seated arrangements of the larger wagons, but is without the tray. The *station wagon*, very popular in New England, resembles the old English chariot, and differs from it only in the driving seat, which is on a level with the inside seat and directly against the front lines of the carriage-body. This is one of the most comfortable carriages in the country. The *buckboard*, even slenderer than the buggy, is hardly more than the skeleton of a carriage, but seems none the less popular on that account. The *barge* is the name given in Massachusetts to a two-seated wagon, and the word has a curious origin. It seems probable that it is a relic of the days when in that part of the country the boat sleighs used in the winter were put upon wheels in the summer. At a later date ordinary wagons were used for summer traffic, but the old name stuck. And I dare say that there are a dozen or more local names of some peculiarity in other parts of America which today are given to carriages not in the least like those to which the name was originally applied."

Straus also quotes from the *Gentleman's Magazine*:

"In my journey to London," wrote an indignant correspondent of the magazine, early in 1747, "I travell'd from Harborough to Northampton, and well was it that I was in a light Berlin, and six good horses, or I might have overlaid in that turnpike road. But for fear of life and limb, I walk'd several miles on foot, met 20 wagons tearing their goods to pieces, and the drivers cursing and swearing for being robb'd on the highway by a turnpike, screen'd under an Act of Parliament."

"These turnpikes, or tollgates, had been but lately established in England for the preservation of the roads," writes Straus. "That they did very much immediate good, however, may be doubted. A few years afterward an English traveler was grumbling at the superiority of the French roads over our own. 'Nothing piques me more,' he wrote, 'than that a trumpery despotic government, like France, should have enchanting roads from the capital to each remote part.'"



Never, indeed, before nor since, was the buggy so varied, so luxurious, so popular, so numerous. When 827 horse-drawn conveyances were counted at Philadelphia in 1794, an indignant editor protested that "even farmers now want carriages," which meant shays or coaches. But in 1905 nearly 8,000 American factories were making buggies and carriages; eight states alone were producing each year $90,000,000 worth of these corrupting vehicles, many of them for farmers! Within the next five years the making of buggies reached its height; each year brought forth at least 1,000,000 buggies, and a single year produced 1,500,000. Brewster, of New York, laid claim to the most elegant buggies; and this claim may have been disputed by Kimball of Chicago; by the Columbus Company of Ohio; or by any one of the three great concerns which made Indiana—ever the field of romance—a land of poets, novelists and buggies. There reigned Studebaker at South Bend; the big Hercules concern at Evansville; and at Indianapolis, center of culture, that Parry Company which, through "the largest carriage plant in the world," was evolving daily fifteen varieties of topless buggies and twenty varieties of the more exclusive type.

* * *

In New York City, at least throughout the central borough of Manhattan, the writer has lately been unable to find a single dealer who could sell a new buggy or new carriage. The public garages of Manhattan and the Bronx now number 1,500; but, aside from boarding stables that provide draft horses, there are only fifty livery stables in both boroughs. Here old carriages may be hired by persons who oppose the use of motor cars at funerals; here may be found, at certain stables, a few old buggies. But the leading patrons of the buggy in New York are city street inspectors and private inspectors of construction jobs—two groups who cannot keep their eyes upon "the traffic."

Ralph Straus says in his book that with the advent of steam transportation the coachbuilders set themselves to perfect the urban vehicles, which became lighter, soberer, and more various. New and less conventional models were constantly being exhibited, while for those who could not afford more than a single carriage adaptable bodies were devised. So you might order a vehicle which with small trouble could be entirely changed in appearance. The older dignity was, however, giving place to a new smartness. "Carriage people" still formed a class, but families which before had been satisfied to use such public conveyances as there had been, now drove forth in one or the other of the cheaper private carriages which were being constructed particularly for their convenience.

The sphere of the buggy has by no means been destroyed. It has, however, been so restricted and modified that horse traffic on our streets and highways has become a comparative rarity. But the glamour of the old days when buggies were buggies remains.

Tapping the Steam Boiler of the Earth

Concluded from page 6

stopped, but he did not stay. I was also told that Mark Twain wrote "Roughing It" in a camp near the Geysers, but that is not so. He wrote it in Hartford, Connecticut. Even in his day, all of the best western fiction was written in the East.

We set out on foot to see the steam wells, which are on one of the mountain sides of Geyser Canon. We first visited the one that is being drilled. It is 2,000 feet from the other two. Grant chose a spot, far from the others, where the ground was not hot and there was no outcropping of steam or hot water. He did this to see if a well could be bored anywhere in the hot belt, apparently, and strike steam.

We saw a heavy wire cable churning up and down in the pipe, lifting and dropping a drill weighing 400 pounds. The drill was going through solid rock. Steam at 13 pounds' pressure was rushing from the pipe. For my benefit a valve on another pipe was opened and water was let into the steam pipe. The steam nevertheless continued to flow for a while. Then it stopped. What the drillers called a "water cap" had been formed over the column of steam in the pipe. The stream of water was permitted to keep on flowing.

"She'll blow now, pretty soon," said Grant. "We had better get under cover."

We got under a shed. We did not have to wait long. In less than a minute the well belched forth a column of water, mud and steam that drenched all of the surrounding trees. This artificial geyser went 100 feet into the air. It sprayed and fumed for perhaps a minute and then gradually died away. The drilling machine continued to chug, up and down, and the ten-inch column of steam again rushed from the pipe as before.

We then went on to the two completed wells, 2,000 feet away. Grant fished in a pocket and brought out some cotton.

"Put that in your ears," said he. "You will need it when we get to the other wells."

I did as he told me, but with the thought that it was all nonsense. I had stood alongside locomotives. Why should I mind a steam well or two?

But in a very short time I found that Grant was right. As we neared the steam wells, both of which were open as they have been for many months, the noise became terrific. When we actually stood beside the wells I could not hear my own voice. I tried to talk to Grant but gave it up. We could communicate only by making motions. For a foot above each pipe the steam was so hot that it was invisible. High into the air, like great white plumes set on the mountain side, rose these columns of steam.

Here indeed was power. How much? Each well has been carefully measured. Each well has something in excess of 1,000 horsepower. And that power has been going to waste for three or four or five hundred millions of years. And, so far as anybody knows, it will continue to be generated for untold hundreds of millions of years. So long as the oceans roll on the surface and the earth is hot inside, that power will be generated.

Nor is that all of the story. The California hot beds, at this point, are a mile wide and ten miles long. How many wells, each capable of generating a thousand horsepower, could be sunk in them? Figure it out, if you like. All Grant or anybody knows is that one well 50 feet from the other produced the same pressure without diminishing that of the first, and that a third well, 2,000 feet away, where there was no outcropping of heat, has already struck steam and promises to be as good as either of the others.

Let us describe the two completed steam wells in terms of oil.

Engineers say that 165,000 barrels of oil would be required each year to produce as much power as these two steam wells contain. At $1.35 a barrel that is $222,750. In other words, these two wells are producing, each year, power worth almost a quarter of a million dollars.

Eleven average oil wells, producing 38 barrels a day, would not be quite enough to keep these two steam wells going.

The California oil wells, in 1923, produced approximately 262,600,000 barrels of oil worth, at $1.35 a barrel, $354,510,000. Thirty-two hundred steam wells would produce more power than can be obtained from all the oil wells in California—and Grant has all of them drilled except 3,198. At any rate, engineers say that the Geysers hot belt may conceivably yet produce more power than the California oil wells.

An average oil well costs $125,000 and lasts three years. A steam well costs from $2,000 to $4,000 and lasts—until the earth gets cold. The money of Grant and his friends has gone, not so much to drill wells as it has to buy the valley that contains the hot belt.

And it is some hot belt. I walked over what appeared to be an old crater fifty feet in diameter. Every step of the way it seemed as if I might break through the crust. Steam came through a hole a foot across and I could hear boiling and rumbling below.

Then I started at the head of Geyser Canon to walk down it. It was a steady descent, often so sharp that one could hardly make it and every moment there was danger of falling into a boiling stream below. Nor is this exaggeration. The steam was boiling. One could look down to the springs that made it and see the water in violent commotion.

The canon is more than a quarter of a mile long. Steam hissed from a hundred places. Pockets of hot water were encountered every little while in the rocks. In many places the rock was white though no steam came from the fissures. Grant held an unlighted cigar to one of them. Instantly something that appeared to be smoke began to curl up. But it was not smoke. The cigar had not been lighted, though the air that came from the fissure was very hot. Nor was that all. "Look at the other fissures," said Grant as he pointed to half a dozen within ten feet of where we stood. The same blue vapor was coming from each of them. When the vapor ceased coming, Grant again held his cigar to a fissure and instantly vapor again began to rise from the whole flock. It was a chemical phenomenon.

On the way down I saw not only hot springs but a spring of black ink. At any rate, I was told that one could write with the fluid. A little farther we encountered a wholesale drug store established and stocked by nature. Epsom salts cropped out through a crack in the rocks. Sulphur, magnesia, arsenic and many different kinds of salts.

It was an exciting walk—or rather slide—down the canon. The ground was hot under my feet. The rocks at my side were so hot that I could not cling to them.

Grant says there is in the valley an inexhaustible supply of black sand from which steel can be made with electricity. Also, there is bauxite from which aluminum is made. There is nearly everything in Alexandria Valley except a good hotel.

Such is the story of the California steam wells. Grant can get money to drill more wells—and he may have to take it. The big power companies are now interested. A large financial concern representing them is willing to underwrite the stock—for half of the stock. Grant has a big payment to make this autumn on his property, but he hopes to get money without having to pay such a price for it. At any rate, he has made good and proved he isn't crazy.

With Fashion Scouts on the Trail

Concluded from page 11

new materials and patterns asking for the comment of the maker. In fact, when a new silk, ribbon, woolen, velvet or cotton is to be launched, a prominent designer is usually asked by a mill to make a model, or a series of them, and these are photographed, used by the salesmen and later displayed in the stores handling the merchandise so that the women who are buying this material may see the costume and have a definite idea how it can be made. Today, these photographs and drawings of certain fabrics displayed in the dress and silk sections are as much a part of the department as the fixtures.

These pictures are always more or less striking and act as silent salesmen, for it is recognized that the display of the picture with the merchandise will sell thousands of yards each season. "Give a woman an idea and she will prove a steady customer," is the constantly reiterated phrase of any number of piece goods buyers. Some of these men even go further and use part of their profits to have the models actually made up and placed on the floor so that women may study and determine just how the garment is made. Seeing these garments on a form, or better, on a living manikin, the customers to the department are given a clear conception of the idea as well as learning the name of the maker and the designer of the model.

Previous to the war, when styles were supposed to change in Paris twice each year, there was always a great running abroad of importers and dressmakers to Paris, and after a few weeks there was a great rushing back. Then openings to the "trade" were given and "genuine" Paris models were to be seen in abundant quantities in this magic circle. "But," said a leading dressmaker to me, "these were lifeless, poorly mounted things without shape or line and only bewildered the poor dressmaker who had never seen the artistry of a presentation of a new model in the salon of a great Paris dressmaker."

To bring to American dressmakers some idea of the value of properly introducing a new style, this group of dress designers secured space in a convenient hotel and gave a demonstration of the most interesting of the season's offerings so that the idea of silhouette, fabric and color could be retained as a picture.

"When the war came," said the president of this organization to me, "and there were no more foreign models for us to exhibit, we pledged ourselves to patriotism and the fostering of American design in women's wearing apparel and to assist in every possible way the rise of American dress designing to a place among the fine arts, and to the fact that it is a highly trained profession."

It was a tremendous task this group took upon its shoulders, but the work has gone ahead and now there are many gratifications of this hard labor evident upon every hand. For ten years this association has been holding semi-annual American expositions of fashions. "Artistic design in dress is stimulated by competition," the president of the league holds, "also by the comparison that fashion shows give the worker along these lines. If American design in textiles and clothing could only be seen with the same understanding eyes that see foreign products, the way would be so much easier."

Outside of the "trade" it is not realized that Paris borrows good ideas from America and the seal of Paris is often given to a garment after America has tried it out in a limited way and is through with it. Paris frankly admits that this group "scooped" the world on the important forward-looking idea of a dressmakers association, organized for mutual benefit, exchange of ideas, fashions and to promote design. It may be this is too philanthropic for the older nations of the world to grasp.

"Christian General"—Saint or Sinner?

Concluded from page 10

holding a prayer meeting of his entire army before the actual business of fighting begins.

It was back in 1910 that General Feng became a Christian. Ten years before that, as a private in the ranks of the army, Feng helped to persecute the Christians. That was in the Boxer uprising, and the fact that the Christians, while being tortured and murdered, seemed so calm and undisturbed under their sufferings made a great impression upon him. He began to think what sort of religion it could be that would put calmness into the hearts of men and women, under the worst possible circumstances. He was interested, and declared then that such a religion must be of more than human origin.

Later, in 1911, when John R. Mott held meetings in Pekin, Feng attended and toward their close presented himself as a convert to the Christian faith. In 1912 he was baptized in the Asbury Church in Pekin. Along about this time he had risen to a rather high rank in the army, and he immediately saw to it that the men under him had Christian religious instruction. He did not compel these soldiers to accept his faith, but he hoped, by giving them the opportunity to know about the faith which was his, that they might adopt Christianity. Many hundreds of them did then, and more have done so since. Last April, on Easter Sunday, more than 1,000 of his men were baptized.

In 1919 during the Anfu-Chihli trouble, Feng's army went to the relief of Wu Pei-fu, and together they turned the day. Shortly after that he was given a command of nearly ten thousand men, and two years later when the first open rift between the Manchurian war lord, Chang Tso-lin and Wu Pei-fu showed on the horizon, General Feng was made the military governor of Honan, and his troops were increased in numbers. His rise was rapid, but the man seemed equal to his responsibilities. Honan province is one of China's largest provinces, covering nearly 70,000 square miles.

When, a few years ago, General Feng approved General Pao Te-chen being put to death it was one of the greatest sensations in China since the fall of the Manchu dynasty, which occurred less than a dozen years ago. Pao, nominally an ally of Wu Pei-fu and therefore of Feng, deserted with his forces to throw his strength to Chang Tso-lin, the enemy of Wu and Feng, and presumably of himself. He determined to attack Wu, and do so under pretense of moving northward to join his chief. There was every show of friendliness for General Wu, but he made an attack on Wu's troops from the rear, and completely cut off more than 2,000 of them. A fight began which lasted four days, the losses amounting to several thousand on both sides. Feng sent back troops, and won the battle. Tuchun Chao Ti, Pao's accomplice, fled to Shanghai, while Pao retreated with his ten thousand men to Kaifeng where he closed the city gates, and proclaimed himself protector of the city against the defeated soldiers of Chao Ti, whom he himself had only recently commanded.

To a certain extent there is a similarity between his entrance into Kaifeng and Feng's entrance into Pekin: both had deserted a chief, and by a peculiar coincidence, it happened to be the same chief, and both proclaimed themselves protector of a city. It was also a case of double-crossing, but in this instance Feng brought up an army, surrounded Kaifeng, and Pao surrendered. He was tried and sentenced to death by court-martial.

No one expected that the sentence would ever be carried out, for in China it is no unusual thing to condemn a man of Pao's standing to death, but it is most unusual to carry out the sentence. However, Pao was shot as a traitor. At the time Pao was executed, Feng is said to have declared, "Pao was a traitor and deserved death."

But whatever his faults, much that is good can be said of General Feng. His soldiers are all fitted for a trade. When they are in camp and there is a lull in actual warfare, they are given instruction in some trade, thus fitting themselves for an honest living when they have retired from the army. This, he believes, will preclude their turning bandit as too many of the ex-soldiers in China have done. He wants his men to become self-respecting citizens.

General Feng's army is harder working and stricter disciplined than any other army in China. His men do not loot, which is something unusual. They begin their day with a close-order drill at five o'clock in the morning, and from then till half-past nine o'clock at night, when they sing the national anthem before retiring, there is one continuous round of drills, study and work. A doxology is sung before each meal.

General Feng is proud of his men; proud and ambitious for them. One time he said: "The trouble with the Chinese soldier is that he is ignorant. He does not know his own strength or his weakness, and he has, therefore, no further confidence once he is beaten. One of the things I am teaching every man is never to give up."

He is trying to teach them perseverance, and he is illustrating his teachings through sports. Among the other sports are obstacle races. There are always two prizes offered in this race—one for the winner of the race and another for the man who falls because of the obstacle, gets on his feet again, overcomes that obstacle and finishes with credit.

"Another trouble with the Chinese army is the fact that its officers do not like to take proper responsibility. Officers who do not stay with their men, and who do not understand either their own or their men's duties, cannot be successful leaders of these men. I try to give every one of my officers this sense of responsibility. Our generals do not view a battle from a private car, hitched to a locomotive, ready to make a get-away at the first indication of defeat. If we should be repulsed, as we never have been, our generals will stick with their men to the last," said General Feng.

Saint or sinner, General Feng is an interesting character.

President, Ramsey Institute of Technology, St. Paul, Minnesota.

Comparative Research in Human Culture

THE combined population of our six largest cities—New York, Chicago, Philadelphia, Detroit, Cleveland, and St. Louis—exceeds the total population of the three Scandinavian countries—Sweden, Denmark, and Norway—by more than one-half million. When we contemplate this fact we become astounded at the many great contributions made by the Scandinavian countries to science, philosophy, music, art, literature, engineering, and all branches of human knowledge and culture. The intellectual virility of the descendants of the sturdy Vikings is, indeed, remarkable. From these countries we are greeted, time and again, with pleasurable surprises in the nature of extraordinary achievements and potent movements involving the betterment and elevation of mankind. Sometimes it is from Denmark, other times it is from Sweden, now it is from Norway that we hear of a development which is of utmost importance to the entire human race. The significance of this movement rests upon the intrinsic value of the great principle which serves as its foundation, that is, *the unity of mankind.*

The great thinker, Dr. Robert T. Browne, secretary-general of the Academy of Nations, in discussing the urgent needs of the present era, has said, "Let, therefore, all human intelligence be marshaled for the establishment of a New World Order. Let us, by conscious design, create a new world in which to live and move and have our being." The keynote of this exhortation is a *"world unity"* which may serve as a stable foundation upon which the "Temple of Peace, Prosperity and Constructive Friendship may be erected." The present-day pessimist tells us that our civilization is doomed and that the World War has wrought such irreparable havoc that no remedy is sufficiently potent to save us from destruction. Although we fully realize the magnitude of the disruption caused by this most horrible catastrophe, nevertheless, we are confident that the soil has thereby been opened for the reception of the seed of "world unity" which will eventually germinate in a New World Order. At the present time this thought is hovering, like a beneficent dew, over many countries. In Norway this seed has already sprouted, grown, and taken the form of an Institute for Comparative Research in Human Culture.

Dr. Martin L. Reymert, the eminent research psychologist of the University of Christiania, and the editor of *Scandinavian Scientific Review,* in an editorial appearing in the current issue of this journal, has given a concise synopsis of the origin and purposes which are paramount in the program of this unique institute. The inception of this movement, which had its birth at a convention held in Christiania, June 29, 1917, is due to Dr. Fredrik Stang, president of the University of Christiania. It was an outgrowth of the effects of the war. During that period the bonds of friendly scientific co-operation were completely severed. To re-establish this amicable relation Dr. Stang conceived the idea that an organization engaged in comparative research would eventually bring the world's scientists together in united effort directed toward the universal elevation of mankind. In the comparison of the cultural achievements of races and nations Dr. Stang perceived an instrument whereby mankind could be brought into harmonious unity. This thought is essentially logical because comparative research cannot do otherwise than discover those characteristics which are the common property of humanity. In striving for the unification of humanity Dr. Stang sought to achieve this goal by the exercise of some human principle which fundamentally involved and therefore inevitably led to unity in universal purpose. He found this principle in *comparative research in human culture.* As Dr. Reymert so aptly puts it: "All research in this field leads, in the last instance, back to the unity of mankind."

With this basic principle as a foundation the program of the new institute developed logically and naturally. This program, as now outlined, is comprehensive and includes the following subjects: Comparative linguistics, law, folklore, music, and religion. Studies will be made of the culture of the Arctic peoples, the Caucasian and Iranian languages. Noteworthy progress has already been made in the department of comparative folklore. Many highly important publications dealing with this subject are now in preparation.

The new institute, through these columns, extends a cordial invitation to all interested students and scientists from all countries to attend the special lectures delivered by savants from different countries at the institute building at Christiania. During the months of September and October of this year such illustrious savants as Meillet of Paris, Otto Jespersen of Copenhagen, Vinogradoff of London, Felix Krueger of Leipzig, Schetelig of Bergen, and Kaarle Krohn of Helsingfors will deliver lectures at the institute. Inquiries concerning this lecture course should be addressed to the secretary, Lector I. A. Refsdal, St. Olavsgatan 26, Christiania, Norway.

The exceptional significance of the great international movement launched by Dr. Stang will be more fully revealed as the program is unfolded.

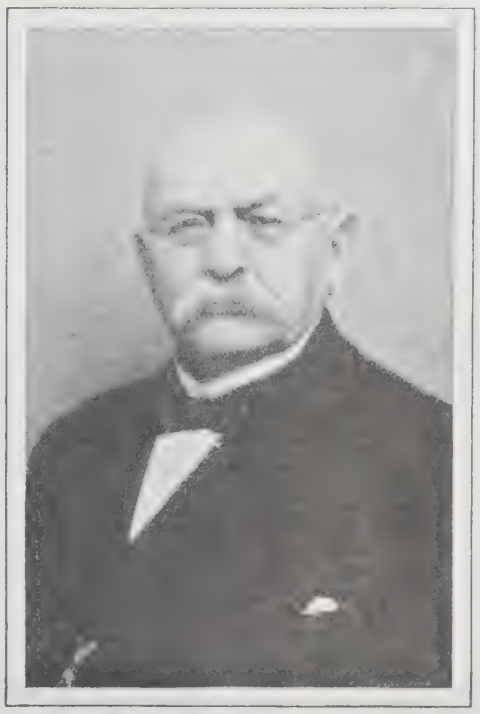
The Nobel Institute, Christiania, Norway, and the home of the new Institute for Comparative Research in Human Culture.

DR. FREDRIK STANG,

President of the University of Christiania, which was founded in the year 1811 during the reign of Fredrik VI. Rector Stang is chairman of the Nobel Committee of the Norwegian Parliament. He is also president of the Institute for Comparative Research in Human Culture. Dr. Stang is one of the world's greatest authorities on comparative law and he has written numerous treatises on jurisprudence.

DR. WILHELM SCHENCKE,

The illustrious savant who is professor of Comparative Religion at the University of Christiania, and vice-president of the Institute of Comparative Research in Human Culture.



HONORABLE GUNNAR KNUDSEN,

Leader of the Norwegian radical party for many years, Prime Minister to Norway during the entire World War, one of the foremost leaders in the modern Norwegian political renaissance, and treasurer of the Institute of Comparative Research in Human Culture.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The moccasin-like shoes of rough, untanned hide, which used to be worn in the Highlands of Scotland and in Ireland, were known as brogues. As modern shoes came in the leather was punched all over in a primitive pattern, the lace ornamentation became an elaborate sort of buckle, and the overhanging flap that kept the water out was worked over into a fringe.

The salary of the keeper of the Tower of London during the reign of Queen Elizabeth was about $500 a year. He also received all the government allowances made to offenders of high rank who were too proud to accept it. All cattle that slipped off London Bridge, all carts that fell into the moat, all flotsam and jetsam in the Thames, two flagons of wine from every vessel arriving from Bordeaux, and many other things were included in his fees.

Since January 1, last year, 1,500 bus lines have been established in the United States and 5,400 buses, costing approximately $30,000,000, have been purchased.

The women herring cleaners of the west coast of Scotland clean an average of twenty herring a minute.

Cows have been known to fall out of the steep mountain pastures in Switzerland, two having fallen to their death from a pasture on Rigi Kulm Mountain last July.

The world record for heat goes to Azizia, North Africa, where on September 13, 1922, the thermometer rose to 136.4 degrees.

Pocket gophers, prairie dogs, and ground squirrels eat eight million tons of grass a year in Arizona alone.

Many mountain peaks from 4,000 to 6,000 feet high in the Cascade Range of Western Washington have not been given names.

The National Flag Code Committee, representing more than 200 patriotic societies, are up in arms charging that "flags made in Japan are of such cheap material that, when they become wet, the colors run, and the result is something that looks more like the red flag of Bolshevik Russia than the flag of the United States."

The first prize ox at the first Smithfield Show in London was eight feet eleven inches long, six feet seven inches high, ten feet four inches in girth and weighed nearly 4,200 pounds.

The daughter of a murderer won the $1,000 contest for the best essay on capital punishment by a magazine which promoted the literary tournament.

Australian schoolboys—130 of them—will tour the British Isles and the Continent, under the auspices of the Young Australia League. The personal contact of the lads with the people of the countries visited is expected to broaden their outlook.

A copy of the third folio of Shakespeare's plays brought the record price of $8,000 at a book sale auction in London recently.

"Women have won political power only to discover that such power is illusory."—*Ida M. Tarbell.*

The highest point in the British Empire is near the equator in Africa. This peak is Mount Kibo, the highest point of which is 19,325 feet above sea-level.

"The United States now holds more than four and one-half billion dollars of gold, about one-half of the world's total. About one-half of that is superfluous at our present level of prices and is a menace. It threatens the stability of the purchasing power of money."—*Professor Irving Fisher,* of Yale University.

The largest pueblo ever found on the continent was recently discovered in the untraveled recesses of Nevada. Thus far forty houses and eleven bodies, ten of them women, have been excavated. Ancient pottery, estimated to be 2,000 years old, was found.

The source of the term *Dominion,* in the Dominion of Canada, is said to be the Book of Zachariah, chapter ix, verse 10: "Dominion shall be from sea even to sea and from the river even to the ends of the earth."

A ship's tonnage in the old days was the number of tons of wine it could carry, but it is now scientifically reckoned according to water displacement.

Kupper Bier, butcher, Hoboken, New Jersey, believes himself the oldest business man in the country. He recently celebrated his 105th birthday anniversary.

The extinct Moa of New Zealand lived largely on tough twigs of bushes. For the grinding of such food the bird required especially hard stones. When the bird finally died the pebbles endured even after its bones had disappeared and today the lucky finder is rewarded by an occasional precious stone.

Range cattle in the semi-arid regions of the West often go for days without drinking water. In cool or wet weather they go to water no oftener than every second or third day.

Cats, birds, dogs, and phonographs—but no men—will be allowed in "the first apartment house ever built for women only," now nearing completion in New York City.

Thousands of miles of highways in France and Germany are shaded by rows of fruit trees planted on either side of the road. Some of them are state owned and others are privately owned.

The largest co-operative butter and cheese organization in the world is at Hamilton, New Zealand.

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in the papers numerous interesting things about the Chinese war, but a letter is better. A man, who was at Pekin when General Feng captured it, writes to me: "I woke up one morning to find that the gates of the city were shut, that during the night General Feng's troops had been admitted to the city, and without the firing of a shot or the blast of a bugle, had occupied all the points of military importance in the city. Having witnessed a good many events like this in China, I had some experience with which to compare the present crisis. From nothing that I had ever witnessed in China could I have inferred that what was going on before my eyes would be possible in China. There before my eyes were soldiers actually behaving like gentlemen. A General had actually got hold of the Capital of a great Empire and not a single person had been killed and not a single house looted. The people seemed to welcome the orderly set of citizen soldiers, and were going about their usual avocations as if nothing had happened . . . . I had heard of the Christian General, but I confess I had no proof that his Christianity meant anything more than what passes as that in Western lands. But here were proofs of something new having entered the military life of China. During the day a proclamation was issued by General Feng in which he gave as his reason for disobeying his chief that the latter insisted on going to war with Chang Tso Ling, thus slaughtering tens of thousands of his fellow-countrymen and wasting millions in money which was sorely needed to relieve the distress caused by war and famine. Anyway, Feng has stopped the war . . . ." This is interesting in view of a strong presentation of Feng's supposed treachery elsewhere in this issue.

I read in the papers that O. O. McIntyre, one of the very best among syndicated writers, is invading the South. Glad he is. Writers, as a rule, are strangely ignorant of the meaning of the South to this nation. Its racial solidarity will yet be our salvation. Mr. McIntyre had an experience that illustrates this. Leaving New York, he says, he handed out half a dollar through a car window for a newspaper. The newsboy set thumb to nose, twiddled his fingers and made off with the change. At a station in North Carolina, Mr. McIntyre tried the same experiment. The boy handed back the correct change and said "Thank you." The explanation is simple. The North Carolina boy was an American; the New York boy was not. It is good, once in a while, for dwellers in Manhattan's foreign isle to make a trip into the United States.

I read in the papers now what first I read in Volume Four ("Aspects of Jewish Power in the United States") published by this paper, namely, that Jews cannot enter the life of America without harm to themselves. Rabbi Franklin is the latest to say so. In his *Sunday* sermon at Detroit he said that he always discouraged intermarriage and, where it occurred, always insisted on the Jewish education of the offspring, and then went on to say that it is the misfortune of the Jew that he finds himself in the midst of a money-grubbing, pleasure-mad civilization which has infected him and pulled him down from his true heights. The Jew, in other words, is the victim of America. This is the authorized Jewish claim everywhere. Even Justice Brandeis, of the United States Supreme Court, said that the looseness of Jews in America is due to the loss of protection afforded them by the ghetto. The ghetto which, on the one hand, is flung at us as an instance of Christian persecution, is on the other hand glorified as the salvation of the Jews. Americans say that it is the alien elements introduced by aliens into the theater, business, politics, literature and art that account for the looseness in America; and Jews say it is due to Americans themselves, and that the Jews are the unconscious and innocent victims of it. The contention is thus resolved to a case of fact which can easily be determined by considering, for example, what kind of a city New York was before the Jews captured it, and what kind of a theater America had before it came under Oriental influence.

I read in the Atlantic Monthly for January an article which described how a farm boy prepared for college in eleven months. It is worth putting into the hands of any ambitious youth. Adults will be interested principally in the side light it throws on the waste of time in all our school schedules. We still run on school systems that were arranged to meet the exigencies of an agricultural population. This article has one point worth noting: a boy who finds it impossible to go to high school need not therefore despair of college. Anyone who *wants* to go, *can* go. The great trouble with universities today is that upward of 50 per cent of the students present would rather be somewhere else.

I read on page five of this issue of THE DEARBORN INDEPENDENT an article which some readers may skip because of its heading. It is not about fiction so much as it is about minds. The difference between Russian and American fiction is the difference between two types of mind. The Russian is passive, expects to be crushed by fate; the American likes obstacles because he is confident he can tackle and overcome them. The American, even in his sports, puts up obstacles to be overcome. That is his psychology. Russian psychology is not universal. It is rather amusing to see heirs of the Anglo-Saxon mind-stream try to compress themselves into another mind-mold. It cannot be done. An article like this helps you to interpret the maze of minds in our country.

ABRAHAM LINCOLN.

When Lincoln Said, "I Am Master"

President Stood Firm in the Dark Days Following Fredericksburg

By WILLIAM E. BARTON

ABRAHAM LINCOLN trusted in God, and in the people. In the long run, his confidence in both was fully justified. Yet the people were fickle then as now, and there were times when Lincoln walked in the dark, trusting in a God who seemed to have hidden himself. One of the most interesting and instructive incidents in Lincoln's troubled administration has to do with the terrible winter of 1862-3, after the Emancipation Proclamation had been issued and before it had gone into effect.

If Lincoln supposed that his Emancipation Proclamation would be a popular political move, he was doomed to cruel disappointment. The proclamation succeeded in rousing the most bitter hostility of the proslavery element of the North, and by a singular inconsistency it seemed to give some of the extreme antislavery advocates a new ground for their attacks upon Lincoln.

The North contained a very strong element which had little or no sympathy with the conduct of the war. The so-called "Copperhead" movement, which later manifested itself in deliberate plans for the overthrow of the government, was in 1862 a strongly intrenched political power opposed to the President. The friends of McClellan turned against Lincoln, alleging that he had first failed to co-operate with this brilliant general, and then ruthlessly removed him from command for reasons of political jealousy. Haters of the Negro professed to see in the Emancipation Proclamation the menace of Negro equality and of social demoralization. Extremes met. There was a considerable element in the North composed of those who were bitterly opposed to slavery, and who blamed Lincoln severely for not freeing the slaves earlier. Indeed, there were not a few who declared that the President, with what they called his customary vacillation, would find a pretext for recalling his proclamation before January 1, 1863. These people found common ground with those who blamed him for freeing the slaves at all.

The Democratic party declared that the Emancipation Proclamation had now made abolition the actual purpose of the war. No longer, they affirmed, was the preservation of the Union the paramount object; the real purpose for which white men were expected to lay down their lives was to give freedom and social equality to the black man. This distinctly was not what they had undertaken to do, nor did they propose to do it.

The Congressional election in Maine occurred early in September, 1862. Then, as in subsequent elections, the results of that state were closely watched. "As goes Maine, so goes the Union," had already become a proverb. Maine usually elected a Republican governor by a majority of from 10,000 to 19,000. In 1862, Maine chose a Republican governor by a majority of only 4,000, and, for the first time since there had been a Republican party, Maine sent one Democrat to Congress.

Ohio voted in October, and sent to the National House of Representatives fourteen Democrats and only five Republicans. The Democratic vote in that state exceeded the Republican by a majority of 7,000. In Pennsylvania, where two years before Lincoln had had a majority of 60,000, the Democratic vote exceeded the Republican by about 4,000, and the Congressional delegation was divided. Indiana sent to Congress only three Republican representatives and eight Democrats. New York went Democratic by a majority of nearly 10,000, electing Horatio Seymour as governor. New Jersey, which had voted Republican in 1860, went Democratic in 1862. Michigan remained Republican, but its majority was reduced from 20,000 to 6,000. Wisconsin divided its delegation evenly. Illinois, Lincoln's own state, went Democratic by a majority of 17,000, and her Congressional delegation was eleven Democrats to three Republicans. New York, New Jersey, Pennsylvania, Ohio, Indiana, and Illinois all failed to support Lincoln in 1862.

The Emancipation Proclamation

TO THEIR everlasting honor the New England States, and Iowa, Kansas, Minnesota, California and Oregon, stood better in their support of the President. But when the returns were all in, the Democrats, who had only forty-four votes in the House in the Thirty-seventh Congress, had seventy-five in the Thirty-eighth.

In that crisis the border states stood by the President. He had not underestimated the importance of holding them loyally within the Union, and true in their support of the administration. They in 1862 furnished a sufficient number of pro-administration members to save Congress from going over to the opposition.

But among the Republicans were not a few members so bitterly hostile to Lincoln for his cautious policy that it could hardly be said that the President had in Congress any more than a bare working majority.

The elections of 1862 were "off-year" elections. Off-years are often fatal years. The elections of 1862 were not fatal to Lincoln's hopes, but they weakened his support, and prepared the way for a bitter and painful campaign in 1864.

The Emancipation Proclamation went into effect on January 1, 1863. There was a great celebration in Music Hall in Boston, and Ralph Waldo Emerson read his "Boston Hymn" on that occasion. In many other places there were enthusiastic meetings and warm expressions of approval. But that is not the whole story. There was much emphatic disapproval, also.

When Stephen A. Douglas died, he was succeeded in the United States Senate by Honorable Orville H. Browning. He and Lincoln had been friends for many years. Both were Kentuckians by birth and so were their wives, and both were Old Line Whigs. Browning was perhaps the most intimate visitor at the White House during Lincoln's Administration. Senator Browning kept a diary in which he told minutely about the weather, his flowers, the people he met and the speeches he made. That diary has lately been acquired by the Illinois State Historical Society. It has not yet been published, and when it appears it will be the most intimate story of what went on in the White House since the publication of Gideon Welles' diary. On the day following the proclamation's taking effect, Senator O. H. Browning recorded:

> Friday, Jany. 2, 1863. At Mr. Seward's for dinner at 6. No one else there. I asked him why the Cabinet did so useless and so mischievous a thing as to issue the proclamation which had been issued, the only effect of which was to unite and exasperate them in the South and divide and distract us in the North. He replied by telling me an anecdote of a man who after the termination of the Revolutionary War could not rest till he had a liberty pole erected in his village; when asked by his neighbors what he wanted with a pole, and whether he was not as free without it as with it, he would always answer, "What is liberty without a pole?" And what is war without a proclamation? We played whist with Mrs. Seward and Miss Fanny till 9 o'clock, and then Seward and I went over to the President's. We found General Butler there who had just arrived from New Orleans. He read to us his parting address to the people of New Orleans, and General Banks' proclamation upon assuming command. His conversation indicated that he was a very ultra abolitionist. He gave it as his opinion that the only way to put down the rebellion was to destroy slavery. This class of people does not seem to know that armed rebellion stands between us and slavery, and that to get at the latter we must first crush the former.

A Mental Gethsemane

THERE had been a time when the President and Browning seemed to be of one accord in this matter, but that time was past, and it never came back. Browning still supported the President, but confessed this sharp dissent from his view of the way to deal with slavery. And Browning was one of many scores of thousands. Browning hated slavery, as Lincoln did, but wholly disapproved of Lincoln's way of getting rid of it.

If Lincoln was at first disposed to attribute his rebuke at the polls to any other cause than the unpopularity of his methods, he was not lacking in friends who told him with entire and almost brutal frankness their view of the case. We are making considerable use of the "Diary" of Senator Browning. It is our latest and in some respects most intimate authority upon the life of the President in those days. Browning was at the White House almost daily. When the Lincoln family was in trouble, as it was when Willie died, Senator and Mrs. Browning spent not only their days but their nights at the White House. Perhaps Lincoln never had any intimate friends, but if he had any in this period, Browning was one of the closest. Shortly after the November elections in 1862, Browning had a long visit with the President:

> He was apparently very glad to see me, and received me with much cordiality. We had a long familiar talk. When speaking of the results of the recent elections I told him that his proclamations had been disastrous to us. That prior to issuing them, all loyal people were united in support of the war and the administration. That the masses of the Democratic party were satisfied with him, and warmly supporting him, and that their disloyal leaders could not rally them in opposition. They had no issue without taking ground against the war, and that we would annihilate them. But the proclamations had revived old party issues, given them a rallying cry, capital to operate upon, and that we had the results in our defeat. To this he made no reply. I added that the Republican party could not put down the rebellion—that no party could do it—that it required a union of all loyal men in the free states to give us success, and without that union we must disastrously fail. To all this he fully assented.

Misfortunes never come singly. Soon after the elections of November, 1862, came the appalling news of the Battle of Fredericksburg. On December 13, 1862, General Burnside, with 125,000 men, crossed the Rappahannock on three pontoon bridges and made a frontal attack on Lee, who had 80,000 men well intrenched on the opposite side of the river, his right commanded by Stonewall Jackson and his left by Longstreet. If geography has anything to say about battles, that was a foolhardy proceeding on Burnside's part, and bitterly did his army pay for his folly. The Federal loss was 12,800 against Lee's loss of 4,300. The Federal Army retreated north of the Rappahannock, and the country was compelled to be thankful that the army was able to get back without being captured or destroyed.

The country was well-nigh desperate. On the afternoon of Tuesday, December 16, 1862, the Senate adjourned about half-past one, and the Republican members held a caucus. We have an account of it in Browning's "Diary." Lyman Trumbull bitterly assailed the administration, denouncing the President and Seward. Ben Wade declared that the Senate ought to go in a body to the White House and demand the resignation of Seward. He favored the creation of a Lieutenant General "with absolute and despotic powers," and he must be a Republican in politics. "He said a member of the Cabinet (it is apparent from subsequent speeches in the caucus that the member of the Cabinet who furnished Wade his information was Chase) informed him that there was a back-stairs and malign influence which controlled the President, and overruled all the decisions of the Cabinet, and he understood Mr. Seward to be meant. He was for demanding his removal."

Browning and others spoke in defense of Lincoln, if not of Seward. A motion to adjourn was offered, and was opposed by Trumbull and others, but prevailed. The caucus took recess for a day without violent action. Browning's comment on the speeches of Trumbull, Wade, Grimes, Fessenden and the others who had attacked Seward, and with him the President, is interesting:

> These ultra-radical, unreasoning men, who raised the insane cry of "On to Richmond" in July, 1861, and have kept up a war on our generals ever since, who forced through the confiscation bills, and extorted from the President the Proclamations and lost him the support of the country, are now his bitterest enemies, and doing all in their power to break him down.

The next day, the caucus assembled again. "Many speeches were made," says Browning, "all expressive of a want of confidence in the President and his Cabinet, some of them denouncing the President and expressing a willingness to vote for a resolution asking him to resign. Most of those who spoke were the partisans of Mr. Chase, and excepted him from the censure they bestowed upon the Cabinet."

Browning wrote:

> In my remarks of yesterday I said I knew there was no more honest, upright, conscientious man than the President, and that I knew him to be in favor of the most vigorous prosecution of the war, and that he intended to prosecute until every state was restored to the Union and every rebel compelled to submit to the authority of the government.

Apparently Browning did not speak on the second day. Charles Sumner moved that a committee be appointed "to wait on the President and represent to him the necessity for a change in men and measures." This motion prevailed almost without dissent. The committee was composed of Senators Jacob Collamer, of New York; B. F. Wade, of Ohio; William Pitt Fessenden, of Maine; Ira Harris, of New York; James W. Grimes, of New Hampshire; Charles Sumner, of Massachusetts; Lyman Trumbull, of Illinois; Jacob M. Howard, of Vermont; and Samuel C. Pomeroy, of Kansas. It was not a committee whose composition could afford much comfort to the President.

That Lincoln was heartbroken over this revolt of the Senate, and for a time almost in despair, we might assure ourselves if we had no record of the fact; but we have a record again in Browning's "Diary" of Thursday, December 18, 1862:

> In the evening went with Mr. D. W. Wise of Boston to the President's. The servant at the door reported that he was not in his office—was in the house, but had directed them to say that he would not be seen tonight. I told the boy to tell him I wished to see him a moment and went up into his room. He soon came in. I saw in a moment that he was in distress—that more than usual trouble was pressing upon him. I introduced Mr. Wise who wished to get some items for the preparation of a biography, but soon discovered that the President was in no mood to talk upon the subject. We took our leave. When we got to the door the President called to me saying he wished to speak to me a moment. He asked me if I was at the caucus yesterday. I told him I was, and the day before also. Said he, "What do those men want?" I answered, "I hardly know, Mr. President, but they are exceedingly violent against the administration, and what we did yesterday was the gentlest thing that could be done. It had to be that or worse." Said he, "They wish to get rid of me, and I am sometimes half-disposed to gratify them." I replied, "Some of them do wish to get rid of you, but the fortunes of the country are bound up with your fortunes; and you must stand firmly at your post with a steady hand. To relinquish it now would bring upon us certain and inevitable ruin." Said he, "We are now on the brink of destruction. It appears to me the Almighty is against us, and I can hardly see a ray of hope." . . . He added, "The committee is to be up and see me at 7 o'clock. Since I heard last night of the proceedings of the caucus, I have been more distressed than by any event of my life." I bade him goodnight and left him.

The President Triumphs

THE days that followed were no better. On the very next day "old Francis P. Blair came into the marble room" and sent for Browning. The country was very nearly ruined, he told Browning, and advised Browning to go to the President and tell him to get rid of Stanton and Halleck. A little later Reverdy Johnson came to Browning's seat in the Senate and told him the country was going to the devil, and that there must be a new Cabinet. Browning recorded that he did not wish to thrust his advice upon the President, but he met the President that afternoon and the President told him he was trying "to keep things along." But Browning declared to his "Diary" that things could not be kept along much longer at this rate.

Lincoln met the committee first alone, and then in-

"She Was a Stepmother"—Sally Bush

From This Woman Lincoln Received That Inspiration Which Led Him On; She Sent Him to School and "Encouraged and Urged Him to Study"

By THOMAS J. MALONE

ALL too little is known about her. Much of her life was passed in small towns and rural places on the western frontier, a life like millions of other lives in humble walks—poor, circumscribed, toilful, handicapped, obscure. But ten years of that life were of transcendent value to her country and to the world. In those ten years she was the chief influence in developing the boy who was to be the towering figure of his age. Her days in that decade were taken up with the endless duties of housewifery in a large family, in a rude one-room house that had none of today's conveniences. She was uneducated, as the world defines education, but she had character.

She was the stepmother of Abraham Lincoln.

What she thought in those months and years of drudgery; what dreams she had, if she had dreams; what visions saw, if any, we do not know. With a husband who did not share her interest and her faith, in a neighborhood that placed no stock in book learning, she somehow kept aglow for that boy the light of ambition and effort. In her mother's heart she nursed her own counsel, but we have the son's testimony of what her love and care, her trust and encouragement, meant to him.

In those ten somber years of a boyhood spent in choring, grubbing, woodchopping, corn cropping, hog butchering and fence making, at home or "hired out," she gave the young Abraham the three things he most needed—love and trust and encouragement. And in what did she encourage him? In a thinly settled land of illiterate adults, of few and poor schools, of few books and few newspapers, of mediocre aspirations, she encouraged, yes, urged him to study! Nothing else goes so far to explain the most enigmatical character in American history, to point the mainspring motivating that growth of a neglected, half-wild, uncouth rustic to the man who continues to be the marvel of each new generation.

And she was a stepmother!

The glory of her shines upon the stepmothers of today and of tomorrow in this land, in all lands. In her woman's keeping was the fate of America, perhaps even of peoples everywhere aspiring to be free.

She first appears in history as Sally Bush, a young woman living in Elizabethtown, Kentucky, whom Thomas Lincoln had met before his marriage to Nancy Hanks. The Bushes are reputed to have been a family somewhat superior to the general run of folk about them. Sally, a tall, light-complexioned girl of pleasing appearance and especial neatness in dress, is said to have "held her head high." She refused Thomas' suit and married, instead, one Daniel Johnston, the town jailer, who seems to have had a steady job. Right there Daniel drops out of the record, except indirectly. A few years later he dropped out of life entirely, leaving Sally Bush Johnston free to do the thing that was to give her a distinguished place among the women of all time—to become, by marrying the bereft Thomas Lincoln, the stepmother of Nancy Hanks' lonely and misunderstood son.

Abraham's mother had died in his tenth year, scarcely two years after their moving from Kentucky to Indiana. Whether of the "milk sickness" or tuberculosis, the year the family had spent in that "half-faced camp"—a wretched hut of poles, open on one side—probably had something to do with it. After thirteen months of widowerhood, Thomas Lincoln left the boy, his thirteen-year-old sister, Nancy, and their cousin Dennis Hanks, in the later teens, who was living with them, and went back to Elizabethtown to try his luck again with the Widow Johnston.

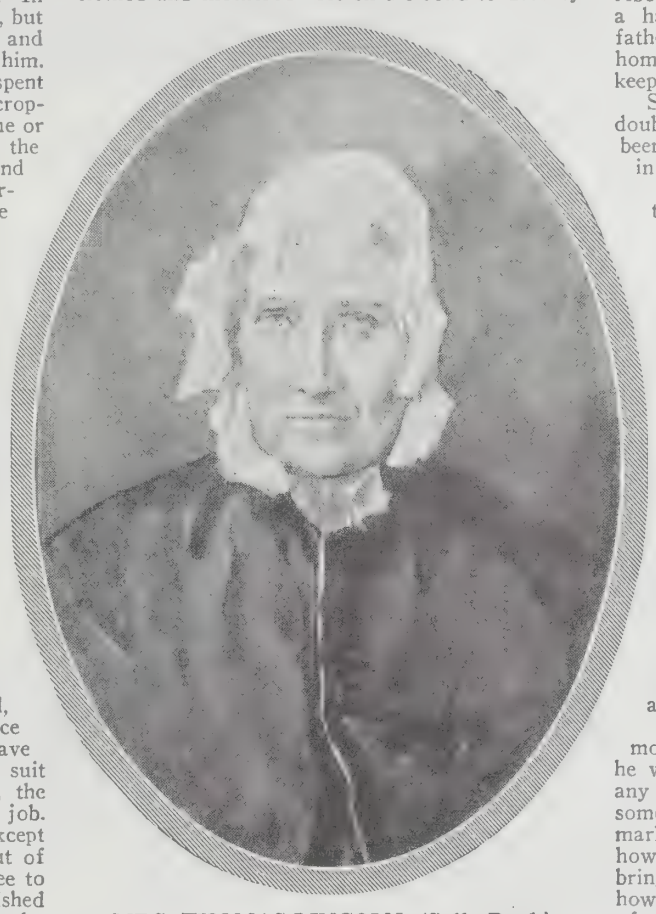
Mrs. Johnston had liked "Tommy" Lincoln and she was lonely. Also, she had three children of her own to bring up. This time she said yes. There have been unpleasant stories that Lincoln made out to her that he was more prosperous in Indiana than he really was—but when does a suitor black-eye himself anyhow?

What a moving that was in December of 1819, of the Johnston possessions to the Lincoln cabin in Indiana! A four-horse wagon it took, loaded with those household stores that to the little asking, easily contented Thomas Lincoln seemed almost sinful in their grandeur and to the Lincoln children marvelous indeed—a table, chairs, that famous and much-written-about bureau, pillows and other bedding, cooking utensils, and even knives and forks.

Let credit be given where deserved, even though belated: those possessions were probably the result, at least in part, of the industry and thrift of that Daniel Johnston of unpraised memory. He had a vicarious share in the rejuvenation of the Lincoln home that ensued, an honorable part in contributing to the comfort and happiness and inspiration which the young Abraham knew from the day of his widow's arrival.

The Thomas Lincoln house in Indiana was much like the houses Sally Bush had known him to have in and around Elizabethtown. It was the conventional one-room log cabin, without floor, door or windows. What she would have thought and said and done if her husband had brought her to the old half-faced camp, which still stood a few steps away, one does not know; but one can feel safe in believing that she would have buckled to and made the best of it. That is just what she did in the actual circumstance. If she had been led to expect better things, she did not moon over what she found. She was in what today's parlance calls "a good sport."

The Lincoln children were promptly washed, clothed and mothered—set on the road to decency



MRS. THOMAS LINCOLN (Sally Bush)

and comfort and self-respect. Little John Johnston's spare garments were put on the lanky Abe. Matilda and Sarah Johnston's wardrobe jointly contributed to bedeck—is that the word?—his sister. Thomas Lincoln was not a self-starter. Now he had the influence needed to get him started and make him go, however spasmodically, a firm but kindly "boss" who should hold him to a standard of living for which, left to himself, he had no hankering. There was a woman in the house.

This was the combined Lincoln-Johnston family in that one-room Indiana cabin: father, mother, Sarah (formerly Nancy) Lincoln, Abraham, their cousin Dennis Hanks, John D. Johnston, and his two sisters. Four years later John Hanks, another cousin, was taken in and lived with them four years.

What would follow in like case today; in many, if not most, cases in any day? Jealousies, rivalries, neglect, favoritism, abuse, wrangling, coldness, what not!

But what characterized the newly enlarged home at Little Pigeon Creek? Love and fairness and kindliness and good will, a directing spirit that realized duty and accepted responsibility, that rose above the squalor and the heart-sickening conditions and shaped the meager instrument of a seemingly blind chance into a power that preserved the Union of States, freed the Negro, exalted the common man and the thoughts and purposes of common men, and gave the enduring proof of the equality of opportunity that is America.

There was a woman in the house, a house that was not divided against itself.

These are the adjectives which those who knew her best applied to her: thoughtful, energetic, sensible, sprightly, talkative, handsome, industrious, neat, tidy, proud, pure, decent, kind-hearted, charitable, pious. "That pre-eminently good woman, Sally Bush," writes Lamon.

Speedily the new Mrs. Lincoln got Tom Lincoln going. In no time that indifferently capable carpenter, assisted no doubt by the boys, had put in a floor where no floor had been, hung a door and cut holes for windows, which were then covered with greased paper for panes. The Lincoln children slept in real beds, warm, comfortable, happy in the care of the new mother who took the place of the well-loved other and filled it so competently through all the succeeding years.

Abe could read—his own mother had taught him that—but he could do little beyond reading. He had had a few weeks of schooling in Kentucky; the new mother wanted him to have more. For a few months that very year, the children were sent to the nearest school, a mile and a half away, and again three years later. When seventeen, Abe went a short time to another school four and a half miles away; but the distance, and the father's conviction that his services were needed at home or among the neighbors, prevented his keeping on.

She urged him to study. Other stepmothers, doubtless, have loved their foster-children, have been kind to them, but here was specific service in the direction most needed.

His study, it will be recalled, consisted in the reading, re-reading and in great part committing to memory of every book he could lay his hands on. A few books he owned, but the rest he borrowed in the neighborhood, that often-quoted galaxy including the Bible, Aesop, "The Pilgrim's Progress," Weems' "Life of Washington," Shakespeare, Burns, and a school history of the United States. These he would read aloud to the home folks, when they would listen to him, and his mother, at least, always would.

She understood that boy, saw good stuff in him and, like all loving mothers, thought he would make something of himself, might even become a great man. There must have been many times in those ten years of haphazard "growing up" when Abe was downhearted over his progress toward education, as he often became later. Who but his mother was there in that house to cheer him on, strengthen his resolution, bolster his faith in himself, to "encourage and urge him to study"?

How the boy Lincoln studied, his stepmother herself has told us: how in his reading he would jot down on boards, if without paper, any matter that seemed particularly worthwhile—sometimes the full passage, sometimes only a few marks—guarding the boards until he had paper; how he would then rewrite it, repeat it, and often bring it and read it to her, seeking her opinion; how he had "a kind of scrapbook" for safekeeping of such things as especially interested him.

Her relations with her stepson were summed up in a historic interview, after his death, given to one of his biographers. She said that Abraham had never given her a cross word or look, nor refused to do anything she asked him to do, that she had never spoken crossly to him in all her life, that his mind and hers "seemed to run together."

After Mr. Lincoln left the family home in 1830, on passing his majority, he continued until his death an affectionate interest in his mother's welfare, going to see her occasionally, sending her money at times and paying her what proved to be a last visit when President-elect before going to Washington.

What would not a diary by this woman, of those ten years from 1820 to 1830, mean to an American who still seeks to understand the miracle of Abraham Lincoln? But she kept no diary; her time was taken up with more immediate and pressing occupation. No one has written her biography; the known facts of her life have seemed too few and too commonplace. Some years ago Robert Todd Lincoln, grandson of her and Thomas Lincoln, placed a modest stone over their graves in a country cemetery in Coles County, Illinois. More recently the Lions' Clubs of Illinois erected, for them both, a more pretentious marker there.

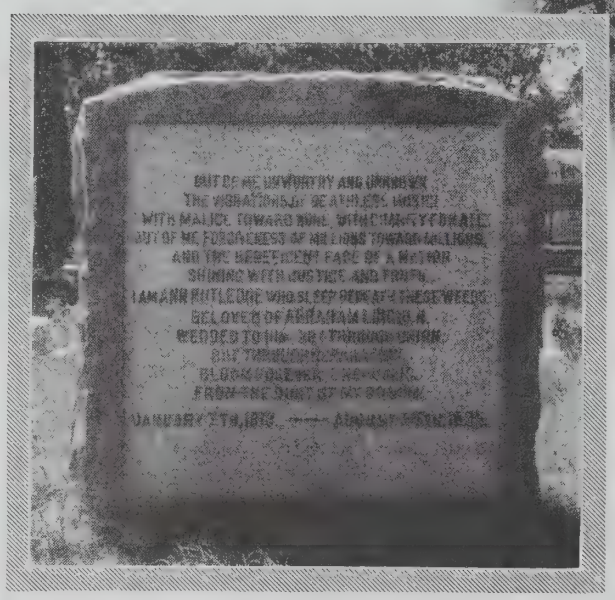
There should be a monument to her alone reared, not by relative nor by specific organization nor by government, but by all the people of the United States who hold dear the life and service of Abraham Lincoln and who would honor the memory of the noble woman whose nurturing made him what he was. And its inscription should be, without fulsome detail:

TO THE WORLD'S GREATEST
STEPMOTHER
She Loved Abraham Lincoln,
And She Urged Him to Study

An Interview With Springfield, Illinois

By WILLIAM L. STIDGER

The Lincoln home, where the martyred President lived for several years and where he received the news of his nomination.



The grave of Ann Rutledge with a memorial written by Edgar Lee Masters.

THEY came from all over the world, the 101,000 who visited the tomb of Lincoln between the first of January of 1924 and November 1 of that same year. And each year the number is increasing. Mr. Fay, the custodian of the Lincoln Memorial, says:

"They come from the Orient, they come from Russia, France, England, Germany—everywhere. They come in delegations, and they come on their honeymoons; they come in excursions of school children, and in college groups. Negroes come, and whites come, every day. Our register reads like a list of the great of the contemporary writers, statesmen, and world-leaders; a Who's Who of the world."

In Springfield one sees the Presbyterian church and the pew in which Lincoln sat.

The next stop is the room in which Lincoln delivered the classic "House Divided Against Itself" address. This room is preserved as a part of the great legislative halls of the capitol building and is a shrine to all lovers of Lincoln.

Then near the Wabash Railway freight depot a stone with a bronze plaque marks the spot where Lincoln stood on the rear platform of a railroad car and delivered his famous farewell to Springfield address, an utterance replete with humble awe and prophetic foreboding.

I talked with several men who heard that address and while there is a difference of opinion among them as to the exact phraseology of this address, they all agree on its spirit. (It is true that the address, in the form we have it, was written by Mr. Lincoln on his knee, directly the train started.) There had been some enemies in Springfield. Lincoln knew that they were present. But most of those present were close friends and neighbors. In this beautiful address, with carefully chosen phraseology, Lincoln bound enemies and friends alike, together in love and good will. I was told that most of those present, enemies and friends, wept at these simple, sincere words of farewell; that there was a subtle spirit in the very atmosphere, and that Lincoln seemed to feel the weight of coming events. The look on his face was that of loneliness.

The Lincoln tomb, visited last year by more than 101,000 persons between January 1 and November 1. David Lloyd George, Clemenceau, Joffre, the King and Queen of Belgium, Nansen, the explorer; Paderewski, Roosevelt, Woodrow Wilson, Coolidge, and others have signed the register.

Then there is the tomb of Lincoln, the great shrine of the city of Springfield. A dozen floral wreaths were lying about that tomb. Two were from Mr. Coolidge, one while he was Vice-President, and one after he became President. One was from David Lloyd George. The actual tomb is in the crypt, where lie buried, besides Lincoln, the wife and deceased children of Lincoln.

I have never stopped at the Lincoln shrine, winter or summer, when it has not been crowded with people.

One of the curious autographs that Mr. Fay owns is that of the shortest poem ever written on Lincoln. It was given by Joaquin Miller, and it sums up Lincoln's strength in two tremendous lines:

"LINCOLN

Joaquin Miller

The strength of Hercules
The sense of Socrates."

Our next visit on this pilgrimage is to the home of Henry B. Rankin. Mr. Rankin has been an invalid for forty years. He lies upon a cot, with a radio outfit within reach, and when he grows lonely or tired of reading he reaches over, as he himself said to me, "and connects up with the earth." He heard President Coolidge. In such a way millions might have heard Lincoln, had inventive genius been as advanced in that day as it is now.

Mr. Rankin knew Lincoln from boyhood when he was a page in the Illinois legislature, and later when he was a partner in the law firm of Lincoln and Herndon.

He reached over and showed me an autograph album, procured when that was as much of a fad as the crossword puzzle is now. One day he walked into Lincoln's office with this book in his hand.

Mr. Lincoln saw the book and said, "Mr. Rankin, what is that book?" He was always interested in a new book.

Says Mr. Rankin, "I told him that it was an autograph album and that I would be glad to have him put his name in it."

"Did he do it?" I asked eagerly.

For answer Mr. Rankin opened the book. There upon a page was the autograph given that day.

> "Today, Feb. 23—1858, the owner honored me with the privilege of writing the first name in this book—
>
> A. Lincoln."

Below that there is another autograph, that of William H. Herndon, Lincoln's law partner and it reads more flourishingly:

> "The struggles of this age and succeeding ages for God and man—Religion—Humanity, and Liberty with all the complex and grand relations—may they triumph and conquer forever, is my ardent wish and most fervent soul-prayer.
>
> Wm. H. Herndon."

Feb. 23rd. 1858.

No other autographs were ever entered in this book.

I was permitted, at the offices of the John T. Stuart law firm, to read a shoe-box-full of Lincoln correspondence, most of which has never been published, because of the personal matters therein discussed.

These letters reveal a little-known side of Lincoln, which will be very interesting when the time comes that they can be released.

I was permitted to have a copy of a part of one of these letters which I understand gives these sentences the first light of publication. This letter was a letter from Mary Lincoln, and the excerpt I have reads:

"To Honorable John T. Stuart, Springfield, Illinois.

"My dear Cousin:

Owing to much indisposition during the past year and while in Canada for months, seldom seeing an American paper, the controversy which appears to have been going on regarding my great and good husband's religious views, have entirely escaped me.

My husband's heart was naturally religious—he had often described to me his noble mother reading to him at a very early age from her Bible, the prayer she offered up for him, that he should become a pious boy and man, and .... what an acceptable book that great book was always to him. In our family bereavement it was there he first turned for comfort. Sabbath morning he accompanied me to hear dear, good old Dr. Smith preach and .... his last words to his dear friends on leaving Springfield for Washington with an impending rebellion before the country were words uttered in great anxiety and sadness, 'Pray for me.' These words revealed his heart.

Very truly yours,

Mary Lincoln."

Inside the Lincoln tomb, over the crypt where Mr. Fay receives the thousands of visitors every year who make a pilgrimage to Springfield.

From here we go to Lincoln's home; the house in which he lived until he left for Washington. Here is the room in which he received the word of his nomination; the room reproduced in John Drinkwater's great play on Lincoln.

One photograph displayed here showed a great crowd in front of this house celebrating Lincoln's nomination. It was a delegation from Kansas and they had a large sign, reading:

"WON'T YOU LET US IN?

KANSAS!"

In addition to fifteen Lincoln shrines, near Springfield, is the spot where Grant took his first command, and this

(*Concluded on page 13*)

February, Mother of Seven Immortals

Shortest Month of the Year Has Produced Galaxy of Famous Men

Samuel Pepys,	born February 23,	1633
George Washington,	born February 22,	1732.
Charles Lamb,	born February 10,	1775.
Abraham Lincoln,	born February 12,	1809.
Charles Dickens,	born February 7,	1812.
John Ruskin,	born February 8,	1819.
Thomas Alva Edison,	born February 11,	1847.
. . . . .		
Walter Bagehot,	born February 3,	1826.
Daniel Boone,	born February 11,	1735.

By THOMAS L. MASSON

CONSIDERING that February is not only the shortest month of the year, and is not noted for equability of conduct or warmth of temperament, she has been kind to us in her production. If she had contributed nobody else but Charles Dickens, she would have done more than most months. It is certainly an assuring sign of sanity and a return to wholesome thinking, to know that Dickens is now being more widely read in this country than ever before. As I grow older and reflect more completely upon the great books of the world, Dickens looms larger and larger. He is the supreme story-teller of the world, the great artist and portrayer of humanity. His range is as wide if not wider, much more intimate, than that of Shakespeare.

Balzac may have been a more profound artist, but the very weaknesses—or shall I say loosenesses—of Dickens, his so-called bad writing, his descent to bathos—all these things but add to his power. This paper, however, is not intended to be a critical literary estimate; it is intended only as a gesture of respect to diminutive February, and to consider briefly some of the extraordinary qualifications, the likenesses and contrasts of these immortals born by this frail month—not the first instance of such a little mother producing such big boys.

Pioneers, Philosophers, Statesmen

YOU may ask me why I have set Walter Bagehot and Daniel Boone apart from the others, or why, if they are not quite big enough to go with the others, they should have been included at all. I will explain. I put them in to make good measure, even though this is not necessary. Very few people in this country know anything about Walter Bagehot. As a matter of fact, I think he probably had more influence, as books go, over Woodrow Wilson, than any other writer. Wilson once told me as much himself. I know of no better way to come to an understanding of our own Constitution, than to read Walter Bagehot's book on the British Constitution. He is by far the most penetrating writer on politics and economics I know of, not even excepting Edmund Burke.

As for Daniel Boone, he was the great pioneer, the model for all pioneers. His autobiography also might be considered a model for all men; it consists of but a few pages, mostly dates, short descriptions of his travels, and the Indians he killed. He was the first man to explore Kentucky, and built the first fort. He married Rebecca Bryan, had five sons (two of whom were killed by the Indians) and four daughters. He was captured by the Indians, taken to Canada, and finally released. During this period his intrepid wife, as he states, "thinking me killed, by the Indians, had transported my family and goods on horses through the wilderness amid many dangers to her father's house in North Carolina." Anyone who has the idea that the women of those days remotely resembled some of the flappers of today must revise his opinion. No wonder they produced tall men. Boone's wife and daughter were the first white women that stood on the banks of the Kentucky River. His life and feats so impressed the poet Byron, that Byron wrote an ode to him which begins with these lines:

Eulogy
On Colonel Boon, and the Choice of Life.
By Lord Byron.

Of all men, saving Sylla the manslayer
Who passes far, in life and death most lucky
Of the great names which in our faces stare,
The Colonel Boon, backwoodsman of Kentucky,
Was happiest among mortals anywhere:
For nothing but a bear or buck, he
Enjoyed the lonely, vigorous harmless days
Of his old age in wilds of deepest maze.

Byron then goes on to scorn the life of cities and to praise all pioneers, in the line: "Corruption could not make their hearts her soil." No adequate biography of Boone has been written. His picture is that of a mild-mannered man, his face of an intellectual cast. He was a great fighter; had imbibed a deep sense of religion, and there is no record of anything but the most perfect understanding between himself and his wife. They were probably too busy fighting the elements even to be tinged with that kind of neurosis which, in these softer days, afflicts so many of our "best people."

How different from Boone is Bagehot, who passed his life writing about other men! To know why I have not added these two to the immortal seven, is because they both lacked in two essential qualities, both of which seem to me to be necessary to produce the highest type of man (I confess, however, that I rather weaken with regard to Boone). These qualities are the creative gift first, and, second, the power to perpetuate your own work.

Pepys, for example, cannot be considered a great creative artist. He had the faults of ordinary human beings, some of them highly exaggerated. He was, from point of character, in many respects a petty man. But consider what he contributed to the permanent amusement and information of the world! You might be amazed if you knew the people in this country who read him constantly. I happen to know that Booth Tarkington is one of us. Years and years ago I was fortunate enough to pick up a complete edition of Pepys in eighteen solid volumes; since then it has been my chief intellectual and, indeed, emotional consolation, not altogether because it so intimately portrays a period, as because it reveals a man who, in spite of the distance in time between him and us, is indeed very much like anyone else. Pepys was born about sixteen years after Shakespeare died. Although his father was a tailor, this is no term of reproach, for he came from a very old family. He married the pretty daughter of a ne'er-do-well Frenchman. He held an office which amounted, in the language of our day, to that of Secretary of the Navy, and he was a good, in fact, a superior, official. He lived to be seventy, and his diary recreates the period in England, of Oliver Cromwell, the Long Parliament, the return of Charles II, and so on. His diary was written in shorthand, and there seems to be some question as to whether he intended it ever to be published, as it was without a key. His system of shorthand, however, was that of Thomas Shelton, who lived in the first part of the seventeenth century.

Pepys had trouble with his pretty wife, or it would be better to say that she had trouble with him. He complains about this constantly. A new edition of his work has just been published, which is now declared to be complete, except in a very few places. Pepys is included in this birthday list, therefore, not on account of his creative gift, but because what he wrote is still going so strong.

If the reader will now be kind enough to run over my list again, temporarily separating the creative gift from what we may call the quality of permanence, he will see more quickly the line of division. It may be said that neither Washington, Lincoln, nor Pepys possessed great creative minds like those of Dickens, Ruskin, Lamb, or Edison. Yet Lloyd George has pronounced Lincoln's Gettysburg Address the finest piece of oratory extant. The fact is that Lincoln did have a creative mind. It was revealed in his boyhood, and perhaps more than this in the selection of his material during the Civil War.

The same thing may be said of Washington. Both Lincoln and Washington, however, were alike in their powers of endurance, in their capacity to take punishment. To me it is quite apparent that certain great men who rise at certain crises in the world's history are molded for the occasion; this does not mean that they may have been specially and individually designed; it means only that they have the capacity to stand the strain, more developed than their fellows. They rise up in response to a universal demand. If you ask me to account for them in any other way, my reply is that nobody else has been able to account for them in any better way.

We are here confronted by a mystery which has baffled the most painstaking psychologists, biologists and philosophers. Either the great man himself, as in the case of Ruskin, takes the initiative, takes the bit in his teeth, so to speak, and creates a revolt against the age, or else he appears to be selected by Nature or Providence or God as the best instrument for the purpose in hand. We can speculate as much as we please, but nobody really knows. Ruskin, for instance, inherited great wealth. He was brought up in the lap of luxury. He never went to school—that is in his youth. His mother taught him, making him read the Bible through six times before he was twelve. When his father died, he left him what is equivalent to about six hundred thousand dollars in our money. Ruskin proceeded to get rid of it. He gave nearly a hundred thousand dollars to a relative, who lost it. His love affairs can scarcely be explained by any ordinary standards. He fell in love with a French girl when he was quite young, and she married someone else. His parents arranged his marriage with Euphemia Chalmers Gray, who was the daughter of old Perthshire friends. The marriage never consummated and after several years of unhappiness, his wife sued for annulment and married Millais, the famous painter.

Ruskin, the "Light Bearer"

WHEN he was forty Ruskin fell in love with Rose La Touche. "One must not look too closely into an episode like this," remarks Arthur Christopher Benson, one of the biographers. Ruskin met Rose when she was ten. For years thereafter he was passionately in love with her. His letters to his American friend, Charles Eliot Norton, are full of expression of this love. She grew up to be very religious and cast him off because he was an "unbeliever." When they parted she was 24 and he was 53. Ruskin went insane and recovered. Benson writes of this period:

". . . . he was to bear one of the heaviest trials that can fall to the lot of man; he was to pass into that delirious shadow-world of insanity, to be mocked by his own visions, in that awful twilight land in which a man cannot distinguish between truth and hallucination."

Ruskin, without doubt, wrote the most beautiful prose of his age. He was the greatest dynamic force against tradition and convention that the world has seen in art circles; more than this, he was, as Anne Thackeray Ritchie says of him, "a light bearer."

The reader will understand, I am sure, that, in this brief sketch, I am attempting no formal or chronological review, but am only bringing into such bold relief as I can the figures of these great scions of February, the little mother among months. For one thing, she has produced three of the tallest men known among great men. It has been recorded that in the measurements sent to a tailor in London for Washington's clothes, his height was put at six feet two in his stocking feet. Lincoln was six feet four. I have been unable to find any accurate figures about Boone's height but that he was very tall, well over six feet, I think there is no doubt. He begins his autobiography with these words:

"It was on the first of May, 1769, I resigned my domestic happiness." He then goes on to say that he started out into the wilderness in company with "John Finley, John Stuart, Joseph Holden, James Money and William Cool." And a little later, without emotion, he says briefly that his eldest son was killed by the Indians. It was apparently with these companions that one day he loomed into view at the head of his small band, and is described by his biographer, Cecil B. Hartley, as a man of "full size." He must, therefore, have been at least six feet.

An Immortals' "Who's Who"

IN CONSIDERING these immortals, it may be well for us now to ask in what respects were they similar and how did they differ? Let us resolve them into the form of a Who's Who.

Samuel Pepys (1632-3-1703. Born February 23.) Boyhood spent in country and town. Recreation as boy, shooting with bow and arrow. Went to St. Paul's school, London. Was first at Trinity Hall, Cambridge, afterward transferred to Magdalene College. Obtained a scholarship, but was admonished for getting drunk. Had a fine literary and artistic taste, and was also fond of music. Fond of his wife, but—to put it mildly—uncertain in his love affairs.

George Washington (1732-1799. Born February 22.) No adequate biography of Washington has been written. The Rev. Dr. Weems is responsible for a lot of stories of Washington's boyhood which are extremely doubtful. He had small education, was no grammarian, and Paul Leicester Ford, perhaps his best delineator, says his mother "tried him not a little." He was fond of his wife's kith and kin, but had trouble with his own. It was apparently through these difficulties that his own character was early developed. He married a widow and was fond of her children. Very little is known of his wife, "beyond the facts that she was petite, overfond, hot-tempered, obstinate, and a poor speller." Washington spoke of her as the "partner of all my domestic enjoyments." Washington was regarded as one of the wealthiest men of his time. He refused to accept any pay for his military services. He was abused without mercy during the war; his capacity to endure was the basis of his true greatness. His letters to Congress are some of the most moving documents in all history.

Charles Lamb (1775-1834. Born February 8.) Tinged with insanity, a "bencher of the Inner Temple," Lamb's life was a tragedy, his sister killing his mother when insane, yet Lamb is undoubtedly one of the great humorists, a creative genius of the most delicate fancy, and the originator of a special type of essay. He had smallpox at five. He was lame and stammered, which prevented him from a university appointment. He left school at 14, and at 17 became a clerk in the accountant's office of the East India Company. After 33 years as a clerk, he rejoiced in the freedom gained, but discovered that his idleness was no help to his writing. A most delightful biography of him has been written by E. V. Lucas, who is now on the staff of *Punch,* and is, I understand, slated for its next editorship.

Abraham Lincoln (1809-1865. Born February 12). Lincoln's early struggles, his love story, his engagement to his wife, his relationship to his mother—these are all well known to American readers. Much about him, however, remains to be cleared up, and while much about him that has been written is fine, his real biography is yet to come. Many stories about him are extremely doubtful.

Charles Dickens (1812-1870. Born February 7). The early part of "David Copperfield" is a practically accurate account of Dicken's own boyhood. It reveals better than anything else where he got the enormous background of tragedy, pathos, poverty which developed in him the greatest creative range in English literature. He did not get on with his wife. Foster, his biographer, tells the story with great skill and affection.

John Ruskin (1819-1900. Born February 8). Ruskin is an illustration of the fact that genius rises above money. His precocity, his loves, his overwhelming passion for Turner, his humor, his charm—all these things united with his contempt for previous standards—make him one of the great forces.

Thomas Alva Edison (1847——. Born February 11). The story that Edison came of a common family and started as a newsboy from necessity has long since been exploded. He was first taught by his mother. School conventions did not interest him. As a boy, his creative genius was not confined to material limitations. He built his laboratory on a train, and learned what he wanted to know while the train waited. The story of his life is the story of light on dark places.

Now of these seven men born in February, two of them (Dickens and Ruskin) had distinct difficulties with

They Don't Believe in Mortgages

Mennonites a Quaint People—Good Farmers Who Keep Clear of Usury

By WILLIAM A. M'GARRY

HOW to get along under the present-day economic system without paying continued tribute to the money-lenders is a problem that every individual faces at some time or other. Many workmen and merchants never solve it, and even during times of steady work and good business fail to get beyond a mere livelihood. It is a boast of many financiers that everybody is dependent on *the elaborate credit system developed in the last quarter century* to a point not equaled anywhere else in the world. This is merely another way of saying that everybody in the United States pays interest, directly or indirectly, to the groups that control money and credit.

But some men have managed to escape the burden of usury in all its varied forms. Prepare a mortgage map of the United States showing in black all property laden with debt, and in white the lands, factories, dwellings, and so on, owned outright by their users or occupants. White areas of considerable size would be shown in some of the most fertile farm lands of Pennsylvania, Virginia, West Virginia, Missouri, Indiana, Colorado, New York, Maryland, Nebraska, and Ohio, with smaller patches in many other states. In Pennsylvania these white areas would be found in nearly half the sixty-seven counties of the state, while in the rich agricultural districts of Lancaster, Bucks, Montgomery and Chester counties the white would be predominant and almost continuous. Wherever a particularly large white patch appeared on such a map it would indicate settlements of a people descended from some of the earliest inhabitants of the United States and generally known as Mennonites, branches of which sect are called Amish and Dunkards. Four hundred years and more of agricultural experience have taught these people that the burden of usury is too heavy for the average man to carry. As a consequence no other large groupings of American farmers are so free of mortgages and other forms of debt, although there may be many individuals scattered about the country. No other group of farmers is so well-to-do and independent, and none is making more rapid progress in the acquisition of new lands. A map of the type suggested for a period of years would show that each of the Mennonite white patches reveals a regular, consistent growth, year after year, in good times and in bad. In fact, the rate of growth would be larger in bad years when farmers who had not learned to avoid the credit system were being sold out.

A Mennonite farmyard at Bird-in-Hand showing the quaint costumes which are the regular garb of the children.

The story of how this has been accomplished had its beginnings in some of the bloodiest persecutions the world has known, away back in the fifteenth century in Central Europe. Although there is ample evidence of this in contemporary records, it is almost an unwritten story insofar as popular history is concerned. Books on the Mennonites are few and incomplete, and even the best of their own historians emphasize religious traditions and almost completely ignore the economic factors that are making these people the dominant agricultural element of the United States. But, generally speaking, the Mennonites and their branches are in that position because they have maintained principles learned in the days of their persecution and have been willing to endure hardship and discomfort rather than contract debts.

The Amish, whose largest colony is in the "garden county" of Lancaster, in Pennsylvania, have held more closely than any of the other branches to the ancient rules. On May 20, 1718, when taxes imposed by William Penn were becoming what they considered burdensome, the Amish Mennonites of Lancaster County sent to Penn a Memorial of which the following is an extract:

"We came to Pennsylvania to enjoy freedom of mind and body, expecting no other imposition than that declared by God. As we have been taught to hurt not our neighbors, so do we expect that our neighbors will do us no injury. As we cannot contract debts, we require no law for their recovery.

"If we should be so unfortunate as to have indigent neighbors we shall provide for their wants. The same inclination that tends to the preservation of our children prompts us to the care of every member of our flock. Conscience, the voice of God, deters us from the commission of crime. As we commit no crime, hard is it for us to suffer from those of others. We ought not to be compelled to pay for the maintenance of convicts.

"We ask you for permission to pass our lives in innocence and tranquillity. Let us pursue our avocations unmolested. We respect your rights, respect our customs. We ask nothing of you but what the Word of God can justify."

Street scene, illustrating the characteristic headgear of Mennonites.

With some modifications, the foregoing offers a fair picture of the customs and aspirations of present-day Amish. On that foundation they have built an empire within the United States—on that, and cheap money. A secretive people, it is difficult for an outsider to get at the actual facts of their commercial transactions. There is some evidence that the rule against contracting debts has fallen into disuse, but it is a certainty that no "Amishman," as they are known in their own settlements, would think of going to a bank for help. Self-help is still the rule. If the barn of an Amishman is struck by lightning and his crops are burned, his neighbors of the same faith nearly always take from their own harvests enough to see him through the ensuing year, if he needs help. Without any more definite laws than those indicated in the letter to William Penn, each Amish settlement—and to a certain extent each Mennonite community—has developed a degree of co-operative effort far beyond the dreams of modern industrial experts. A Mennonite settlement is perhaps the nearest approach to a self-sufficient community to be found anywhere in the world

Bankers flourish in these communities, but not on loans to the Mennonites. A member of that faith who needs money today and who has no conscientious objection to the contraction of a debt borrows it from a neighbor of the same sect. The maximum rate of interest charged in such transactions is 4 per cent, but, according to outsiders who have become intimate with these people, a large proportion of the inter-sectarian loans are made at 3, 2 and 1 per cent, and often without interest charges. A farmer who has had a succession of misfortunes is cared for in such manner, exactly as he was in the days of William Penn.

"Dividing the farm" is a practice never followed. Many American farmers have formed this tendency. As a man grows older and his sons attain their majority and wish to settle down, the father assigns to each a certain section of his lands. The Amish and Mennonite system is to furnish each son with enough free capital to buy his own land—ranging from $1,000 to $1,500 as a rule. It is this custom that accounts for the rapid spread of these people as landowners. As recently as ten years ago the land holdings of the various Mennonite branches in Lancaster County were pretty well confined to the northern part of the county, along the original ten thousand acre settlement made in 1709 to the north of Pequea Creek. Today the settlement has spread far to the south.

In an account of this first settlement written at the time of the arrivals from the German Palatinate at the invitation of William Penn it was stated: "The men wore long red caps on their heads. The women had neither bonnets, hats, nor caps, but merely a string around the head to keep the hair from the face. The dress both of female and male was domestic, quite plain, made of coarse material after an old fashion of their own." Since then some changes have been made. As in other matters, the Amish adhere more closely than the other branches to the old-fashioned dress. The young Amishman cuts his beard only until he marries. Then it is permitted to grow. All the men wear what would be called today "bobbed" hair—cut off straight at the neck. They dress in black at all times, using plain homespuns. Their hats are the broad-brimmed, low-crowned headpieces in common use two and three hundred years ago. On the street the women wear a black bonnet with long flaps falling over the shoulders and back. The women now dress as a rule in white, and sometimes in subdued colors. But the form of the gown never varies. It would be considered utterly out of date by the average modern woman. Children of the Amish in their Sunday-go-to-meeting clothing wear long trousers and flat hats in imitation of the garb of their fathers. The skirts of the women are long and full in the fashion of bygone days.

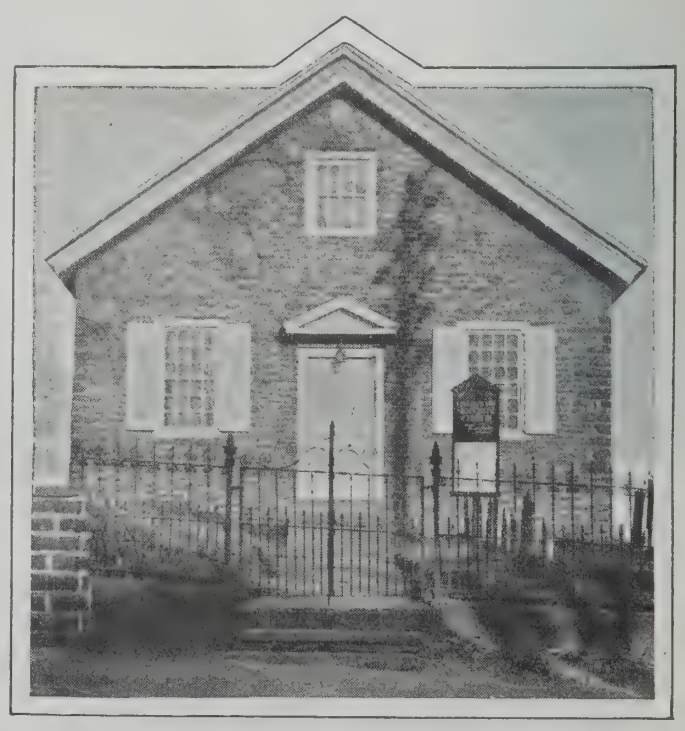
More or less anonymously, members of the sect have been denounced at times as "unprogressive" and accused of being surly and taciturn with outsiders. Criticism also has been voiced of their opposition to the marriage of their sons and daughters with persons outside the faith. But many writers have pointed out that this custom has done more than anything else to preserve the purity of the ancient racial stock. It is true that in many of their manners and customs the Mennonites and their allied branches today are identical with the German peasants of the seventeenth century, and their kin in Holland and Switzerland. But it is also true that these people today have the oldest American family tree of any group in the country.

"While New England today laments the loss of its sons, swept into the vortex of national life setting westward," wrote E. K. Martin, one of the historians of the Mennonites who is not a member of the sect, "complaining that her stony acres must soon be tilled by an alien race or left barren and valueless, the Mennonite lands of Eastern Pennsylvania still remain in the descendants of the first hardy stock, who hold them by ancient indentures, supplemented by grant from father to son, reaching backward in one ever-strengthening chain of titles to the original patents of Penn, implanting in a glorious Commonwealth a true conservatism, and adorning it continually with renewed evidences of prosperity and thrift."

As farmers it is said they have no equals in America, if anywhere in the world. They are slow to adopt new methods. For many years large groups of them refused to put up such protective devices as lightning rods—and, in fact, some of the finest barns in the Amish settlements, where the question of cost does not enter, are still without this protection. It is only in recent years that insurance has been generally adopted. With customary thrift and canniness, the Amish formed their own insurance company for the protection of their barns and crops from fire, storm, and water failure. It now writes the bulk of their business on co-operative rates.

Historians outside the sects have admitted, too, that all the branches still adhere to the custom of succoring the friendless, and their enemies. In the early days of the settlements few of the sects took part in elections. Nearly all of them still avoid public office, and many of the Amish do not vote. Although all members of the family work hard, the members of the denomination have been noted for centuries, both in this country and in Europe when they were not being persecuted, for the spacious comfort of their homes. The effort is always to avoid even the semblance of ostentation, particularly of the exterior. The Mennonites stick to old-fashioned methods. Oil lamps and candles are still in use in many

(*Concluded on page 13*)



The oldest Mennonite church in America. This edifice, located on Germantown avenue, Philadelphia, was built more than 200 years ago on a tract originally set aside for church purposes in 1689.

Mr. Ford's Page

THERE has been so much "success preaching" in this generation that any well-founded statement regarding the great increase of opportunity is discounted at the start. The sullen type of mind goes so far as to regard it as another kind of "opium of the people," something designed to postpone their unrest, and feed them with unreal hopes in order to soothe them.

We have seen the rise of a temper which does not want opportunity; it wants the full fruits of opportunity handed to it on a platter. This temper, of course, is not American; it is imported from lands and by races that have never been able to see or use opportunity, and have existed on what has been given them. This is a distinction that should always be made when surveying the national mind. It is true, however, that, although this temper may not be American in its origin, it has infected parts of the American mind like a disease; sullenness is infectious.

Now, the fact is that a generation ago there were a thousand men to every opportunity, and today there are a thousand opportunities for every man. Affairs in this country have changed just that much.

There are implications for the individual in this, of course, and also for society. It is almost impossible to understand some phases of the rise of industry without taking the former scarcity of opportunity into account. The development of some forms of business has been attended with what appears to be a certain form of warfare. This has been greatly exaggerated by the writers of the alleged histories of certain industries, who wrote from personal motives. It is never quite safe to accept, as the full account of an action, the story of the man who was beaten in it.

But there is enough of fact to indicate that when industry was being evolved under the pressure of the people's needs (and that is the only force that brought it into being) some men had large vision, others had limited vision, and the men of larger vision naturally outran the others. Their methods were sometimes immoral, but it was not their immoral methods that accounted for their success; it was their larger vision of needs, and ways and means to fulfill them. There must be a tremendous amount of right vision in anything if it is to survive dishonest or cruel methods of putting it across. To attribute success to the wrong method is a common fallacy. We hear of some men who are "too honest to succeed." That may be a comforting reflection to them, but it is never the reason for failure. Dishonest men sometimes succeed when they have qualities which exceed in serviceable value their dishonesty. Honest men sometimes fail because they lack other essential qualities to go with their honesty. It is safe to say that in the success of men who are dishonest, all that it tinctured by their dishonesty inevitably fails.

However, when industry was growing up, opportunities were limited. Men saw along one track and all of them wanted to get on that one track. Naturally, some of them were shoved off; there were more men than opportunity. A great deal of the fierceness and cruelty of competition, as we hear of it in the old days, was due to its being a struggle for self-preservation. There were not enough of the big opportunities to go round.

But, with the coming of these industries, a whole new world of opportunity was opened up. It will be well for anyone at this point to pause and think how many doors of creative activity every industrial advance has opened. It has turned out, through all the fierce competitive fights, that no man could succeed in his own opportunity without creating many times more opportunities than he could begin to grasp. Instead of the single track which attracted all ambitious men at the beginning, there appeared a multitude of tracks, with room enough for all.

And that process has gone on so rapidly, that we have come to a place where there are more of these tracks than we have men to run on them, more things to be done than we have men to do them. Time spent in trying to unfasten other men from their opportunity is time wasted. There is not only room enough for all, there is more room than our initiative and energy can occupy and use.

Here then is a formula to interpret the past and to prevent our carrying its mistakes into the present. When there were more men than opportunities, there was struggle of a very fierce and often inhuman kind. But to assume that this is the essential law of business practice and business success in these days when the condition is reversed is to misread the facts. From a condition where it was believed that competition decreased business, we have advanced to a condition where we know that competition increases business. That is because opportunity exists in multitude where before it was scarce. We must adjust business temper to the new times.

This is just one instance where the increase of opportunity affects business practice.

There is another. Much publicity is given dishonest business these days, more than ever before, not because there is more dishonest business than before, but because it has become such an out-of-date thing. The history of dishonesty in business in the United States begins, like the immoral methods of early competition, in the scarcity of opportunity. Dishonest business never had any *excuse* for existing, but there were times when it was at least *understandable*. Nowadays it is not even understandable.

To show how backward even our people are in their appreciation of business philosophy, notice the comments on the "smartness," "shrewdness," "cleverness" of business crooks. They are not smart, they are not shrewd, they are not clever. They are not intelligent. What passes for their smartness and shrewdness and cleverness is just the measure of the public's stupidity.

These crooks are not business men and have not the slightest tincture of business mind, else they would know how to do a business that stands on its own feet and is guaranteed liberty to exist. Being intellectually incapable of doing real business, they have become crooks. They could not succeed in legitimate business. The fundamental root of the matter is not in them.

The great swindles began in an age when opportunity was scarce. Swindling is out-of-date today because honest opportunity is unlimited.

Just as the invention of steam chased the pirates off the sea, so the increase of opportunity has outlawed cut-throat competition and business swindling.

The way any disease is destroyed is by preventing the conditions that foster it; if there are no suitable feeding places in the body, disease germs cannot live in it and begin their destruction. Disease germs only begin to tear down that which has been allowed to get into bad condition. And, in the same way, swindlers—the disease bacilli of the economic body—will find feeding places only where there exists the flabby, non-resistant state of mind which expects something for nothing. That is the condition of moral flabbiness in which the disease of swindling works. Where there is decay, there the vultures are gathered together.

With opportunity as plentiful as it is, for those who have eyes to see, these three evils become outlawed and hopelessly out-of-date. Cut-throat competition, as if there were only one field; swindling, as if there were no unoccupied legitimate field; and being swindled, as if there were no sound and decent method of increasing one's savings—this trio of blunders, the fruitage of scarcity of opportunity—are old traces of an old time.

The times have improved faster than men have. The old pressure toward poverty or dishonesty no longer exists. The term "up-to-date" has gained a new meaning.

THE modern increase of opportunity has had two good effects on business: first, in doing away with the old cruelties of competition, for there is now room enough for all; and, second, in abolishing the last vestige of excuse for dishonesty, since there is now so much honest business to be done that if a man prefers swindling it is simply because he has not the ability to do a business based on service and value. When opportunity was scarce, and there were a thousand men for every chance that offered, they crowded each other out; they invented deceptions and regarded wild speculation as the proper exercise for business energy. But nowadays, when there are a thousand opportunities to every wide-awake man, the situation is reversed. Opportunity, in its widening of the economic field, has been highly favorable to man's moral civilization.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

France Has Gone Too Far

A GOOD argument is not enough. France has a good argument in regard to her debt, but she neutralizes it by elements which do not appear in her argument. A generous creditor will often see extenuating circumstances in a debt such as France has created, if the debtor is unable to pay and is himself of generous mind; but when the debtor is simply averse to paying, and is anything but a generous creditor to his own debtors, the case is greatly altered. The actions of France are at odds with her argument.

This has had recent and unmistakable confirmation in the speech of Deputy Marin who made the definite statement that French blood wiped out Allied debts, that one squared the other, and was cheered to the echo for his statements. There seems nothing incongruous to the French in thus measuring the blood of her sons by the money of the Allies. And she seems oblivious also of the fact that other nations and races have lost their sons. The point is that Deputy Marin spoke the soul of France, and uttered the intention of France, that she will avoid payment by any means, even to the pitting of shed blood against the figures of indebtedness.

Yet, with the tenacity of a Shylock, France holds Russia to its monetary obligations, although the loss of Russian blood in the service of the Allies was the greatest of all the human sacrifices of the war. The world sometimes forgets that fact concerning Russia. France gives no intention of remitting a sou of the Russian debt. And in that, France is giving a modern representation of that Parable of the Unmerciful Servant which was told in ancient time.

The opinion which the world must hold of France is that national thrift more than anything else inspires her present attitude, and this opinion is strengthened by the fact that France was quite forehanded in building her plea. As early as 1915, when the war was hardly a year old, the records show that France was deftly preparing the ground for a question about debts when the war should cease. And so insistent was this preparation that, as the records show, feeling against France's Allies and their alleged "neglect" was allowed to run so high, that the Allies, especially Britain, had to start a movement among French officials to compel them publicly to recognize the great extent of the assistance which France was receiving from the outside world.

This paper has given in full, and in their own phrasing, the claims of the French. But we have no hesitation in saying that, if France pushes the issue that she saved the world, it can be clearly shown that her Allies saved France from utter destruction. Their interests were linked, to be sure, but had the Allies withheld their hand France would have been a vassal German state these last ten years. Her doom would have been immediate. The doom of the rest of the Allies was by no means certain, was certainly not imminent, and very probably not destined to occur at all. If France insists on being thanked as *the* savior of humanity, she may push the courtesy and consideration of her Allies too far, and be compelled to hear in Anglo-Saxon terms some wholesome truths.

This sense of opinion in the outside world seems to have been felt by the French Government which counseled the Chamber that cheered Marin, not publicly to post his speech. That at least shows some sense of foreign opinion.

It is time, anyway, for the United States in its own name to protest against being held up as a money haggler by a nation that has wilfully and with ulterior motives introduced a question of "honor" into a matter of business. Honor should always exist in business, but honor is misused when introduced as an excuse for the performance of contracts. It is really a little worse than the German excuse for violating Belgium.

Ibanez and the King

AN IMPORTANT point in international ethics was raised by the attack made recently through the press by Blasco Ibanez on the King of Spain. How far shall bygones be bygones? How far shall the slate of recollection of the past ten years be wiped clean? How shall the nations of the world comport themselves, today, toward those of their number who outraged so grievously, in the decade just past, the world's highest sense of right?

Although every effort has been made in interested quarters to becloud the fact, there is really no doubt as to what was the attitude of Spain during the World War. How far King Alfonso was responsible for this attitude is really beside the point. There can, however, be no doubt that Spain sided with Germany as long as she thought—as she did until almost the last moment—that Germany was going to win. She did not do this openly. Officially, she was neutral, but, unofficially, as the notorious story of the German embassy in Madrid during the years of the war shows clearly enough, she was very much the reverse. Spain's record in connection with Germany's ruthless submarine campaign has faded with strange completeness from popular memory, but the dreary story of Spanish ports thrown open to German U-boats, of allied ships sunk without effective protest in Spanish territorial waters remains to be revived at any moment.

The question is how far should it be revived, or, rather, how far are the nations of the world justified or well advised in allowing the facts to sink completely from memory and neglecting to take them into account in forming its present estimate of and expectation from Spain?

The same, of course, is true of Germany. The tendency of the human mind to think that two blacks make a white is terribly deep seated. If it condemns, as an act of aggression, the French occupation of the Ruhr, it finds it very difficult to prevent itself from concluding that the action of France, in some mysterious way, wipes out the incomparably more terrible aggression of Germany that preceded it. The fact that the devastated regions were, to a very large extent, deliberately devastated; that with cool calculation Germany so wrought that whether she won or lost the war she should win the peace—these are facts too lightly ignored today. The same is true in regard to the Spanish record. No one wants to harbor animosities, but neither does one want to ignore essential factors in forming an estimate of national character.

If the past were only the past! But it never is. It is but a continuous strain of tendency which will keep on breaking out until it is finally destroyed or transmuted.

Goldwyn's "Psychoanalysis"

NO SMALL number of harsh things have been said about Dr. Freud. Perhaps the worst blow is yet to be delivered, when it is shown that the psychology which he has systematized is not universal and therefore not generally applicable. But pending that, and in view of the paucity of nice things there is to say about Freudism, it is pleasant to report the famous doctor's cold turn-down of Mr. Samuel Goldwyn. What was in Mr. Goldwyn's mind can only be imagined, but the press agent who heralded Mr. Goldwyn's royal progress in Europe announced everywhere that the "master" was going to see Dr. Freud in the interest of a "master" film. This can only mean that Goldwyn was seeking some way of putting on the screen the horrible sexual insanities which Dr. Freud and his interpreters have put in technical writing. It was a vision worthy of a Goldwyn's enterprise!

However, it is reported that in response to Mr. Goldwyn's telegraphic approaches and heraldric advertisements, Dr. Freud wrote a one-page letter—"I do not intend to see Mr. Goldwyn."

Of course, it must have been a blow to the enterprising and unsuspecting Samuel. But why wait for Dr. Freud? Or would Dr. Freud's name be necessary to put the stuff across over Will Hays' veto?

An Important Discovery

"VERY much the newest patent medicine of all is suggested in a story which comes from New York," says the *Manchester Guardian*. "Briefly, the tale goes that a bacteriologist has discovered a germ so small that it lives as a parasite on the ordinary germs which produce such disastrous diseases as typhoid or pneumonia." The *Guardian* then follows with a series of whimsical, not to say skeptical, comments on this matter, which it rounds off by saying that "It would be awkward if the human patient were cured of his germs but died of their parasites."

The Amsterdam Academy of Science takes a different view of this matter, however, for it has awarded its highest honor to Felix Hubert d'Herelle, the Canadian scientist who discovered ultra-microbes, the road is being opened for the cure of human disease germs. D'Herelle has been awarded the Leeuwenhoek gold medal, a distinction of which the previous recipients include Pasteur, in 1895, and Sir David Bruce, who discovered the sleeping sickness germ in 1915.

D'Herelle was born in the province of Quebec, Canada, in the year 1882, and went to France with his family when very young. He took his medical course at the University of Paris. About twenty years ago he commenced work in the Pasteur Institute, and in 1917 made his important discovery of bacteriothage—the parasitic destroyers of harmful bacteria. Three years ago D'Herelle presented an important paper on the subject at a meeting of the Royal Society of Canada. He is now working in Paris.

It is written:

> Big fleas have little fleas
> Upon their backs to bite 'em;
> Little fleas have lesser fleas,
> And so *ad infinitum*.

The curing of the diseases of plants and the elimination of the insect pests that prey upon them has been effected by the use of beneficent parasite enemies for a considerable time, but it seems now that the road is being opened for the cure of human diseases by the same means. To say that D'Herelle's discovery, if scientifically based, is important is to put it mildly. If he is on the right road it is singularly appropriate that his name should be coupled with that of Pasteur.

Some day there may arise a giant among the giants of scientific research who will not only locate the direct causes of cancer and tuberculosis, but the means to overcome them by other natural forces still more powerful. Is it making an overdraft from what remains of the contents of Pandora's box to hope that the day will come when the means will be found to insure immunity from bodily ailments of all kinds?

Killing Russian Literature

LITERATURE is in a bad way in Soviet Russia. An organization of Moscow authors has submitted a memorandum to the Soviet of People's Commissaries drawing attention to the "precarious economic and material conditions in which Russian literary men and women are at present." So bad is the state of affairs, declares the memorandum, that "owing to the impossible material and moral conditions in which the Russian author of today is placed there remains for him but one alternative—suicide."

A list is appended of 300 Russian authors and poets who in the last few years have ended their own lives!

We gather from all this that the golden age of art and literature, as foretold by Lenin and Trotsky, is yet a long way off. On the contrary, "freedom of thought and of the written and printed word has been totally suppressed," and the colossal ignorance of the censors is likely to kill off what remains in the field of letters.

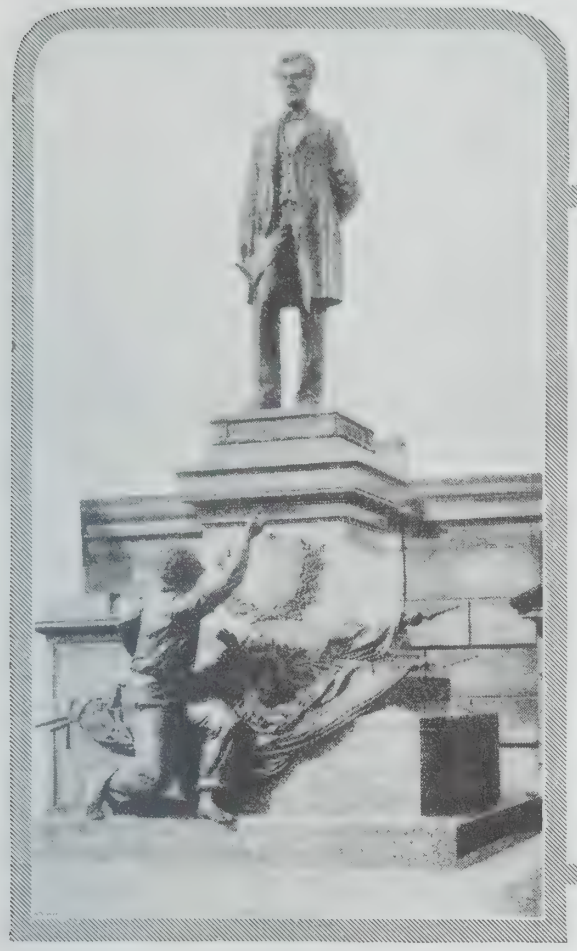
Just what kind of prose or poetry is being turned out by the better class of Russian authors at the present time, or what particular school of art they are following, is not known, but from the nightmareish productions in literature and art which the Soviet of People's Commissaries have allowed to escape within the past few months, we would assume that the retribution of literary insanity has followed upon the crime of suppression.

In a broader view, the question comes, will Russian literature be resurrected into something new and sturdy? The disappearance of the old school with its dark fatalism, its instinctive apprehension of evil, its sense of the uselessness of individual protest and effort, may, in the strange providence of affairs, be a good thing for Russian letters. They perished in the kind of conditions they apotheosized—will those conditions perish with them?

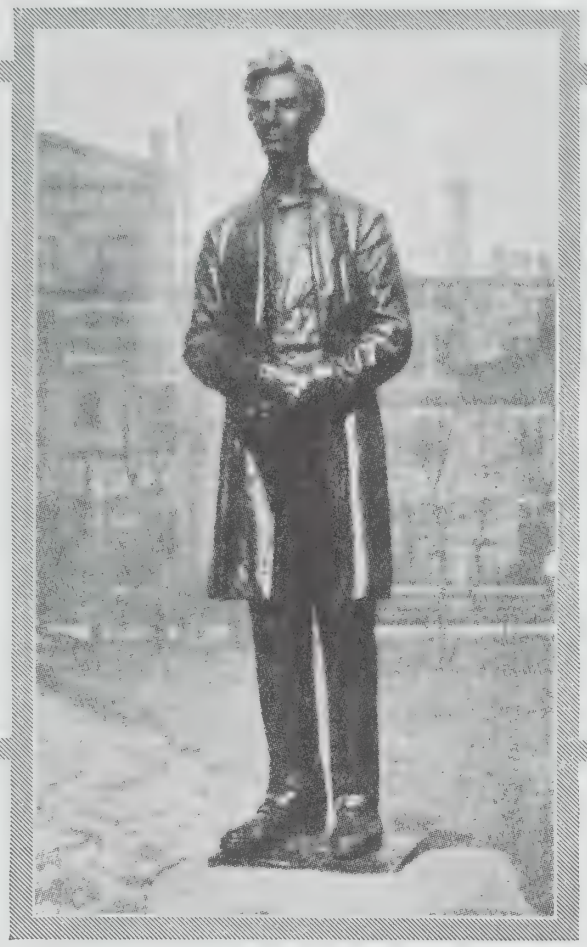
Abraham Lincoln Encircles the Globe

In Stately Works of Bronze and Stone His Genius Is Remembered; From Scotland to Korea Men Have United to Honor His Memory

By LEROY M'GUIRE



The Scottish memorial to Lincoln in Edinburgh.



Right—Barnard's Statue of Lincoln, Manchester, England.

Lincoln, within the shadow of Westminster Abbey, London.

WHAT might well be called "The Lincoln Trail" encircles the globe.

The ideas, ideals and inspiration of the life of Abraham Lincoln have made Lincoln just as much a hero and an ideal to young Korea, and young China as he is to England and America.

The Lincoln shrines in England are numerous and in significant locations. Most prominent is the St. Gaudens statue which stands just opposite Westminster Abbey, and Westminster Abbey is the high altar of the British Empire. Here England's kings have been crowned for many a century, and here their ashes lie.

It is a thrilling experience for an American to come out of this great Abbey, rich with its marbles and memorials; silent with its hallowed history; musty with great age; and run directly into something familiar and sacred to every American heart—the face and form of Lincoln. One enters the Abbey by the west doorways and comes out directly in the path of this Lincoln Memorial. At evening, when this gaunt, but beautiful bronze silhouettes itself against the sunset, the impression is deepened. There in the west, whither the sun hastens, is the land where Lincoln lived and wrought.

The controversy, several years ago, as to whether the St. Gaudens Lincoln or the Barnard Lincoln should grace this spot, was settled by establishing the St. Gaudens Lincoln near the Abbey while the Barnard Lincoln went to Manchester.

An interesting Lincoln Memorial in London is the Lincoln Room in the Savoy Hotel. There is a Lincoln bust with several American historical pictures and the room has been set aside and dedicated as "The Lincoln Room."

Another London Lincoln Memorial is what is called "The Lincoln Tower" of Christ Church, Westminster Bridge Road. Without doubt there is no tower of its kind in any other church on earth, not even in the United States.

Into the stone fabric of this tower, in red, white, and blue stones and tile are worked the stars and stripes, so that, as one comes down Westminster Road one sees, against the sky, the American flag. This sight to a lonely American, wandering in a foreign land, is impressive.

A tablet of bronze under the arch of this great tower bears this memorial statement:

"TO COMMEMORATE EMANCIPATION
BY THE MARTYRED LINCOLN:
AND THE COST OF HALF OF THE TOWER
BY AMERICAN CITIZENS:
AND, AS A PLEDGE OF INTERNATIONAL
BROTHERHOOD!"

This "Lincoln Tower" was erected as a result of a visit of one of the pastors of this church, Dr. Newman, to America. While he was here we were in the midst of the Civil War. He helped to win the friendship of England for America; a friendship that was badly needed at that time. As a result some wealthy men from Philadelphia gave the money to erect this tower in memory of Lincoln. It was dedicated July 9, 1874.

In one of the beautiful libraries of Oxford there is a large bronze memorial to Lincoln with the lettering of the Gettysburg Address set up as the finest example of pure English diction. This, too, is pleasing, that here, in the seat of English learning, the Gettysburg Address should be displayed in enduring bronze.

All over England we find these memorials to Lincoln. Hingham is the little town in which Lincoln's ancestors lived. Here was born Robert Lincoln, who died in 1543. He is the first known ancestor of our great President. This Robert was father to another Robert, who in turn was father to Richard Lincoln. Richard, in his fourth marriage, became father to the line from which Abraham Lincoln sprang. In 1637 this son migrated to America and settled in a new town with the old name—Hingham, Massachusetts. The family later moved to Kentucky whence sprang the man who has made America immortal in the hearts of humanity.

On October, 1919, John W. Davis, then ambassador to Great Britain, unveiled a bust to Lincoln in this little English town.

The inscription reads:

"IN THIS PARISH FOR MANY GENERATIONS
LIVED THE LINCOLNS
ANCESTORS OF THE AMERICAN
ABRAHAM LINCOLN.
TO HIM, GREATEST OF THAT LINEAGE,
MANY CITIZENS OF THE UNITED STATES
HAVE ERECTED THIS MEMORIAL,
IN THE HOPE THAT, FOR ALL AGES,
BETWEEN THAT LAND AND THIS LAND,
AND ALL LANDS, THERE SHALL BE:
'MALICE TOWARD NONE
WITH CHARITY FOR ALL.'"

The Lincoln Memorial at Edinburgh, Scotland, is found in "The Old Carlton Burial Ground," and is a memorial to Scottish-American soldiers who fell in the Civil War:

"Another clasp of loving hands,
Another link across the sea."

This was the first monument erected to Lincoln on European shores. The spot on which it is erected is rich in history. The old burial ground contains a memorial to Mackay, the actor, and the unmarked grave of Willie Nicol, Burns' companion and fellow-lodger. Constable, the publisher of Walter Scott's novels; David Hume, the philosopher; the political martyrs like Muir, Palmer, Skirving, Margarot, and Gerrald, all are buried here. Here also are the graves of Dr. John Brown, author of "Rab and His Friends"; and the parents of Robert Louis Stevenson. In this sacred spot the Scots have placed the Lincoln Memorial.

From Europe the trail of Lincoln leaps to the Oriental world. While there are no material monuments erected to this Occidental in the Oriental world, there is something vastly more enduring: the political ideals of Lincoln have somehow reached the souls of the Orientals.

When I visited Korea during the days of the great Independence Movement, I heard educated Korean boys continually speaking of "Leen-koln." It was a beautiful thing to hear these boys pronounce that name. "He is our Leen-koln as well as yours!" said one of the American-educated Korean leaders.

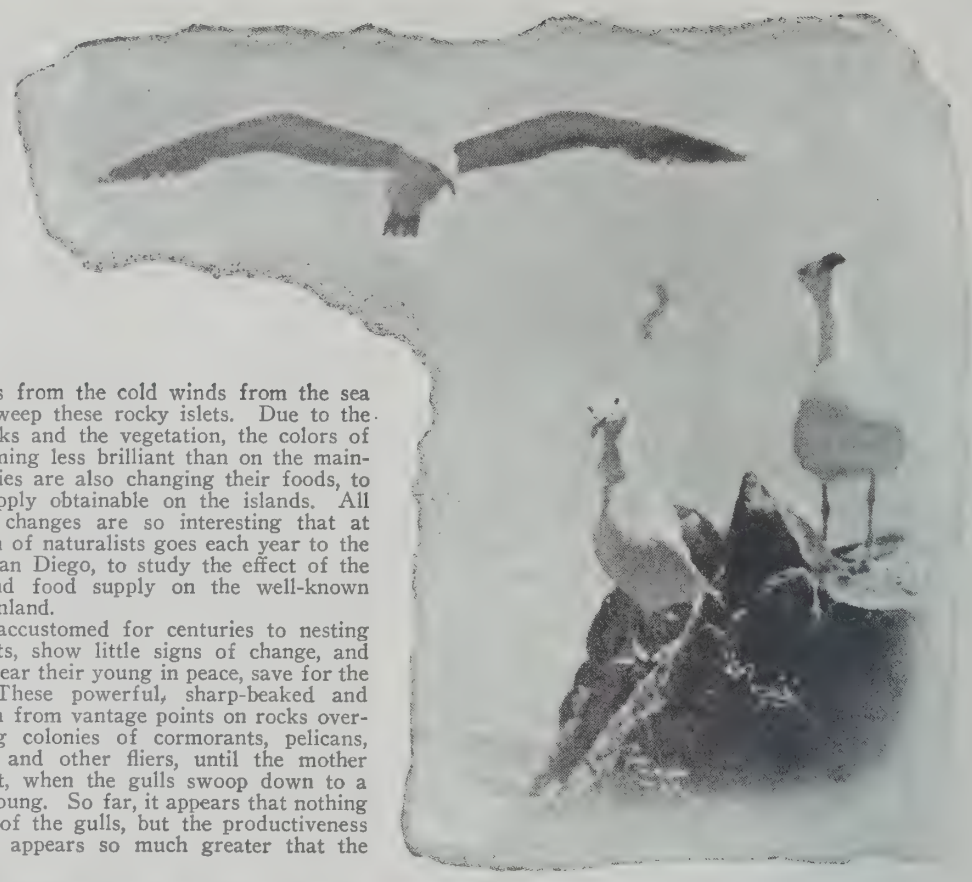
I found the same thing true in China among the "Young Chinese Student" group. This group is being led by boys educated in American schools and the name of Lincoln is as familiar to them as the name of Dr. Sun Yat Sen. It was a stirring thing for an American to stand on the streets of Pekin, in the midst of a great mass student meeting, and to hear one word—and one word only—that could be understood. That word came with machine-gun-like regularity and explosiveness, from the impassioned lips of a Chinese student who was exhorting his friends to a deeper patriotism for their nation. It was in the midst of those crucial days when Japan was trying to get a strangle hold on the Pekin government; and the Student's Boycott Movement was menacing the commercial dreams of Japan in China. These great mass meetings under the auspices of the students were the largest and most impassioned meetings I ever attended. I would listen for an hour to a Chinese orator and not understand his language but now and then the name "Lincoln" was spoken and, the way that boy-patriot spoke that name was almost like some great "Amen" on human lips.

I found the same spirit in the Philippines. Young Filipinos, in oratory and song, use more often the name of Lincoln than they do that of Jose Rizal, their own martyred patriot. Americans have left the name of Lincoln buried deep in the hearts of the educated Filipinos and their patriots, without exception, use the sayings of Lincoln in their own fight for independence.

So the Lincoln Trail, as it might be called, starts in that little, obscure town of Hodgensville, Kentucky; and runs from there into Illinois, Salem, Springfield; and from there to Washington, D. C., and back to Springfield again, where Lincoln is buried; and then it starts out again to be a world trail. It leaps to the shores of Europe, and thence to the Oriental world; until it literally encircles the globe.

Winged Kings of the Coronados

By HARRY H. DUNN



The kings of the Coronados, sea gulls watching from a lofty peak for any one of the nesting cormorants or other birds to leave their nests, so that these monarchs of the air may make a feast of the eggs or young birds.

NEVER connected with the mainland, though only seven miles from the coast line, and thus true oceanic islands, five rocky projections from the sea just south of the southern boundary of California form one of the most interesting of the so-called "desert island groups" in the world. In fact, they were first called, when they were discovered by Juan Rodriguez Cabrillo, on September 26, 1542, "Las Islas Desiertas," but they since have become the Coronados Islands. The source of the name is not well known, nor is the reason for applying it. Possibly these barren islets were so called because three of them resemble remotely crowns rising from the deep; possibly in honor of the Spanish adventurer-explorer, Coronado; and possibly as a tribute to the crowned heads of Ferdinand and Isabel.

In any event, so far as geographers, ethnologists and fishermen who visit them occasionally know, this is one of the few groups of islands in the world which never have been inhabited by Indians. Farther north, the mainland tribesmen of early California passed freely between the coast and the Channel Islands, now known as Catalina, Santa Barbara, San Miguel, San Clemente, Anacapa, and so on. Today, as in all time past, according to the naturalists and the geologists, all the abundant life which exists on the Coronados passed to them either through the air or through the water. For these reasons, birds dominate the rocks themselves, and sea lions the shore, while at one time the magnificent sea otter, now almost extinct, slept in peace on his piled bed of kelp leaves above ten fathoms of water, or slid in play up and down the steep banks of the islands. Once, too, the elephant seal was here, but today the last herd of these weird animals to be found in the Northern Hemisphere is being given protection, of a sort, on Guadalupe (Wah-dah-loo-pay) Island, by the Mexican Government.

The Coronados always have been the property of the birds and the sea mammals, particularly the sea lions, from whose herds come the trained "seals" with which we are familiar in circuses and on vaudeville stages. Once, though, the fur seal played around the Coronados, but, like the otter and the sea elephant, he fell before the rifles and clubs of the fur and oil hunters of half a century or more ago. Today the birds on the five islands first seen by Cabrillo of all white men have built up an empire of their own, a limited monarchy, of which the great gulls are the kings and queens. Even the huge-billed pelicans, the swift-winged terns, and the noisy cormorants pay tribute to these rulers in the shape of eggs and young birds, and the osprey, whose means of getting a livelihood is to take it by force from some better fisherman, avoids and evades the gulls, while Madame Osprey hugs her nest in fear that, if she leave it, her beautiful eggs will feed some wandering pirate of the air.

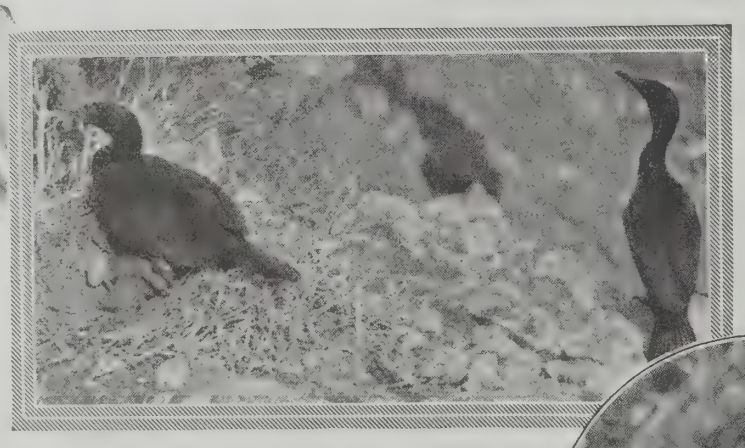
Above—Young sea lions which never have been annoyed by man are as tame as puppies. Here is a group of them, sunning themselves on one of the upthrust ledges of the largest island of the Coronados. They are friendly little creatures and at this age do not fear the men who are invading their haunts.

At left—He looks as if he might be a left-over from the days of dinosaurs and pterodactyls, but, as a matter of fact, he is merely a young pelican, considering his world from a high rock on one of the Coronados Islands. From this vantage point he can view the heavy swells which often produce a high surf on the leeward shores of the island.

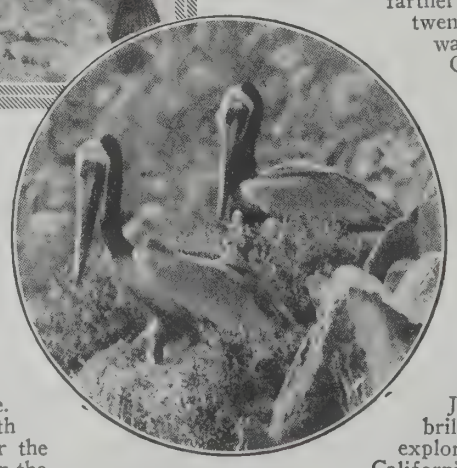
There is only enough water on the Coronados for the birds, but on other islands along the coast of Lower California, where goats have been introduced, these animals have learned to slake their thirst sparingly with salt water, and so have survived and increased where there is not sufficient fresh water in the seepage springs to support animal life. On other islands, too, house-cats have been brought from the mainland and released. These have increased until they are destroying rapidly all the bird life, both by catching the smaller land birds and by eating the eggs and young of the sea birds. There is little hope, on these other islands, of preserving the birds, while the goats are destroying all the vegetation. But on the Coronados, where the gulls dominate the avian settlement, there are neither goats nor cats, and the islands form literal "cities of refuge" for all varieties of birds.

Here on the Coronados, too, an interesting evolutionary process is being worked out before the eyes of students. Birds from the mainland, such as finches, sparrows, warblers, wrens, and other small fliers, which have come from the Lower California shore and settled permanently on these islands, are slowly changing the colors of their plumage and the thickness of their feathering to conform to climatic and soil conditions there. On some of the land birds the plumage is nearly twice as thick as it is on the same varieties on shore; this is to protect the birds from the cold winds from the sea which constantly sweep these rocky islets. Due to the dullness of the rocks and the vegetation, the colors of the birds are becoming less brilliant than on the mainland. These varieties are also changing their foods, to conform to the supply obtainable on the islands. All these evolutionary changes are so interesting that at least one expedition of naturalists goes each year to the Coronados, from San Diego, to study the effect of the isolated climate and food supply on the well-known birds from the mainland.

The sea birds, accustomed for centuries to nesting on such rocky islets, show little signs of change, and here they nest and rear their young in peace, save for the dominant gulls. These powerful, sharp-beaked and fearless birds watch from vantage points on rocks overlooking the nesting colonies of cormorants, pelicans, shearwaters, terns, and other fliers, until the mother bird leaves the nest, when the gulls swoop down to a feast on eggs and young. So far, it appears that nothing preys on the nests of the gulls, but the productiveness of the other birds appears so much greater that the balance of nature apparently is unchanged. This maintenance of equality of numbers in spite of the check given by the gulls furnishes another interesting biological lesson on the Coronados.



Above—Father Coromorant watches, while mother covers the eggs and naked young in the nest. Both of them are the most noted fishermen of the avian world. At right—Like Greek philosophers, pondering the futility of life on an isolated island, the pelicans sit on their nests on the Coronados, undisturbed by the approach of men and cameras.



There are five of these islets, rocky and desolate. To ships coming toward San Diego from the south and southwest, they furnish the first landfall for the entrance to that port, backed by Table Mountain on the mainland, and by lofty Point Loma at the western side of the entrance to the Bay of Saint James. There are two main islands, and three smaller masses of rock, two of which are virtually unapproachable without ropes and scaling ladders. The largest island is about seven miles from the Lower California shore, and the others stretch northward for a distance of four or five miles. This largest island, which has no name, is two miles long and one-half mile wide, wedge-shaped, and rising to a height of 674 feet at the highest point. There is much low vegetation, and a very few shrubs of larger size which might be called trees. All the islands are uplifted stratified rocks, their sea-sides filled with caves hollowed by the pounding surf of centuries, and through which today the sea moves with a ceaseless, almost deafening roar.

To the west and northwest of this largest island lie two sugar-loaf rocks, rising about fifty feet from the surface of the sea, with deep water all around them. In fact, the whole group of islands is surrounded by unusually deep water, bottom being farther down than around almost any other small islands on the Pacific Coast of North America. The other large islet is about three-quarters of a mile long by a quarter of a mile wide, and rises to a height of 350 feet. There is a fair anchorage on the eastern side of this island, a little north of the middle, with eight fathoms (48 feet) of water, over a hard, sandy bottom. The fifth of the Coronados is merely a rocky point rising from the sea to a height of 40 or 50 feet, with not even enough beach to make resting places for the sea lions which are found on the two larger islets.

More is known about the discovery of these islands than about the islands themselves, though the various expeditions sent to them have failed to find any trace of prehistoric man, or even of modern Indians, on them. Just why the Indians, once plentiful around San Diego Bay and farther south on the Lower California coast, never crossed to these islets is something of a mystery though probably they did cross, and, finding insufficient fresh water, returned to the mainland. The seven miles of water separating Lower California from the islands would have offered no obstacle to these Indians, whose fellow tribesmen, somewhat farther north, crossed twenty to thirty miles of water to reach the Channel Islands, and, in addition, found this channel, then as today, one of the roughest bits of water on the entire Pacific Coast.

The finding of the Coronados was due to the sending out, in 1542, by Antonio de Mendoza, viceroy of Mexico, of an expedition under Juan Rodriguez Cabrillo, a Portuguese, to explore the coast of the Californias in an effort to find a way to the Indies. Cabrillo, with two small ships, the second of which was commanded by Bartoleme Ferrer, or Ferrelo, and numbering in his

What "The Mark of the Scalpel" Tells

Thrilling Episode Connected With the Assassination of Lincoln

By CARSON C. HATHAWAY

HIDDEN away under lock and key in the Manuscript Division of the Library of Congress is a little thirty-one-page document, written in longhand, recounting one of the most amazing stories in American history. Its human interest does not rest in the fact that the narrator was a famous surgeon, although his career was a distinguished one. It comes from his association with the greatest tragedy in American annals—the assassination of Abraham Lincoln.

The writer was John Frederick May, who was born in Washington, D. C., in 1812 and died there in 1891. Many years after the Civil War he wrote out a statement which he called by the strange title, "The Mark of the Scalpel." His account was called forth by the endless public questioning as to whether John Wilkes Booth had actually been killed.

The account which follows is based on Dr. May's own graphic description given in the yellowed document which has found its way into the collection of Lincoln manuscripts in America's greatest library. He recalls a scene that took place in his Washington office not long before the assassination of the President:

"A fashionably dressed and remarkably handsome young man, accompanied by a friend, entered my office in Washington and introduced himself to me as Mr. Booth. After some ordinary conversation, he told me he was playing an engagement with Miss Charlotte Cushman and was much annoyed by a large lump on the back of his neck, which for some time past had been gradually increasing in size and had begun to show above the collar line. He said he wished to have it removed and he particularly enjoined me to say that it was for the removal of a bullet from his neck.

"Without promising to observe this injunction, I examined his neck and found on the back of it and rather on the left side quite a large fibroid tumor, but which could have no connection with a bullet as to its origin or in any other way. I advised its removal but at the same time told him I would take it out on one condition, which was that he should suspend his engagement at the theatre and observe absolute rest. He replied he did not wish to do this; in fact, he could not."

It should be remembered that Booth was a familiar figure in the theatrical world. He played, in fact, upon the very stage which was later to witness the historic tragedy. On March 18, 1865, for example, Ford's Theater carried a prominent advertisement in the Washington papers that, "This evening Mr. John Wilkes' Booth has kindly volunteered his valuable services."

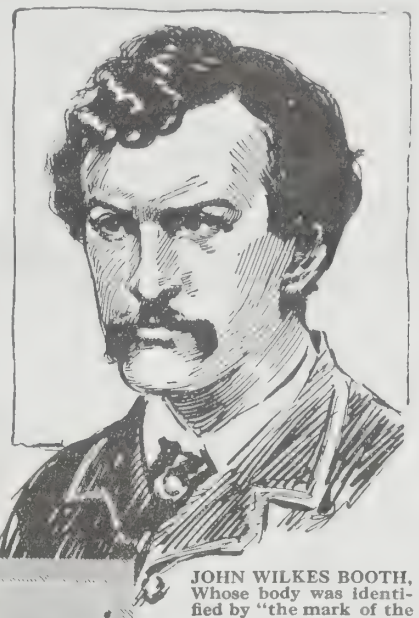
"I then explained to him the importance of his remaining quiet after such an operation on the ground of his personal appearance—that there were two principal ways by which a wound made by a surgical operation healed. The first, by primary adhesion, by which, if the edges were brought closely together and kept in contact for some little time, they became directly united and left so fine a scar as scarcely to be noticed; but that this bond of union, though daily becoming stronger, was weak for some days after the adhesion and could easily be broken by undue violence and if once broken the wound would gape and its edges not be likely to reunite and then the space between the wound would have to fill up with new tissue or flesh and an ugly scar would be left."

But Booth would not consent to taking any rest. He would only promise to take great care not to disturb the wound. Finally, Dr. May agreed to perform the operation. For a time it seemed to be healing rapidly.

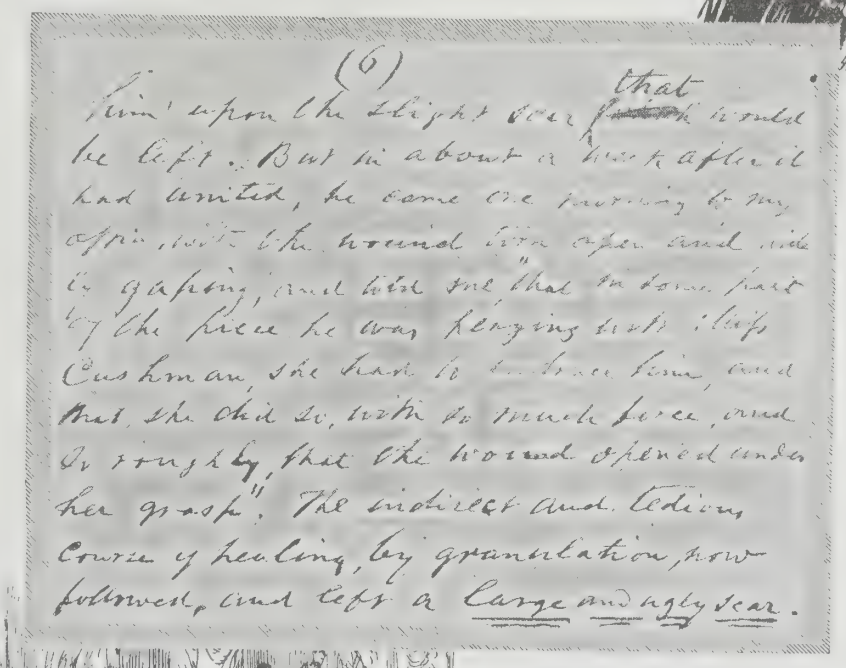
"But in about a week after it had united, he came one morning to my office, with the wound torn open and widely gaping, and told me 'that in some part of the piece he was playing with Miss Cushman, she had to embrace him, and that she did so, with so much force and so roughly that the wound opened under her grasp.' The indirect and tedious course of healing, by granulation, now followed and left a *large and ugly scar.*"

Booth did not return to Dr. May's office again. On April 14, 1865, came the assassination. The storm of bitter public condemnation for the deed was accompanied by deep regret that the murderer's brother, Edwin Booth, the distinguished actor, should be innocently involved by his family connection in the tragedy. One newspaper of the day told of this incident:

"Not a month since, Mr. Edwin Booth was proceeding to Washington. At Trenton there was a general scramble to reach the cars which had started, leaving many behind in the refreshment saloon. Mr. Edwin Booth was preceded by a gentleman whose foot slipped as he was stepping upon the platform and who would have fallen at once between the wheels had not Mr. Edwin Booth's arm sustained him. The gentleman remarked that he had had a narrow escape of his life. It was Robert Lincoln, son of that great, good man whose name we cannot mention without choking."



JOHN WILKES BOOTH, Whose body was identified by "the mark of the scalpel."



(6)
him upon the slight scar that would be left. But in about a week after it had united, he came one morning to my office with the wound torn open and gaping, and told me that in some part of the piece he was playing with Miss Cushman, she had to embrace him, and that she did so, with so much force, and so roughly, that the wound opened under her grasp". The indirect and tedious course of healing, by granulation, now followed, and left a large and ugly scar.

A dramatic page from "The Mark of the Scalpel." This old manuscript in the Library of Congress tells the story of the identification of John Wilkes Booth.

Ford's Theater in Washington as it looks today. Here Abraham Lincoln was assassinated in 1865.

"But never in a human being had a greater change taken place from the man whom I had seen in the vigor of life and health as in that of the haggard corpse which was before me in its yellow and discolored skin, its unkempt and matted hair and its whole facial expression sunken and sharpened by the exposure and starvation it had undergone. The doubt expressed need cause no surprise, for on the body produced by his captors nearly every vestige of resemblance to the living man had disappeared.

"But the mark made by the scalpel during life remained indelible in death and settled beyond all question at the time and all cavil in the future the identity of the man who had assassinated the President."

The newspapers of the time carried this simple notice:

"The body of Booth has just been formally identified by prominent surgeons. From long exposure it has changed very much. A surgical operation performed on him several weeks ago rendered identification easy."

That was all! Thus was the public informed of "The Mark of the Scalpel."

And what manner of man was it that killed the President? Dr. May recalls in his manuscript that Booth often became madly excited in his parts on the stage. In his fencing scenes, he became actually a source of danger to his fellow actors. Nor was his conduct at the scene of the assassination that of a normal man.

"He was an actor and consequently could have disguised himself by a knowledge which was part of his art so thoroughly that no one could possibly have known him. Did he do this? No: but publicly, in the sight of everyone and without the slightest attempt at concealment, he fired the fatal shot and as if glorying in the act and shouting the well-known motto of Virginia, he sprang from the box in which he committed the deed upon the stage, breaking his leg, but yet facing the au-

(*Concluded on page 15*)

In a few minutes he was dying, with the words on his lips, "Tell mother I died for my country. I thought I did it for the best."

What a contrast between his stage triumphs and his return to Washington! Never had there been a more melancholy journey.

"They sewed him up in a saddle blanket. A venerable old Negro living in the vicinity had the misfortune to possess a horse. To this was harnessed a very shaky and absurd wagon. It had no tailboard and its shafts were as sharp as famine. Into this mimicry of a vehicle the murderer was to be sent to the Potomac River. The corpse was tied with ropes around the legs and made fast to the wagon sides. When the wagon started, Booth's wound, till now scarcely dribbling, began to run anew. The blood fell through the crack of the wagon dripping upon the axle and spotting the road. It stained the planks and soaked the blankets. Finally the old Negro was dismissed, the dead man untied and cast upon the vessel's deck, steam gotten up in a little while and the broad Potomac shores saw this skeleton ship float by, as the bloody sun threw gashes and blots of unhealthy light along the silver surface."

The public at once pointed out that it was necessary to establish the fact that the body which had been brought down the Potomac to the Navy Yard at Washington was beyond doubt that of Booth. Dr. May was thereupon summoned to identify the body. Being very busy, he did not at first answer the call. A more peremptory message was sent to him. He then started for the Navy Yard, accompanied by his little son. On the way he met a third messenger, this time the chief of the detective corps himself.

"The body was on deck, completely concealed by a tarpaulin cover and Surgeon-General Barnes and his assistants standing near it. By his order the cover was removed and to my great astonishment revealed a body in whose lineaments there was to me no resemblance to the man I had known in life. My surprise was so great, I at once said to General Barnes, 'There is no resemblance in that corpse to Booth nor can I believe it to be that of him.' After looking at it for a few moments I asked, 'Is there a scar upon the back of its neck?'

"He replied, 'There is.'

"I then said, 'If that *is* the body of Booth, let me describe the scar before it is seen by me,' and did so as to its position, its size and general appearance so accurately as to cause him to say, 'You have described the scar as well as if you were looking at it.'

"*The body being then turned, the back of the neck was examined and my mark was unmistakably found by me upon it.*"

After a considerable time, Dr. May was at last able to recognize the features of the assassin.

Lincoln's Secretary Talks of His Chief

Says the Great Emancipator Was Governed By His Inner Life Which But Few People Saw

By DIRK P. DE YOUNG

SHORTLY after his election to the Presidency, in 1860, Abraham Lincoln asked William O. Stoddard, now a ninety-year-old patriarch of Madison, New Jersey, what he might be able to do for him. Mr. Stoddard, then the young editor of the Illinois Central *Gazette*, at Champaign, Illinois, replied that he was well fixed and wanted nothing. Lincoln urged the young man, however, and he finally replied:

"Nothing can tempt me to go to Washington unless it be a place on your staff."

"Put that in writing," was the Great Emancipator's quick response, and the man who is still living, with his mind as clear as a bell, became the secretary to the President who freed the slaves and saved the Union.

Regarding Abraham Lincoln himself, the years have not faded out the favorable impression which this secretary received of his chief. On the contrary, the image of the man in perspective is much greater to Mr. Stoddard than the form of the Emancipator in the flesh. It was the "Inner Lincoln" which he knew, the spiritual side of the great President, the periods when he saw him wrestling with himself and with his God, for a solution of the problems which beset the path of the nation, instead of the "Outer Lincoln" with his dry humor and his "public front." Lincoln's unusual sense of humor, this living secretary of his says, merely balanced the unusual depth of his pathos.

Lincoln's feeling of gratitude toward Mr. Stoddard arose from the following editorial, which appeared in the Illinois Central *Gazette* in 1859, reprinted in more than 200 newspapers throughout the United States shortly after, originating The Rail-splitter's presidential boom:

"OUR NEXT PRESIDENT: We had the pleasure of introducing to the hospitalities of our Sanctum, a few days ago, the Hon. Abraham Lincoln. Few men can make an hour pass away more agreeably. We do not pretend to know whether Mr. Lincoln will ever condescend to occupy the White House or not, but if he should, it is a comfort to know that he has established himself for a character and reputation of sufficient strength and purity to withstand the disreputable and corrupting influences of even that locality. No man in the West at the present time occupies a more enviable position before the people or stands a better chance for obtaining a high position among those to whose guidance our ship of state is to be intrusted."

Mr. Stoddard was born at Homer, Cortland County, New York, in the year 1835. At the Syracuse Academy he studied under Professor Hoyt, where with him a remarkable group of boys was gathered—boys who later became lawyers, judges, generals, ministers, authors and successful men of business, the most noted of them all the late Andrew D. White, educator and diplomat, who was a warm personal friend of Mr. Stoddard to the end of his life. From his school work he drifted out to the great West in the late fifties, following a journalistic career. For a time he was editor of the Chicago *Ledger*. Then followed the Panic of 1857 which swept away the *Ledger*. Mr. Stoddard then took up four hundred acres of prairie land in Champaign County, Illinois. The romance of frontier life captivated him, during which period he encountered the perils of being nearly frozen to death, burned by prairie fire, poisoned by rattlesnakes and swallowed by quicksand.

After those experiences he became the managing editor of the Illinois Central *Gazette* at Champaign, which was at the time of the birth of the Republican party. Abraham Lincoln, then ex-Congressman from Illinois, and a leading lawyer of Champaign County, was attracted by the editorials and called to see the editor. That was sixty-five years ago. But Mr. Stoddard, who occupied an armchair by the window in his son's home in the Oranges, when I called to see him, looking out over the trees with their falling leaves on that sunny October morning, recalled the incident as clearly as if it had happened only yesterday.

"We ran the newspaper on the upper floor of a building," this interesting old gentleman, who had actually lived a great history himself, began. "I had a physician as a partner and he occupied the first floor as his office. We had a good newspaper, with the largest circulation of any journal in that part of the state, but we operated the printshop on a small scale.

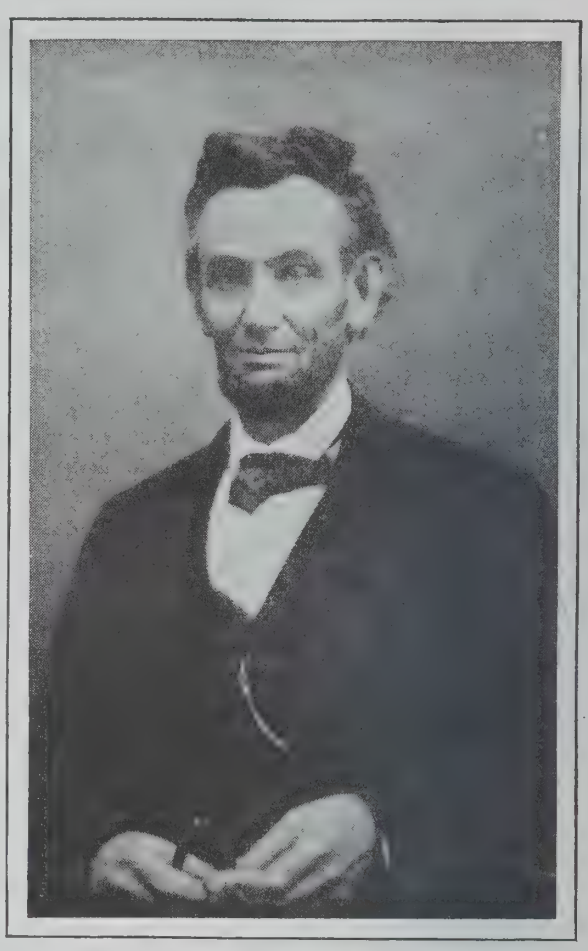
"One day I was engaged in the pressroom, pretty well besmeared with ink. In came my partner, who had just been rolling pills downstairs, to tell me that Abraham Lincoln wanted to see me. I told the doctor that I would not roll down my sleeves to go to see him, but would compromise by washing my hands and meeting him as I was to discuss the organization of the Republican party.

"It was not the first time I had seen Lincoln, of course. But it was the first time I had met him to talk to him. I went over to the old hotel across the street from our office, where he stopped. When I walked into the room with its old-fashioned bar at one end and a big roaring stove at the other, Lincoln sat there in a battered armchair. Off came his tremendous hat, which was filled with letters that he proceeded to read. Coming to one written by Solomon P. Chase, his face lighted up as if from an internal fire.

"I have always been a close student of men. I carefully observed Lincoln that day. Thus when I went back to my partner, who was still busy rolling pills, I told him I had made up my mind who was going to be the next President of the United States. I then wrote the editorial in question which immediately caused a storm of comment. Answers came to it from all over the country. Hundreds of extra copies of it were struck off, and Lincoln was in due course elected President."

About December 1, 1860, Mr. Lincoln directed Mr. Stoddard to wind up his affairs in Illinois and go to Washington to await his arrival. He was then twenty-five years of age. Directly after the President's inauguration, he was appointed secretary to sign land patents. The Executive Office was then not so well organized, of course, as it is today, three young men, under different appointments, actually performing the secretarial duties of Mr. Lincoln.

The clerical duties of the White House before 1860 were comparatively few, and there was no existing law under which the force could be increased. The President of the United States was then allowed but one "private secretary" as such, on a very modest salary. Thus to the office of "private secretary" he appointed John G. Nicolay, who had already served him in that capacity. Needing more help, John Hay was made a second secretary, by appointing him a clerk in a department, "assigned to duty" at the White House, a custom which is still in vogue in Washington.



One of the best of the Lincoln portraits. Print from an old glass plate taken by Alexander Gardner at Washington the day of Lee's surrender.

A little later, Mr. Stoddard, who had already been appointed the President's secretary to sign land patents made the third of the Great Emancipator's confidential assistants during the Civil War period. And he is the only one of the three now living, a trio of secretaries which comprised the entire White House force during the earlier and stormier days of the Lincoln Administration. Mr. Stoddard says that these young men became intimate friends and saw Lincoln as few others ever saw him during the periods of storm and stress, when the nation's life, with the tall figure of the immortal President constantly bending over its sick-bed, hung depressingly in the balance.

In the early months of the year 1861, as the war cloud darkened, a company of Rifles was formed for the home protection of Washington, which lay almost helpless between two seemingly disloyal states—Virginia and Maryland. Mr. Stoddard was the first to join Company A of the Rifles, with Lincoln's permission—the first company organized for the Civil War. That company did gallant duty under Major Smead, bearing the brunt of the defense of Washington until the arrival of the New York Seventh Regiment and the Massachusetts Sixth. During the three months' duty they guarded the Potomac bridge and captured the first vessel in the war, the *St. Nicholas*, a steamer from Alexandria full of Secessionists. After the three months' service he returned to his desk at the White House and took charge of the President's mail which was voluminous. He also attended Mrs. Lincoln's correspondence, saving both of them, he says, from a flood of vituperation from a misunderstanding country. Mr. Stoddard's office was the room in the northeast corner of the White House on the second floor. The latchkey, with which for many years he opened the front door of the White House, he retained as a relic.

"In handling the White House mail," this interesting man of four-

Wide World Photo.

Our photo shows William O. Stoddard, 89 years old, once the secretary of President Lincoln, as he looked while he was at ease in his home in Madison, New Jersey. Mr. Stoddard, despite his age, takes an active interest in present-day politics and has been quoted to the effect that "The late President Wilson had much the same spiritual life as Lincoln, making him capable of great things." Mr. Stoddard wrote the first editorial upon the nomination of Lincoln which appeared in the Illinois Central *Gazette*, May, 1859. Mr. Stoddard was Secretary to Lincoln from 1861 to 1864. Inset— A photo of William O. Stoddard, at the time he was secretary to Lincoln.

Soccer May Be King Sport

Association Football Catches American Fancy

By PAUL MACDONALD

A NOTICEABLE feature of sports in the United States is the growth of soccer. Introduced a comparatively short time ago, the game has caught the American fancy and promises to become a major sport in this country.

Soccer is a major sport in Great Britain and has been for years. It is also a major sport in Germany, France, Italy, Norway, Sweden, Belgium, and Denmark. Over there the game is known as Association Football.

A team consists of eleven players, as in intercollegiate football in this country. There is a goalkeeper, two fullbacks, three halfbacks and five forwards. The only player permitted to handle the ball is the goalkeeper and he can do so only in a restricted area, known as the penalty area, which extends eighteen yards from each goal. The other players have to place the ball between the posts, either by kicking it or butting it with their heads.

In Great Britain first-class teams attract an average crowd of 30,000 spectators. The professional players receive a salary of $35 a week and they are also given the proceeds of a benefit game after serving a certain time with their clubs. This nets them usually about $2,500. An international player receives $45 for every international game in which he participates. Association Football players are sold the same as baseball players in this country. The highest price ever paid for one was $25,000. The player received a portion of the price. In this country $25,000 is a small price for a ball player and only in rare instances does any of the money go to the player.

The career of an Association Football player is a bit longer than that of a ball player in the United States. A typical player is R. Crompton of the Blackburn Rovers, of England. He played in seventeen international games, covering a period of twelve years.

The World War did much for soccer on both sides of the trenches. It became a favored pastime with the fighting nations.

Soccer has drawn far greater crowds than any game in the United States. The record attendance is 170,586, made at the English cup final at Wembley Stadium, London, in 1923. The record crowd for the European continent is 70,000, which attended the game between Germany and Austria, played at Vienna, in 1922. Germany won by a 2 to 0 score.

In 1915 the United States sent a representative soccer team overseas. This eleven played Norway to a 1 to 1 tie and defeated Sweden 3 to 2. The team was not so successful in Great Britain.

America is to invade European shores again this year. The result should be more favorable to the United States. We have learned much about soccer since 1915 and are fast developing some excellent players.

* * *

Baseball is played in Sweden but scoring of the game in Sweden is considerably different from our own. What we score a fielder's choice is scored a hit in Sweden and no record is made in the score books of flies and sacrifice flies. Catchers are charged with errors on passed balls and pitchers are charged with errors on wild pitches. Every trip to the plate is counted as a time at bat, regardless of whether the batter hits safely, is retired on a batted ball, struck out, walked, or hit by a batted ball. All strikeouts are credited to the pitcher.

We keep a separate column for passed balls and wild pitches. They are charged as such but considered errors. The Swedes have simplified the matter and sooner or later we may do the same thing in this country. Since passed balls and wild pitches are considered errors by us why not charge them as such and eliminate the extra columns. And, there are many in the United States who believe that a strikeout should be credited as an out for the pitcher. But, since the pitcher is credited with a strikeout he can afford to let the catcher have the putout since the catcher has the fielding chance that retires the batter and the pitcher's part in a strikeout really furnishes an assist.

* * *

William T. Tilden is unquestionably the best tennis player this country has produced. During the winter of 1922-23 there was published a book on tennis by Tilden and in this book he predicted that Miss Helen Wills, the California net star, might be a champion at some future time but that she could not hope to gain the title before 1927. Also, Tilden asserted in his book that Mrs. Molla Bjurstedt Mallory was the world's greatest tennis player.

In less than nine months Tilden was proved wrong twice. Miss Wills not alone won the national championship but she easily defeated Mrs. Mallory in winning it and Mrs. Mallory, previous to her defeat at the racquet of Miss Wills, had lost to Mlle. Suzanne Lenglen, the brilliant French woman, and to Miss Katherine McKane, the English player. Our greatest performers often lose much prestige when they step out of their customary rôles to become prophets of their favorite sport.

Miss Wills' ascendancy was a matter of mental attitude. She had the ability. That much she proved on the eastern courts during the previous season. It was a question whether the girl could bring herself to believe in her own ability. But, when she defeated Miss McKane, who had previously beaten Mrs. Mallory, she decided that she certainly should also be able to defeat Mrs. Mallory. And she did. In her match with Mrs. Mallory she possessed a poise that she had lacked previously. Confidence developed this poise. And, without this confidence and resultant poise, none can ever succeed in athletics. The victory of Miss Wills in the Olympic Games and the American championships in 1924 proved that further.

* * *

You often read that ball players never hear the remarks of the bleachers; that they are deaf to the abusive remarks of hostile spectators; that it concerns them no more than the din of the foundry does the iron moulder. But, those that say that are mistaken.

More pitchers have been beaten by the raucous "Take him out" chorus of the grandstand and bleachers than by a lack of ability. More aspiring recruits have been turned back from the majors because an excusable error that proved costly to the home team brought on the ire of the mob, than through most other causes.

The ball player expects the abuse; it is part of the game. But it cuts him just the same. He does not seem to mind but that attitude is developed by him just as that of the boxer who always smiles when his opponent's punches hurt him most of all. It is a false bravado, meant to disarm an opponent.

Several years ago the Brooklyn baseball followers decided that Ivan Olson, then playing shortstop for Brooklyn, was not good enough for the team. They demanded the club secure a new player for short. Each day they abused Olson and Olson finally stuffed cotton into his ears so that he could not hear the insults. Then he hit upon the plan of letting strands of cotton dangle from his ears so that his persecutors would be aware of the presence of the cotton. The sight of Olson, running after batted balls, strands of cotton streaming from his ears, proved too much. His pursuers capitulated. They had to laugh and surrender. Olson continued playing the position.

Boxers, like ball players, pretend not to hear the jibes of the mob. But they do. Eugene Criqui, French hero of the late war, defeated Johnny Kilbane for the featherweight title. Soon after he fought Johnny Dundee, defending his newly won crown. The New York crowd that was packed around the arena began abusing Criqui as soon as he appeared in the ring and continued insulting and abusing him until the fight ended. Criqui took a terrible beating from Dundee. He lost the fight and the title. Several months later, back in France, Criqui announced his retirement. He turned down several flattering offers for bouts with the explanation that the jeers of the crowd when he lost to Johnny Dundee in New York finished him.

* * *

R. H. Rawson of the West Bowling Golf Club, England, will dispute with anyone claiming the title of England's most enthusiastic golfer. Rawson should be awarded the championship; he deserves it. In 1920 he pla·ed 374 rounds of golf. He played 443 rounds in 1921 and in 1922 he had 294 rounds. He kept a careful record of every round he played. And he set a mark that any golfer can shoot at, especially his high record of 1921.

* * *

Baseball teams paying fortunes for a talent and greater fortunes in salaries, take practically no measure to protect this human property. There is not one major league team that employs a trainer with talent and experience.

Even minor colleges pay good salaries for men whose sole duty it is to look after the physical condition of the students who engage in athletics. At the larger colleges and universities there is a staff of highly trained experts whose job it is to see that men are physically fit for competition. The least pain or injury immediately receives attention from men that know their business.

In baseball the trainer receives a small salary and he is a trainer in name only. Generally the trainer of a major league team is nothing more than a valet and baggage boy. He has little knowledge of the human body.

Baseball stars, secured for enormous prices and paid enormous prices in salaries because of their individual drawing power, are out of the lineup for days at a time, quite often, through some minor injury which, if given expert treatment at its inception, would have permitted the player to continue in the game. Absence of such a star costs baseball clubs a great deal of money annually and this could have been saved by the employment of an efficient trainer. Still, major league teams have continued season after season, refusing to recognize this fact.

* * *

The South Sea Islands have set a record in cricket that will probably never be equaled. When the game was introduced on the islands there were 300 players on each side and a match lasted three weeks, as a rule. The result of this extended play caused the fishing and agricultural interests and the civil service to become demoralized. Finally a royal edict was issued limiting the number of players to 70 on each side and with only 140 men participating, instead of 600. The time required to play a match has been cut to from five days to one week.

* * *

Denton T. (Cy) Young was a master pitcher in 1904, probably the greatest of his day. He drew a salary of $4,500 that season. In 1914, ten years later, Christopher Mathewson was in his prime, a great star and national idol. Mathewson's salary was $12,500. George Herman (Babe) Ruth, is now the leading attraction of baseball and Ruth's salary is $52,000 for 1925. While you are pondering over the fact that times change, consider these figures, touching on periods ten years apart.

An Interview With Springfield, Illinois

Concluded from page 4

also is one of the historic spots to which this thriving city lays claim.

To one who knows America, Springfield suggests Lincoln, Vachel Lindsay, Edgar Lee Masters, Dr. Frank Crane and Brand Whitlock. Doubtless in recent years none think of Springfield without remembering Lindsay's poem: "Lincoln Walks at Midnight," which I have received permission to quote in this article because it is distinctly of the fiber and soul of Springfield:

LINCOLN WALKS AT MIDNIGHT*

(In Springfield Illinois)

It is portentous, and a thing of state
That here at midnight, in our little town
A mourning figure walks, and will not rest,
Near the old court-house pacing up and down,

Or by his homestead, or in shadowed yards
He lingers where his children used to play,
Or through the market, on the well-worn stones
He stalks until the dawn-stars burn away.

A bronzed, lank man! His suit of ancient black,
A famous high top-hat and plain worn shawl
Make him the quaint great figure that men love,
The prairie-lawyer, master of us all.

He cannot sleep upon his hillside now.
He is among us:—as in times before!
And we who toss and lie awake for long
Breathe deep, and start, to see him pass the door.

His head is bowed. He thinks on men and kings.
Yea, when the sick world cries, how can he sleep?
Too many peasants fight, they know not why,
Too many homesteads in black terror weep.

The sins of all the war-lords burn his heart.
He sees the dreadnaughts scouring every main.
He carries on his shawl-wrapped shoulders now
The bitterness, the folly, and the pain.

He cannot rest until a spirit-dawn
Shall come;—the shining hope of Europe free:
The league of sober folk, the Workers' Earth,
Bringing long peace to Cornland, Alp, and Sea.

It breaks his heart that kings must murder still,
That all his hours of travail here for men
Seem yet in vain. And who will bring white peace
That he may sleep upon his hill again?

They Don't Believe in Mortgages

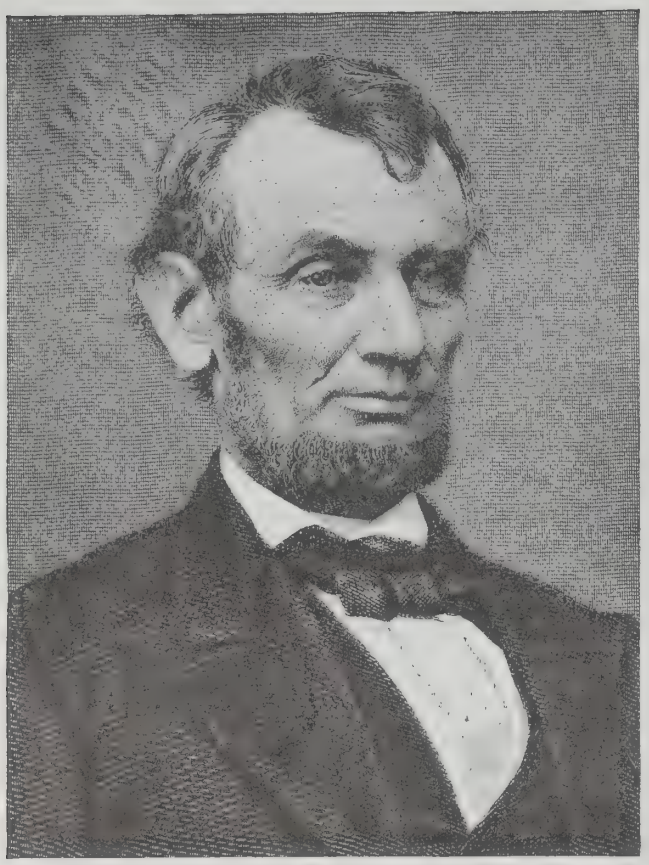
Concluded from page 6

of their homes. But the vast majority have all the comforts that money can buy.

What is true of Lancaster, where the largest settlements exist, applies to those scattered about all over the country in the other states named. The most of the people are of Dutch, German, and Swiss origin, but in the West there are several settlements of Russian Mennonites. Back in the earliest days of the denomination the simple faith of the Mennonites was carried to Russia by refugees from the Palatinate. It took root among the peasant folk, and later many of them followed the Dutch and Germans to the United States and migrated to Nebraska and other western states.

The name Mennonites is derived from the founder, Menno Simons, a native of Witmarsum, a small town halfway between Bolsward and Harlingen. Simons was born in the year Columbus discovered America. In 1534 a massacre took place in his home town of the Munsterites. Simons, who was a priest, had written a book against the Munsterites, but the massacre seems to have changed the course of his life and soon he left the church, became an Evangelical preacher and attained wide influence. Historians differ as to whether his own eventual huge gathering of followers were the Munsterites or an entirely new group. He was called to the bishopric of the Old Evangelical Baptists in 1537 and then began to tour Northern Germany, much of the time being compelled to adopt various disguises because a price had been placed on his head.

Mennonite leaders of today say that the rules which have made them successful were formed in these early days of persecution. Followers of Simons in Germany, Switzerland, and various other countries were aided by the "Committee on Foreign Needs" formed among their co-religionists in Holland, where religious liberty prevailed. This committee put up the funds for a large part of the early migration to the new land. In the early days the rules of the creed were extremely simple. The chief point of issue with the old church authorities seems to have been the insistence of the Mennonites on adult baptism. Ministers of the denomination were chosen from among members of the flock and served without pay. This custom is still followed in some of the settlements. In Europe and America for many years divine worship was held in private homes, and this custom is also followed still by some of the branches in some settlements. Churches, when they are built, are plain.



Mrs. Hutchins' favorite picture of Lincoln, which, she says, "Looks most like him when I saw him."

And Lincoln Said to Me:

"You cannot fly a high kite unless you have a long string."

When Little Betty Smith—"Chestnut Curls"—Received Advice Which Changed Her Life

By ELIZABETH G. HUTCHINS

(As told to a Dearborn Independent Interviewer)

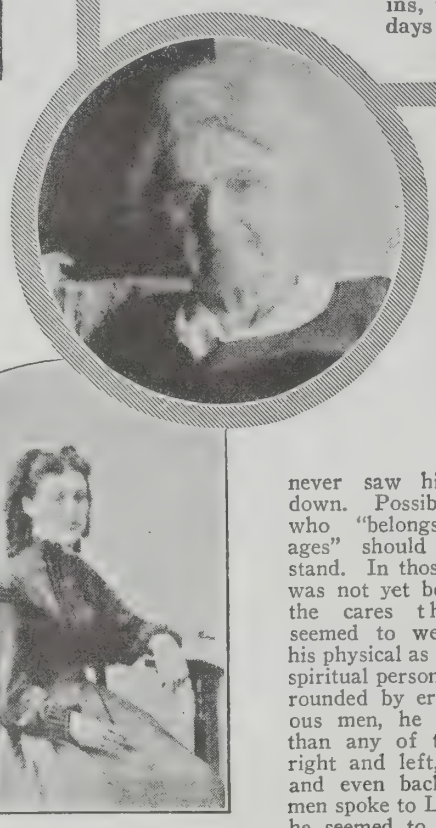
Out in Oakland, California, lives a woman who was a young school-teacher when Abraham Lincoln started from his law offices in Springfield, Illinois, to the Presidency of the United States. Though she is 86 years old, and has lived a life filled with hard work, her memory is still clear, and her personal recollections of the Great Emancipator are as distinct as if she had seen him yesterday. She is Mrs. Elizabeth G. Hutchins, though in Lincolnian days she was Betty Smith.

MY FIRST memory of Abraham Lincoln is of seventy years ago, when I, a girl of sixteen, was living in Oakville, Illinois, and is sustained by a series of events which, even today, are clear in my memory. My family was of the large and infrequently distinguished clan of Smiths, and I was little Betty Smith, with long and real curls of chestnut hair, and what my Scotch father often warned me as a "roving eye." Dressed in one of those high-collared, long-sleeved, tight-waisted, wide-skirted combinations that passed for the dressmaker's art in those days, I followed father through the state fair early in October of 1854, at Springfield, and heard much talk of a Senator Douglas, who had come out to defend his action in supporting the Kansas-Nebraska Bill, which had been passed by the Congress in May of that year.

Opposing Senator Douglas were a "Mr. Lincoln" and Lyman Trumbull. We saw Lincoln at the fair, and, later in October, after we had returned home, read his now-famous speech, delivered at Peoria. My father said, one night after he had read this speech for the third time: "Yon's a mon, wha'll bear watchin'. He hes th' gift o' thocht."

In November of that year, when Lincoln led in the formation of the Republican party, my girlish—I might say, "childish"—heart and mind flamed up in a desire to see this man, whom other men were beginning to name as a possible President. Yet it was seven years—not until 1861—before I saw him again. Meanwhile, I had received my "schooling," and had been granted a certificate to teach, was teaching, in fact, over in Hillsboro, Missouri. As a great holiday, when vacation came, I went to Chicago, with a family of friends. We stopped at the Palmer House, then the leading hotel of the Middle West, and there, as we came downstairs from our rooms to the old dining hall, we saw Abraham Lincoln, standing in the lobby.

To me, though I saw him afterward on several occasions, I always picture Lincoln as standing; indeed, I never saw him sitting down. Possibly a man who "belongs to the ages" should always stand. In those days, he was not yet bowed with the cares that later seemed to weigh down his physical as well as his spiritual personality. Surrounded by erect, vigorous men, he was taller than any of them. To right and left, in front, and even back of him, men spoke to Lincoln, yet he seemed to talk little, replying in a few words, a greeting here, an affirmative or a negative nod and a word there. Yet there was a smile for everyone.



Circle—MRS. ELIZABETH G. HUTCHINS today, in the parlor of the boarding house with which she supports her blind husband and herself. Below—Mrs. Hutchins, as a sixteen-year-old girl, 70 years ago, in Oakville, Illinois, before she met Lincoln.

Girl-like—and girls were not different then, except in dress, from the girls of today—I seemed to see an opportunity, and I took a few steps forward, impetuous, perhaps, the least bit curious, not a little determined. The father of my girl friend, with whose family I had gone to Chicago, said, "Wait a minute, Betty, an' I'll present you." He walked across the lobby to Mr. Lincoln, who greeted him with a widening of the ever-lurking smile. They chatted a moment, and I was called over, with the daughter of the family. A huge hand took both of mine, and a deep voice, way above my head:

"Well, well, little Betty, the school-teacher. If I had a teacher like you, I would be in school yet."

Imagine my confusion, when the men gathered around began to laugh with the booming laughter that came from above. Quick to sense my embarrassment, Lincoln said, softly,

"Never mind, Chestnut Curls, teaching is the most important work to be done in the world; keep at it."

Then he talked to me, asking me questions about my work and my ambitions. When I told him that my greatest hope was to teach some day in a "seminary," he replied:

"Then you'll have to study while you teach. You know, you can't fly a high kite unless you have a long string."

The sight of Lincoln, the touch of his hand, the friendly, honest glances of his eyes, changed my entire life. While I was in Hillsboro, I had become engaged to Albert Hagen, who, forming a company for the Confederate cause, became a captain in the southern army. After I had seen Lincoln, after he had talked to me, I *knew* that he was right, that slavery was wrong, and that any man who supported it never could be my lifelong companion. I returned to Hillsboro to my teaching, and broke my engagement with Captain Hagen. He went through the war successfully, and later became a judge in Santa Cruz County, California, but I could no more have married him than I could have doubted the word of Abraham Lincoln.

Public sentiment in Hillsboro was strong for the Confederacy, to which my "loyalty" was seriously doubted. To test my attitude, the people of the town appointed me to present the flag to Captain Hagen's company. That night I slipped out of the window of the house where I was boarding, walked four miles to the station and took a train back North to Illinois. I never presented that flag, and I never resigned from that school, but I kept an unspoken pledge to the tall man with the honest face, who had warned me to get a long string before I attempted to fly my kite high.

Later, I saw Lincoln several times in Washington. Once on the street, he remembered me and called me by name. I had the good fortune to become quite well acquainted with some members of his family. I recall, one day, going to the White House on an errand from my father to Secretary of War Stanton, an errand similar to several which I performed from our section of the country to Washington. Mr. Stanton read the papers I had brought him, and, while he was reading, the President came in. Stanton was a man of quick temper, and, after he had spent some time in reading the documents, said, rather sharply:

"There are other things more important than these reports; they can wait until tomorrow."

"Stanton," said Lincoln, dropping a hand on the shoulder of the Secretary, "did you ever hear that story about the swearing driver?"

"No, Mr. President, I never did," Stanton replied brusquely.

"Well, Fisk tells it on himself. It seems that Fisk started out as a colonel in Missouri, and when he had enlisted a regiment, he informed the men that he would do all the swearing done in that organization. They agreed, as they had to, and for some time no one heard any profanity around that camp. Then, one day, John Todd, a teamster, encountered several miles of mudholes, each one worse than the one before. About midway along this road, Todd let go a flood of cussing that reached even Fisk's ears.

"The Colonel called John into his tent, and said:

"'Look here, John, didn't you agree to let me do all the cussing for this regiment?'

"'Yes, Colonel, I did,' John answered, 'but this job of cussing had to be done right there and then, and I couldn't see you anywhere around to do it.'

"The point of that story is, Stanton, that anything which comes up today in this war must be done today in order to finish this war."

Stanton took the papers with a hearty laugh, and in a few minutes had a reply ready for me to carry back to my father in Illinois.

To me Lincoln lives just as really, just as vividly as he did seventy years ago. I believe that his influence, as well as his memory, comes down to us today, just as full of uplifting hope and sustaining helpfullness as it was when he stepped from the law offices of Lincoln and Herndon, down in Springfield, to the White House.

Winged Kings of the Coronados

Concluded from page 10

company three priests, pilots, cosmographers, soldiers and sailors, set out from the port of Navidad, about twenty-five miles from the present port of Manzanillo, on the west coast of Mexico, on June 27, 1542. The flagship, commanded by Cabrillo in person, was the *San Salvador*, while the other vessel, under Ferrer, was *La Victoria*. Both were hardly more than sloops, and would be condemned as fishing smacks today if they were offered to any offshore fisherman.

They first saw the Coronados on September 26, 1542, and occupied that day and the next in passing them, and sailing around them. Noting their barrenness, Cabrillo named them "Las Islas Desiertas," and Ferrer observed in his diary that they were uninhabited and apparently never had been inhabited. As an example of the inaccuracies of the observations of those days, it is worth noting that Ferrer declares these islands to be *three* in number, whereas there are five of them; that the largest is two leagues (approximately six miles) in length, whereas it is actually only *two miles* long; and that the group is three leagues (about nine miles) from the mainland, whereas the actual distance is seven miles. Then comes Vizcaino, who places the islands as "six leagues from the mainland," or some eighteen miles, and finds that there are *four* islands, in place of the *three* Ferrer saw, and instead of the five which actually exist. Vizcaino further declares that he named these islands the "Coronados, in honor of Francis Coronado, governor of the province of Xalisco, under Hernan Cortez." This province gave the name of "Jalisco" to a state in the present Republic of Mexico.

On his chart, however, Vizcaino names these "Las Islas de San Martin," and places an anchorage on the north side of the largest, which anchorage does not at present exist. Whether two islands have risen in this group since Ferrer passed, or one since Vizcaino saw them, is a question for geographers, geologists, oceanographers and historians to determine. So far, they apparently have not come together on the subject. To add to the complications surrounding the Coronados, Cabrera Bueno came along in 1734, nearly 200 years after Cabrillo discovered them, and renamed the group "Las Islas de San Martin" (the Islands of Saint Martin), following the chart of Vizcaino, and describes the group as consisting of one large island and *three* small Farallones.

Cabrillo survived his discovery of the Coronados by only a few months, dying in the lonely harbor of Posesion, on San Miguel Island, some 250 miles northward along the California coast, in January, 1543. Where he was buried no man knows, and his bones never have been found, unless some sheep herder or fisherman on San Miguel has found them while wandering about this picturesque island. Thus, one more mystery is added to the many which hang like a fog around the half-submerged mountain tops which constitute the coastwise islands of California and Lower California. It is said that a considerable amount of gold, taken from the coastal Indians, was buried with Cabrillo, but if this be true, which is doubtful, the Portuguese navigator left no map and his companions, though living for some years, told no tales whereby the treasure could be recovered.

When Lincoln Said, "I Am Master"

Concluded from page 2

vited them to come again and meet in person the members of the Cabinet and tell them frankly what they were saying to him. They came again, and the entire Cabinet was present except Seward. Senator Collamer presented to the President in writing the view of the Republican caucus. The President invited the members of the Cabinet to reply. Their answer took the wind out of the sails of the report:

> Chase, Blair and Bates made speeches—the others said nothing. The purport of the speeches was to prove that the Cabinet did hold meetings, and that there were no dissensions among them—Mr. Chase among others stating that they were all harmonious.

That must have been a surprising statement for Chase to make in the presence of Wade! The committee could not say very much after that, nor does it appear that Lincoln said much of anything. He had no need to say much.

If the committee was astonished at this information, so was the caucus when the committee made its report. "I asked Judge Collamer," wrote Browning, "how Mr. Chase could venture to make such a statement in the presence of Senators to whom he had said that Seward exercised a back-stairs and malign influence upon the President and thwarted all the measures of the Cabinet." Collamer could only growl out an angry answer concerning Chase. That answer was in two words—"He lied."

With such a report before it, what could the Republican caucus do? It did not see that it could do anything. It heard the report of the committee, learned that it could not depend on Chase to repeat in the presence of the President and the rest of the Cabinet what he had said to Wade, and the caucus ingloriously adjourned.

That night Browning called again at the White House. He was ready with suggestions for the new Cabinet which he hoped Lincoln would appoint. He suggested as Secretary of State, first Collamer, of New York, and then Ewing, of Ohio. For Secretary of War he would have General Banks. If Lincoln took Collamer as Secretary of State, then Ewing would be a good man for Secretary of the Treasury. For one of the other places he suggested Guthrie, of Kentucky. He did not propose himself as a member, but it is scarcely possible that he thought of a new Cabinet with himself out of it.

Lincoln told him frankly that he did not propose to have any new Cabinet. He said that if he got a new one, the same men would attack it who were now opposing the old one. He said he would rather get along with the one he had than try a new one.

By this time, he had Browning half-convinced. And then Browning recalled, and mentioned to the President, that the men who had instigated this revolt were partisans of Chase:

> I told him that their game was to drive all the Cabinet out, then force upon him the recall of Mr. Chase as premier, and form a Cabinet of ultra men around him.

Lincoln understood this quite as well as Browning did, and assured Browning that the Senate would not be allowed to compel him to adopt any such measure. When Browning went to the White House that night, December 22, 1861, he told the President "that this was a time of more peril than any we had encountered" and wanted him to make up a new slate for a Cabinet. He left convinced that the President was right in his determination to keep the old Cabinet, and let his opponents howl.

"He said with a good deal of emphasis that he was master," wrote Browning.

He said the truth. He was master, and he knew it, and those who opposed him were to learn it.

Let us pause for a moment to consider this emergence and ascent of Lincoln from out of the depths. Perhaps in no other crisis of his Presidency is there a more complete and significant example.

He had promised God that if General Lee was driven out of Maryland, he would issue the Proclamation of Emancipation. He issued that proclamation against the judgment of several members of his Cabinet, believing that it would commend itself to the favor of the people and to the blessing of God. Apparently it did neither. Lincoln never felt more completely God-forsaken than in the weeks after that proclamation bore its fruit. It seemed to him, as he told Browning, that God was against him, and it seemed also that the people, whom he trusted next to God, had also cast him adrift. Repudiated at the polls, he was deserted by Congress and betrayed by members of his Cabinet. The ballot failed him; the army failed him; the heavens above him were brass. Never was he nearer despair than on the night when the committee from the Republican senatorial caucus was on its way to the White House.

He met that committee courteously, and received their report requesting him to dismiss his Cabinet and change his entire policy. He dismissed them with a request that they leave their report with him for consideration, and come again. When they came he had his Cabinet there, save only Seward, whose presence might have provoked them and led Seward to indiscretions. He shrewdly kept still and let Chase speak for himself, following the wisdom of the Arab proverb, "When the wind blows your fire, save your breath." He sent the committee back, discomfited, but with no occasion for anger against any one but Chase. Again he could chuckle, as he did when Buchanan and Douglas were fighting each other—"Go it, husband, go it bear!"

Then, when the committee had gone back to the caucus, and the caucus, having exhausted its oratory and accomplished nothing, adjourned, Browning, thinking the President would now gladly do voluntarily what he could not with good grace have done under compulsion, went over to assist Lincoln with the new Cabinet, and found Lincoln adamantine, and went away more than half-believing that Lincoln was right. That lonely man, no longer despairing, no longer forsaken of his God, no longer hesitating between opposing counsels, calmly declared that he was master of the situation. Though his army was defeated and without a general, his Cabinet divided and without heart, his Congress rebellious and his friends in despair, Abraham Lincoln stood calmly, with a new faith in God and the cause for which he was fighting.

That faith was justified. The Proclamation of Emancipation raised up new friends in Great Britain, and drove the last nail in the coffin of Europe's recognition of the Confederate Government. It gave a new moral definition to the conflict. Again the armies prepared for battle, singing as they marched:

> "We will rally round the flag, boys,
> We'll rally once again,
> Shouting the battle-cry of freedom."

The fortunes of the administration were at a low ebb. One thing, however, was becoming apparent; so far as any one in Washington was in control of the situation, it was not Congress, nor the Committee on the Conduct of the War, nor the Cabinet, nor the army, nor even, as Chief Justice Taney was to learn, the Supreme Court; it was the President. They who had thought him a weak man, easily controlled by stronger natures, were learning that Abraham Lincoln could be almost despotic. They did not hesitate to say this of him, and to declare that under his administration the United States had become a military despotism The country was beginning to learn who was at the head of the administration. There was one man who never had any doubt who was master. That was the man who was accustomed to receive stacks of letters and telegrams and editorials requesting or demanding that he do this or refrain from doing that, and to stuff them all into a pigeonhole, saying, "I know more about it than any of them." That was the man whom some people thought self-distrustful, and many now call modest, Abraham Lincoln.

"He said with a good deal of emphasis 'I am master.' "

What "The Mark of the Scalpel" Tells

Concluded from page 11

dience and in the full blaze of light he flourished aloft in a stage-like attitude a dagger and proclaimed, 'The South is avenged!' and not until he had given this theatrical exhibition did he cross the stage and fly. Would any sane man have acted in this way?"

Dr. May reaches the conclusions, therefore, first, that the murder was committed by a man of abnormal mentality and second, that the body brought back to Washington was, beyond doubt, that of the assassin.

In the Library of Congress, along with Dr. May's remarkable little manuscript, are hundreds of other papers bearing on the life of Abraham Lincoln. There are many letters written to his Secretary of War, Mr. Stanton. There is a part of his last annual message to Congress. There are the first and second autograph drafts of the Gettysburg Address and an autographed copy of the Second Inaugural Address. There is a manuscript by the judge who presided at the trial of the Lincoln conspirators. Of especial interest is a collection deposited by Robert T. Lincoln, son of the martyred President. This will not be open to inspection until twenty-one years after the donor's death.

But among all the original manuscripts of such priceless historic interest, there is none that tells a more dramatic story than "The Mark of the Scalpel," so graphically written by Dr. May.

Lincoln's Secretary Talks of His Chief

Concluded from page 12

score and ten recounted the incidents of the exciting Civil War days stored away in his splendid memory, "I read every letter that went to the President or Mrs. Lincoln. I am still happy when I remember it was I who kept most of those letters from their eyes. Many of them were fanatical, abusive, directed not only to the President but to the First Lady of the Land as well. I never let either of them see those abusive ones.

"The office-seekers were our second greatest pest," continued Mr. Stoddard, referring to a presidential liability which still prevails under our party system of government. "The Executive Mansion was a curious study during many days and weeks following the inauguration. Its halls and offices were literally packed with human beings. There were days when the throng of eager applicants filled the broad staircase to its lower steps; the corridors of the first floor; the famous East Room; the private parlors; while anxious groups and individuals paraded up and down the outer porch, the walks, and the avenue. We could dispose of abusive letters by throwing them in the wastebasket, but those persistent applicants for jobs, who took up entirely too much of our time and by various strategems sometimes got by us to the President himself, could not be got rid of in that way."

A charming picture of Mrs. Lincoln hangs in the Stoddard home, given to him by Mrs. Lincoln herself. "Sometimes they joked and called me 'Mrs. Lincoln's secretary,'" Mr. Stoddard chuckled, "while at other times they called me 'Lincoln's devil!'

"Mrs. Lincoln," he added, "was one of the most intelligent of women. I shall never forget my acquaintance with her."

Mr. Stoddard continues:

"There was something phenomenal in the way Lincoln could arise to the occasion. Outwardly he would often appear indifferent, vacillating, or floundering in indecision, but when the real crisis came his whole face would light up as from a fire, while his whole body, driven by the force of a sudden spiritual urge, would straighten up from its gaunt awkwardness ready to execute the dictates of his unconquerable will. I have seen him undergo almost complete transformations, at various times, from an attitude of apparent calm and indecision to one of spiritual storm and electrical performance. The whole personal appearance of Lincoln changed, when the 'inner man' was called out for some great reason.

"The crowd only saw Lincoln from the outside, with his jokes, with his speeches, with his settled plans, but I saw him struggling for decisions, searching himself, analyzing his problems, praying for guidance, like Jacob wrestled with the Angel, when suddenly, as one inspired, he would find a solution and his whole being seemed to concentrate on the way out, while his face illuminated from the fire of his soul.

"Abraham Lincoln was a calm man with a fire inside of him. He had a temper, too, but he had it well under control as a rule. I recall one time particularly when he was getting very impatient about the readiness of an offensive campaign. He was alone in his room when an officer of General McClellan's staff was announced by the doorkeeper and admitted. The President turned in his chair to hear, and was informed, in respectful terms, that the advance movement could not be made.

"'Why?' he curtly demanded.

"'The pontoon trains are not ready—'

"'Why in ——— ain't they ready?'

"The officer could think of no satisfactory reply, but turned very hastily and left the room. Mr. Lincoln also turned to the table and resumed the work before him, but wrote at about double his ordinary speed.

"The outer body of Lincoln was only a shell for the 'inner man.' He paid little attention to his appearance.

"After a night of wrestling with the angel of despair, I can remember sitting talking cheerfully with him and others, when John Hay would come in.

"'John, tell that funny story over again,' Lincoln would say, and Hay would tell it, while the President would lie back in the chair they called Andrew Jackson's and laugh. And then, when the President and his three secretaries were thus relaxing, Secretary of War Stanton would appear at the door. It was the war which always broke into everything."

As secretary to the President, Mr. Stoddard had opportunity to meet all the prominent men of Washington of that day. One of his duties was to be in attendance upon Mrs. Lincoln at all public and private receptions and he often received with the President. Among those he knew in more than a casual way, then and later, were General John A. Dix, General Burnside, General Joe Hooker, James A. Garfield, James G. Blaine, Grover Cleveland, General Ottis, General Grant, General McClellan, Colonel Kit Carson, John C. Fremont, and Carl Shurz. Among his literary acquaintances were G. W. Curtis, Whitelaw Reid, the Harpers, Richard Watson Gilder, Mark Twain, and William Cullen Bryant.

Mr. Stoddard, after the close of the war, was appointed Marshal of Arkansas, where, as one representing Lincoln, his life was one of peril and romance. He was in Arkansas when Lincoln was assassinated, but left shortly thereafter on account of ill health, resulting from deadly malarial fever of the swamps. He was not expected to live. But, lo, here he is, still with us, a pretty hale man yet in his ninetieth year.

He is an author, having written seventy volumes in his time. He wrote the first "Life of Lincoln," "Lives of the Presidents," many books for boys and girls, while contributing to such periodicals as *Harper's, The Post, Examiner,* and New York *Weekly,* some of which have already passed away. Mr. Stoddard was active along literary lines until seventy years old. Since then he has spent a quiet old age with his son and daughter at Madison, New Jersey. In his tone, in his gestures, with his dramatic pauses, he reminds us of the men of the old school, strong, energetic, and individualistic, with still a good deal of fire in his own soul.

February, Mother of Seven Immortals

Concluded from page 5

their wives, one of them (Lincoln) wanted to marry another girl, and before he married his wife had, apparently, to be watched, so strong was his bent toward suicide, and one of them (Pepys) was by his own account continuously unfaithful. Four of them (although in different degrees) were influenced by their mothers (Ruskin, Lincoln, Washington and Edison) and both Pepys and Dickens were also influenced by their fathers, but perhaps more in a negative than a positive manner. This negative influence, indeed, in the lives of all great men, must not be overlooked. It may produce greater results than appear.

Washington was undoubtedly influenced thus by his mother and his relatives. Dickens held up his father as Micawber always "waiting for something to turn up." Lamb's whole life was a repression, due to what may be termed the negative influence of his own physical defects. In terms of psychoanalysis, it is the pressure of inferiority, no matter where the inferiority is shown.

What a month is this fickle February, to produce such diversities of gifts! It took her three centuries to range from Samuel Pepys to Thomas Alva Edison, but from 1732 to 1809 she produced three of our tallest immortals—all of them over six feet.

There were giants in those days!

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

A highly prized gift of a Laplander to his sweetheart is the inside of a seal's stomach, for there is usually something green in it to be eaten.

The gum from the roots of the Kauri pine of New Zealand is dug by Dalmatians from the ground in the same way as placer gold is gleaned from gravel pits.

No cases of rabies have been reported in England and Wales since 1921.

The importation of pins into England was forbidden in 1483. They were expensive and, with ladies at that time, "pin money" was a consideration.

Divorces are more numerous in the western states where women are scarce, than in the eastern states where women outnumber the men.

More than a fourth of the Swedish-born farmers in the United States are in Minnesota.

Hydraulic cement was first made by Canvass White, of Rochester, New York, in 1818. This liquid rock was used to hold together the huge under-water blocks of stone set in place by the builders of the aqueducts and locks of the Erie Canal. This claim is made as against that for Joseph Apsdin, a stonemason of Leeds, England, who was widely acclaimed when recently a monument was raised to him as the first cement maker.

The subscription price of the Russian *Pravda* is thirty poods, or more than a thousand pounds of rye, per annum. A farmer would pay practically one-fifth of his farm income for his daily paper.

Natives of the Gold Coast use nickel coins with a hole drilled through the center, so that these folk, who possess no pockets and few clothes, may string their money round their necks. The coins are made by the Royal Mint in London.

The oldest leather makers in the country is the firm of J. W. Rhoades & Sons, Philadelphia, established in 1702.

The William Penn Charter of Liberty was exhibited under strong guard at Independence Hall, beginning the first of the year, until it could be transferred to the state archives at Harrisburg, Pennsylvania.

So great has been Irish immigration into Scotland of recent years that Scottish publications are beginning to print articles about "The Irish Menace."

Stilton cheese, named for the village of Stilton, Huntingdonshire, England, was first made by the village innkeeper, and travelers calling at the inn soon spread its fame.

Hats were once worn only by freemen; slaves went bareheaded. A freeman voluntarily removed his hat as a symbol of respect and service, which in time became a common courtesy. Thus we take off our hats to ladies.

An Indian, who once wore the blanket and received government rations, is today guiding the Senate of the United States. He is Charles Curtis, of Kansas, who has taken the place formerly filled by Henry Cabot Lodge.

Mackay, a mountain town of Idaho, has two water supplies—a cold spring for summer use and a piping-hot volcanic hot-water stream for winter.

The "hochdneckkondensationsdampflokomotive" has at last been invented—in Germany, of course. It is not merely a word of thirty-seven letters, it is a "high-pressure-condensing-steam locomotive."

A new gooseberry as large as a plum has been discovered in the woods of Northern Florida, a region where gooseberries have never before been known to grow.

A Kansas man pawned a ten-dollar bill for nine dollars. The broker told the police that the bill was a present to the borrower who needed some money but did not care to relinquish his rights to the bill by spending it. The bill is genuine.

The "Phage" is a parasite which feeds on disease bacteria. Its deadly power has already been demonstrated on pneumonia, typhoid, diphtheria, chicken cholera and anthrax bacteria. It may also prove a solution for the tuberculosis bacillus.

Statistics prove: that the number of deaths from tuberculosis is decreasing; that the number of deaths from cancer is increasing.

When the volcano Krakatao exploded in 1883, dust, which was thrown into the air to an estimated height of nearly 20 miles, was detected in sunset colors all over the earth for more than three years after.

The earliest wooden coffin in England was that of King Arthur who was buried in a hollow log.

With 46.2 per cent of her male population over 15 years of age still single, Nevada has the highest percentage of single men of any state in the Union. On the other hand it has the lowest percentage of single women, only 19.3 per cent being unmarried.

The southernmost permanently inhabited spot in the world is Laurie Island in the South Orkneys, where employes of the Argentine Meteorological Service live.

Out of twenty-six precolumbian Indian mummies examined at the American Museum of Natural History, sixteen had head lice or nits of some kind.

Half of the foreign-born women and one-third of the foreign-born men in the United States are still aliens.

New York City, with a population of 5,620,084 at the time of the last census (1920), has as many people as thirteen of the least densely populated states combined.

"I Read in the Papers—"

I read in the papers that old Henri Geeraert is dead. Didn't know him? He is the man who headed off 1,000,000 soldiers. Antwerp had surrendered and the German army was marching victoriously across Belgium, everything flying before it, the General Staff's plans coming off to the tick of the clock. The Belgian army was within its grasp, Calais just within reach. Then old Henri Geeraert thought it time to do something. He turned on the water. For 48 hours the flood poured in, but the Germans did not see it; the water was soaking into the spongy ground and turning it into treacherous bogs of slime. Then the water began to show on the surface. It rose and rose. The Germans were effectually stopped. The whole line of campaign was halted. A sluice-keeper had changed history. He died the 17th of January. Poets will sing him and artists paint him in the future. But despotic folly will continue to forget that by little things are the mighty confounded.

I read in the papers that cadet troops, the future officers of the Argentine Army, did the goose step when they were paraded before General Pershing. The goose step may be gymnastic or political—according as one views it. As gymnastic it gives the user several miles of exercise in a quarter-mile's walk; as politics, it spells German influence. Occurring in South America it emphasizes our unpopularity there. Not that the South Americans know us (whom they call the North Americans) but they know hordes of aliens who have gone down there in our names and practiced their own arts. South America is more a moral problem than anything else. Our Government as a rule has been wise and generous in its dealing with the countries of South America, but there is an uneasy sense of un-Americanism when the activities of our American section of international finance is concerned. The root of most of the dislike existing against the United States is money, and the money does not belong to the United States, either. Will the Government wake up one day and shake off the incubus of International Finance that now winds around it?

I read in the papers everywhere accounts of political graft—in city councils, in boards of education, in public utilities, some of it the most picayune graft, some of it exhibiting big crook ability, but all of it shattering our illusion that in these good days public men had got beyond that sort of thing. The fact is, political life in the United States continues rotten, and this goes for Washington as well as for municipal government. And another fact is, that men who make politics their business are, sixty per cent of them, morally inferior to the people they would represent—not necessarily morally inferior in their personal conduct, but in their whole philosophy of life. Set even Congress down in any average small town in Central United States, and let Congress (not as a body, but as some 400-odd individuals) continue their usual recreations and voice their usual daily practical philosophy and the small town would be scandalized into Vigilance Committee action. Our politicians are simply not representative. It is rather a tough thing to say, and doubtless enough exception could be raised to dull the point of it considerably, but as a statement of general survey it will stand. Lord Bertie, in his diary, wrote (Sept. 8, 1915) "Politicians are everywhere a rotten gang," and he was writing of politicians who did not graft. It is not enough for members of government to be responsive to the people's demands in legislation, they should also be *representative* of the average moral temper of the people. As it stands now, the people collectively have higher standards than do their lawmakers collectively.

I read in a letter from an appreciative reader of Mr. Ford's Page this interesting bit: More than 25 years ago I was walking along the streets of ———, with Captain ——— and as we were nearing the Court House the Captain asked, "Would you like to look through our Court House?"

"Why, no," I replied, "I have been in dozens of Court Houses and they are all very much alike. It would be a waste of time."

"That's true," mused the Captain, "for in every Court House you will find a force of men and women figuring—figuring industriously every day, except for the time they loaf on the job."

"But, Captain," I commented, "what are they figuring?"

"Oh," he replied, "they're figuring how much each one of us must contribute."

"Contribute to what?"

"To a fund."

"A fund for what purpose?"

"Why, a fund to pay them for figuring how much we each should contribute."

"But, Captain," I protested, "don't you get anything out of the taxes you pay except this figuring service?"

"D———d little," he snorted. "Oh, now and then a small culvert or maybe an occasional bridge, but by and large, about all that bunch in there does is to figure how much each of us ought to contribute toward keeping them at work figuring."

Mr. Ford's reference to "paper work" reminded me of the Captain's quaint idea. "The high cost of maintaining cost systems" is an epigrammatic statement of one of the causes of the high cost of living. At times I think we have gone accounting mad.

MR. FORD'S Page this week discusses Progress—is it our achievement, or our test? Is it Progress, or their use of it, that insures a people's continuance?

ARE we Americans acting like Skylocks toward our foreign debtors? We are so often told that we are, that we sometimes believe it. But what we are told is often what interested parties want us to think. Beware the propaganda bug. On page 4 you will find some straight stuff about the whole business.

WE ARE witnessing the early stages of Woodrow Wilson's progress into the Valhalla of history. The man is better known today than when he lived. Huston Thompson was a student under Professor Wilson, a friend and confidant of Governor Wilson, an appointee to a high office under President Wilson. On pp. 3 and 4 he commences a real contribution to Wilson literature.

ONE of the tragedies of life is to get what we want and then discover that we don't want it. Emma Goldman used to regale us newspapermen with visions of the blessings of anarchy. One of us, Judson Grenell, hunted her out in her London refuge after she had tasted the "blessing." It's a human document—page 5.

THE exasperating element in modern degeneracy is its cleverness. It is usually combated with bad temper, not with equal cleverness. Mr. Mencken is a clever writer but decadent; with equal cleverness and greater power Professor Sherman takes the hide off the Mencken literary pose. Menckenites, who yet retain their taste, will enjoy page 6.

THE ancient charm of Oxford towers (p. 9); China's ancient doctrine of many sons, which accounts for China's teeming millions (p. 12); the ancient origin of Scotland's kilt which links that people to ancient Israel and Egypt (p. 15), are all interesting and informative in their way; they widen one's horizon.

IN OUR shop the other day I saw an "inch" that cost over $1,000—a little cube of steel which measures the absolute inch. Do you know what an inch, or a quart, or a pound is? Do you know how important they are as affairs of state and history? It's partly told on page 11.

ANIMALS have common sense; they think; they act on reason. But it takes patience and insight to be sure of that. If you like the animal life of the planet, or mind anywhere, you will like page 10.

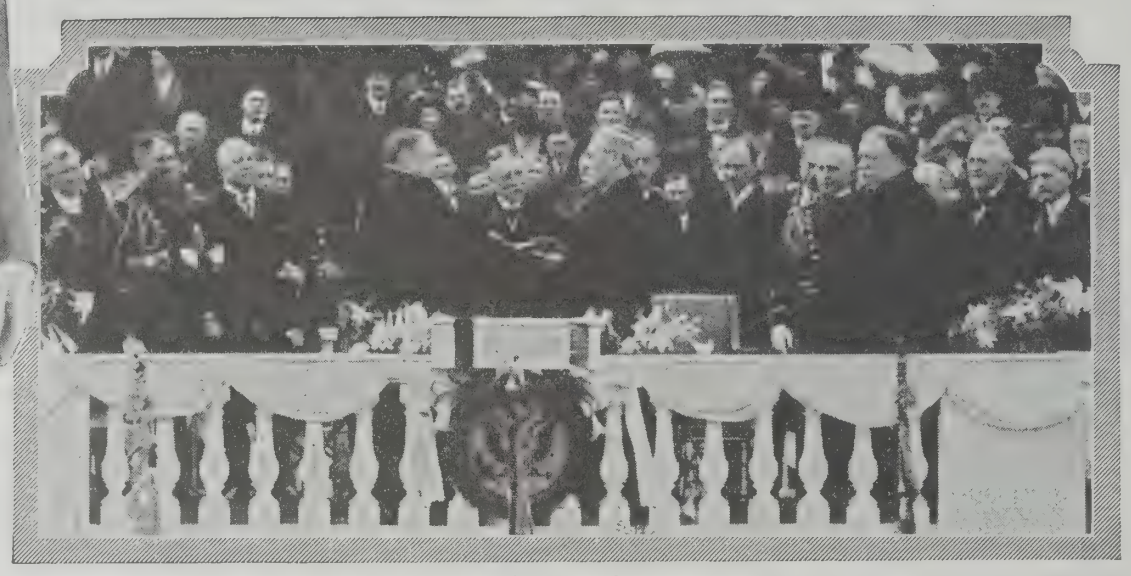
PRESIDENT WILSON

An excellent likeness of President Wilson photographed at St. Louis on his trip around the country.



Inauguration of President Wilson, 1913. (C) Underwood & Underwood

WOODROW WILSON had finished one of the great speeches of his career. His subject had been the Tercentenary of the King James Version of the Bible and he had spoken at the vast auditorium in Denver before a capacity audience. This was one of a series of speeches that he had been making across the country and was the second of the day. He had retired to the sixth floor of the Brown Hotel in Denver and was stretched full length resting on a lounge. As he relaxed in easy conversation, he paused for a moment as if an unexpected thought had occurred to him, and drew from his pocket a wallet from which he extracted an old stained newspaper clipping. Turning to me he asked if I had ever read Kipling's "If," and on my replying in the negative said, "Well, let me read it to you." In that peculiar soft cadence for which he was known he started the poem, warming up as his imagination responded to its inspiring lines. He paused as he read:

"If you can meet with triumph and disaster
And treat those two imposters just the same:"

and added with a grim smile, "Are they not well described, those two rascals?"

Probably he was thinking of his own recent career when rising to the heights of university leadership in America, he had come in conflict with the aristocratic tendencies of the hour, and meeting with defeat, and the disappointment following the failure of his cherished ideas was almost propelled down out of Princeton and up into the gubernatorial chair of New Jersey.

Again he paused to read a second time the fol lowing lines:

"If you can bear to hear the truth you've spoken
Twisted by knaves
to make a trap
for fools:"

By this time the grimness had faded out of his countenance and a look of joy lighted his eye when he said: "Here are the best lines of all":

"If you can make
one heap of all
your winnings
And risk it in one
turn of pitch-and-
toss, and lose,
And start again at
your beginnings and
never breathe a
word about your
loss:"

"Well," I interjected, timidly, as one would who had been a student under him, and was still unable to blot out the picture of the teacher wrapped in dignified scholastic atmosphere, "I never realized that you had the gambling spirit."

"No!" he replied, "nor has anyone else. Yet I think I can get more zest out of risking all on one throw for a cause than from any other experience."

Little did he dream at the time that a whole nation and, in fact, the whole world would one day witness him gambling his all in a "solemn referendum" on the League of Nations.

When he had finished reading the verse, he said:

"When I am tired out and discouraged by the attacks of others, I often read this poem over. I find it is very stimulating, and it has the effect of stiffening up my backbone so that I am ready to go on with the fight."

On other occasions Wilson spoke of this poem to some of his classmates and other friends and commented on its lines in a similar vein.

Few persons except those who were his intimates ever realized how slow Woodrow Wilson was in making up his mind, and how much like Lincoln he was during the period of mental gestation of a subject. In such a time, he mentally browsed around, was open to suggestion, and literally squeezed the sponge of information dry. Often he would throw out arguments to draw light from the minds of those conversing with him. It was during this period that he could and did easily change his views. In fact, he could think and "not make thoughts his aim." But once having reached a final conclusion, if forced into action, he deemed it a mistake to change. This was not due to what people generally understand as stubbornness, but was supported by reason and logic.

Shortly after his first inaugural, I called on him at the White House at the request of certain business interests in the West, who, relying on my acquaintance with Mr. Wilson, had asked me to bring up a proposed change in the Payne-Aldrich tariff law which these interests asserted would have a very damaging effect not only upon them, but also their competitors, and the farmers in the West.

Ever since his election in November, he had been giving a good part of his time to the subject of the tariff, and a great deal of study to this particular schedule. He had interviews with many experts and with members of Congress who would have charge of fashioning the new tariff law. Finally a bill containing his views had been drawn up for the consideration of Congress.

In the preliminary part of our conversation, I explained that I had no personal interest whatsoever in the matter, but was only acting at the solicitation of those who were financially interested and who had given me all the arguments that I would present to him. With patience he permitted me to elaborate the subject, giving no intimation of his views until I had finished.

Then with a look of determination he said kindly, but emphatically: "No. I cannot do it. I have given this matter full consideration, and have sought every bit of unbiased information obtainable. I believe that the rate in the tariff bill is based upon the best light that we can get on the subject. Should I yield at this time, and open the door for reconsideration the interests will sense the fact at once and having broken through, they will be upon us like an avalanche. Once they get us on the run, they will seek to undermine the whole bill, and we will have an experience with the tariff such as the previous administration encountered. No, so far as I am concerned they can take the bill as it is in its entirety or leave it."

His words were spoken with a friendly finality that left no room for continuing the subject on my part.

But he was not through with the conversation for he switched to the subject of Mexico which problem had been left on the new administration's doorstep by its

predecessor: "Some of those who have concessions in Mexico," said he, "have already been pressing me to take action down there. If they think that I will use one ounce of force in aggression toward that helpless country for their private gain, they are badly mistaken." Here again there was every indication that his mind had closed.

It was on this occasion that President Wilson also launched into an attack on the monopolists of America that was as severe in its stricture and language as anything Washington ever uttered toward "these pests." It may be recalled that some of Washington's language was almost ferocious. This hatred of privilege continued with Wilson until his last day. Even on his sick bed, he did his utmost to fend off the approaches of the representatives of the interests. In some instances, he took active participation, as the records of the Federal Trade Commission bear witness.

While the subject of special privilege roused him like a call to battle, he was always able to joke about it. During the 1913 campaign, he was sitting in a dining-car traveling through the State of Kansas, when Victor Murdock, who was then campaigning for Congress and whom Wilson in after years appointed to the Federal Trade Commission, happened by accident to meet him there. As Mr. Wilson was sounding the note of the "New Freedom" which was nothing more than releasing the people and the government from the control of monopoly, and Murdock was also talking along this line, the subject came up for discussion and Murdock put this question to him:

"Well, Governor, after all is not the chief purpose of democracy to allow the multitude as much freedom as possible?"

"No," laughingly replied the Governor, "its chief purpose is to keep some individuals from having too much freedom."

His interest in the competitive system which he saw as the chief safeguard against monopoly aside from the "bread and butter" effect that it had on the economic life of the day, appealed to him with great intensity because as he said he felt that "combinations of business units closed the door to opportunity in commerce for the young man who was coming up to take a place in the business world, and thereby cut down the chances for our youths to express their own individualism in independent competitive units."

But despite his militant attitude toward special privilege, trusts, and monopolies, Woodrow Wilson always recognized the right of natural growth in business no matter how large it might become. His battle was not with this but with the combinations which were artificially created by absorbing competing plants and lessening competition, and with those corporations that combined to fix prices.

Had the European war not come upon us during his first term, it was Woodrow Wilson's plan, having finished his legislative program and secured the necessary machinery for contending with monopoly, to make a drive against it through governmental agencies. One of the agencies that he expected to be used more than any other was the Federal Trade Commission. In fact he used it just as much as it was possible in those trying days before we entered the war. It was he who set in motion the investigation by the Federal Trade Commission of the meat packing industry of this country.

Never for a moment, when because of this investigation the commission was attacked from every quarter, did he waver in his support of it. In fact, he went so far on one occasion as to request the Attorney-General of the United States not to act in the matter of a certain decree without the unanimous approval of that decree by the Federal Trade Commission. As late as January 12, 1922, he wrote me as follows:

> "I have, of course, from the first, had the success of the Commission very much at heart and shall always follow its work with the greatest interest."

One thing in particular that was a constant source of worry to Woodrow Wilson was his appointments upon various commissions. He gave vent to this trouble on numerous occasions. I particularly recall an instance, which occurred on December 1, 1916, when I had an interview with him in his study room on the second floor of the White House. This is the same room that was occupied by Lincoln and his successors for intimate work in connection with matters of state apart from the executive offices. Of course, during the Lincoln Administration and up until Roosevelt's time, there were no executive offices and most business was transacted in this study room. On entering I saw the President sitting close to an open fire. He was suffering somewhat from a cold and was quite hoarse, and had cut off most of the ventilation so that the room was very warm. The matter which was brought up for discussion led to the subject of the encroachment of big business upon governmental functions, and the part that the Federal Trade Commission was playing in the business world. As if thinking aloud, he said:

"I am almost loath to appoint lawyers on any one

Wilson's newspaper cabinet.

of the commissions, and the Federal Trade Commission in particular, for immediately they become members, they begin to tie up the processes of the commission in technicalities, and limit the scope of its jurisdiction by reading limitations into the act. Then again they are so influenced by precedent, whereas these commissions should be dealing with every subject as a new problem in this rapidly changing economic world. Working from

(C) Harris & Ewing

WOODROW WILSON.

the lawyers' angle, if they dominate its membership, commissions soon become helpless. Take the case of our courts and their attitude toward the Sherman Act. They have been so fearful of temporarily deranging business that they halt on the doorstep of monopoly and insert the word 'reasonable' before the phrase 'restraint of trade' so that we now have so-called 'reasonable restraints of trade' when the test should never be based upon the reasonableness of the restraint. There may be restraints of trade so insignificant as not to be worth considering, because they do not involve the competitive system, or the restraint may offer protection to the competitive system, as in a case where a group of small concerns are forced to combine to meet the onslaughts of a great combination which by its use of power threatens to wipe out the individual companies. Here, instead of restraining trade, the combination of smaller units, so long as it does not restrict the rights of other corporations, may be effective in preserving competition. Of course, one must be careful that the small combination does not suddenly grow into a great combination but that is where the discretion and good judgment of the members of the commission can operate. Where the courts failed was in substituting language of their own for that of Congress and in seeking to base the test on the reasonableness of the restraint, whereas the test of Congress was intended to turn on whether the restraint lessened competition."

As a student under Mr. Wilson, I recall his great emphasis upon the subject of representative government. After graduation, I had the pleasure of hearing him reiterate his views in a way that left no room for doubt that he was still thinking on this subject as he had spoken in the classroom. But here again his mind was only in a period of gestation, and he had been merely theorizing upon the subject. It was not until he ran smash up against the failures of representative government and the combinations of interests that blocked the people from getting responsive action from their representatives that his mind transferred its point of view from the theoretical to the practical. This he did apparently without regard to the criticism that might be hurled at him.

An instance in point was his change from being a strong advocate of the representative form of government to a belief in the initiative and referendum. Immediately upon his declaring his attitude in his Inaugural Address to the legislature of New Jersey, his enemies and the unthinking challenged him for having deserted representative form of government and those who were hostile impugned his motives by saying that he was playing for political favor with the modern trend of thought among the masses.

This charge was, of course, absolutely false, for Woodrow Wilson by advocating the adoption of the initiative and referendum did not intend it to be used as a customary action in political life. In fact, as he expressed it at a "Mile High Club" dinner in Denver on one occasion, it was to be used simply as "the gun behind the door" when recalcitrant legislators who had been influenced by special interests refused to respond to the will of the people. Just as the gun behind the door in the pioneer home was seldom brought out to attack the enemy, but its presence was a constant warning, so the initiative and referendum were to be useful more through the knowledge of their existence on the minds of those who were opposing the desires of the majority.

The sudden change by Mr. Wilson startled many of his former students who in their complete admiration for his knowledge of representative government, and his ability to translate its virtues to his pupils, had been persuaded to follow these teachings after they had left college. Subsequent to his inaugural address he was queried by many of his former students. In answer to a letter from me on March 21, 1911, he wrote as follows:

"My attitude toward the initiative, referendum and recall is this. My judgment was first very much against them, but I have been very much impressed by the success with which they have been used in Oregon and in my inaugural address to the legislature, I commended the Oregon system very strongly to their study and consideration. The adoption of these measures in any particular state is, of course, a matter to be based upon the conditions obtaining in that state. The people here are certainly justly tired of their inability to secure the fulfillment of campaign pledges because of the intervention of machine management and control, and I think the universal feeling is that it may be necessary for them to assume upon occasion, at any rate, direct control of legislation themselves."

Here we see the world of ideals combating with the world of realities in Woodrow Wilson's intellect and a mentality that was facile enough to grasp the practical means as they existed and use them, if only occasionally, to secure that which was Woodrow Wilson's hobby, "responsive government."

One of his most interesting reversals in point of view was on the question of woman suffrage. It will be recalled that in 1911, when governor of New Jersey, he crossed the continent on a semi-political trip, the purpose of which, according to those who were engineering this event, was to feel out the country on its attitude toward Wilson as a possible candidate for the Presidency in 1912. On this trip he was accompanied by Frank Parker Stockbridge, a writer, and McKee Barclay, a representative of the Baltimore *Sun*. Both of these gentlemen were of great assistance in helping Governor Wilson to meet people with whom he wished to confer, particularly the newspaper fraternity. With these

Are We Shylocks?—As the French Say

Motives Behind the Measuring of Sacrifice in Dollars—Thrift of France

By ALLAN L. BENSON

WE AMERICANS are Shylocks, the French say. They do not like it because our government has let the French Government understand that we want them to begin paying back the two billion or so that we lent them during the war. The French Government, very proud, but very poor, hardly knows what to say. Officially, it intimates acquiescence, though it actually promises nothing. Unofficially it repudiates the entire debt. The French call us Shylocks and we are beginning to wonder whether the French are deadbeats.

We are not Shylocks, of course. But neither are the French deadbeats. The French are quite as sure they are right in this matter as we are. I know this because a number of times, when I was in Paris last summer, I discussed the subject of the French debt to America with officials of the French foreign office. I don't recall that I discussed it with Premier Herriot whom I met but once, but I did have conversations about it with Count de Chambrun and other high officials of the French Ministry of Foreign Affairs. Count de Chambrun, by the way, is the great grandson of our own Lafayette. He has lately been appointed Minister to Greece.

From Different Angles

IN NO instance did I, as a visitor to France, mention the subject of France's debt to America. Frenchmen, both in and out of office, however, broached the subject to me. The matter was too delicate for me, as a visitor, to do more than listen to the French official point of view which, boiled down, came to this: "France will pay America when France's debtors, including Germany, pay her. When that will be, nobody knows."

It was perfectly plain to me, even so far back as last summer, that this was but a polite way of sidestepping the whole American claim. It has since developed that, even then, other French statesmen were telling their American friends that France would never pay America anything. The French feel that morally they owe us nothing for the reason that they fought our battles for us for almost three years before America went into the war.

It seems to me that the French, from their point of view, are entirely justified, both in seeking to avoid the debt and, in the event of resistance, in calling us Shylocks. It is equally plain that we in America are, from our point of view, justified in trying to collect the debt. The unfortunate fact is that something happened, years ago, that gave the French one point of view and the Americans another.

The first thing that happened was that, by maintaining silence when we should have been rebuking others, we permitted ourselves to be jockeyed into the position of a great national slacker.

We permitted the press and some of the public men of France and England to discuss the "tardiness" with which America "recognized her duty" in coming into the war. We permitted ourselves to be inferentially rebuked innumerable times because we were so "late" in going into the war. We said nothing when we were told that the war, from the beginning, was as much a war against America as it was against France and England.

Worse than that, when America did go to war, President Wilson placed our participation on the ground that we had been menaced, that democracy throughout the world was at stake and—it isn't necessary to repeat it all. In short, to the extent that Mr. Wilson's statements could be interpreted as utterances in our behalf, we pleaded guilty to the French and English charge of slackerism. Because nothing can be more nearly certain than this: If we were menaced in 1917, we were menaced in 1914. If we were menaced in 1914 and did not go in until we were beginning to lose hope that France and England would be able to win "our" war for us, we should indeed be Shylocks if we were now to demand that the moneys advanced to finance the fighters be repaid. Indeed, to call us Shylocks, in such circumstances, would be to libel Shylock.

Slackers and Shylocks

OF COURSE, the truth of the matter is that the American people never for one moment were conscious of the slightest guilt for their failure to enter the war before they did.

From the time the war started, the American people never felt that they were menaced and never wanted to go into it.

President Wilson, in 1916, was re-elected only because, having "kept us out of war" for two years, those who supported him believed he would keep us out of it to the end.

There is no use pressing this point further. The French and the English had gained the admission of the President of the United States that it was, in part, "our" war. The English continued, as they still occasionally do, inferentially, to call us slackers because we entered the war "so late." They, too, called us Shylocks when they came to settle, but they settled. Give the English credit for that.

But the French being by nature great realists, and, by the fortunes of war, very poor, have not yet settled, and we are unofficially told they do not consider they owe us anything. It is plain as a pikestaff to the French that they have good grounds for feeling that their debt to us should be canceled.

Of course, the French case falls at this vital point. The American people feel that France, as soon as she can, should pay the billions they lent her, because they are conscious of no debt whatever to France. On the contrary, they feel that France should thank her lucky stars that there was an America to save her from defeat.

If Americans had a sense of guilt because of the "lateness" with which they entered the war, they could not—*and they would not*—ask France to return a cent that was advanced to her.

And that is all there is to the conflict of French and American opinion with regard to France's debt to America: The French believe they did us a favor by fighting our battles for us from 1914 to 1917; we believe we did a favor to France by going into the war at all. Every American who believes otherwise thereby automatically and inferentially places a charge of slackerism against the American people and justifies the present unofficial French accusation that we are Shylocks.

The chief reason for the French being so anxious to repay as little as possible of what they borrowed from the United States and Great Britain is that their burden of external and internal debt is back-breaking. *The second reason* is that the French are constitutionally opposed to the payment of taxes. This applies particularly to French peasants. When I was in Paris last summer I read of peasants throwing a tax-collector into a river.

I asked a Parisian if there was an income tax in France.

"Oh, yes," he replied, *"but nobody pays it."*

Good Tax-Dodgers

I ASKED Count de Chambrun the same question and he had an assistant prepare for me a list of the various taxes that are imposed upon French business and French incomes. The list was very impressive. It did not touch the peasants, because their incomes are too small to be taxed, but it seemed as if nobody else in France could escape. The question as to why the French Government nevertheless remained poor was answered, however, in the total at the foot of each kind of taxation. These totals were small.

In other words, *the French are good at dodging taxes.* They apply the laws rigorously against foreigners, but laxly toward themselves. A foreigner no more than sets foot in France before he begins to pay taxes. French law requires hotel keepers to collect certain sums from foreign guests and turn these sums over to the government. The tax bears, of course, a definite relationship to the amount of the foreigner's expenditures.

The French peasants go untaxed, for the most part, because their incomes are small and for the further reason that they are violently opposed to the payment of taxes. If taxed they might become politically very troublesome.

A high official in the French foreign office said to me, with a smile: "No Jew hangs on to his money more tenaciously than our peasants."

Another Frenchman told me that he had seen two peasant women haggle for half an hour over a matter of two or three cents in the price of a chicken.

Yet the French peasant, viewed in all of his aspects, is a very admirable citizen. An Englishman—an Oxford graduate—who likes France so well that he has long lived there—once described French character and particularly peasant character so vividly that I asked him to let me sit at his typewriter and take down what he said as he said it. This is what I wrote in Paris last summer as he talked:

The French Viewpoint

"NO NATION is so well informed about international affairs as the French—and so little affected by them.

"The French peasant is essentially a pacifist. His fear of war is his deepest instinct. That is why a war occurs every generation. Most wars are made either by fear or by hatred. More wars are made by fear of war than by love of war.

"The French peasant, though himself a product of the great French Revolution, is hostile to all revolutionary tendencies. Communism in France is impossible while France remains an agricultural country. But how long France will remain agricultural depends upon factors of which the peasant is ignorant, and which may change the country before he realizes it.

"Cynicism with the Frenchman—even with the best type of humanitarian, enlightened liberal and educated—is a natural state and not an acquired and fashionable pose.

"Cynicism with the Frenchman means his philosophic acceptance of things as they are. The world as it is is the best possible world, though not necessarily a good world. The French, more than any other people, *live in an intellectual world between good and evil.* Their civilization they consider to be, without affectation and with all sincerity, the greatest civilization in the world since the Greek and, in some respects, superior to the Greek. France, to them, is the spiritual home of every liberal and of every revolutionary movement; and yet although they have been nursed in the liberal and the revolutionary tradition, they remain essentially conservative and anti-revolutionary.

"The French are not imperialistic, yet they deny the right of any other people to claim to be superior to France in any domain—military, economic, or cultural. Briefly, the Frenchman of today is the Roman of 1,900 years ago. Outside the empire of French thought and influence, the world, to the French, is a world of barbarians. The English and the Americans they consider interesting—even charming—yet nevertheless to be treated with a pitying condescension as belonging to a race gifted in commerce but inferior in culture—in short, less civilized.

"This attitude is tempered with anger when inequality of the world's exchanges appears to put France in a position of undeserved inferiority, but over this humiliation the more philosophical triumph easily.

"The art of living has been raised in France to a philosophy which, in the minds of the average Frenchman of every class—from the professor to the peasant and from the aristocrat to the small bourgeoise—places the national life of France in a category far above that of the mechanical civilization of America. France is an island, insulated from the rest of the world by a sea of infinite condescension.

Fear of Germany

"THE Frenchman is interested until he is 25 years of age in getting as much enjoyment out of the world as he can without paying for it. After 25, he begins thinking, either on his own initiative or at the suggestion of his parents, about marrying and founding a family. He then marries, not the woman of his choice but, generally speaking, the daughter of a family of his class who is able to bring to the altar a dowry equal to his own, both dowries to be invested for the benefit of the fruits of the union. By that time, his youthful emotions have been modified by his experiences and he brings to the marriage relationship degrees of wisdom and experience that make him a considerate husband, a wise father and an industrious partner in the business relationship that he calls marriage.

"There is nothing astonishing that the fruits of such unions should be equally industrious. Most French children appear to be the offspring of old or prematurely old parents. They are usually precocious and wise beyond their years."

One pities the French when one goes to France and realizes how great and how real is their fear of Germany. This pity becomes more acute when one is told that the peasants, who constitute the bulk of the population, are all but pacifists. Leon Blum, leader of the French Socialist party, which is the main support of the Herriot government, told me that fear had been "inked into" the French consciousness by the war. He said Napoleon inked so much fear into Europe that it lasted for years after he died. Present French fear is, in his opinion, merely history repeating itself.

When Wilson Quoted "If" and How He Lived It

Concluded from page 3

traveling companions he frequently discussed, in the long jumps between cities, the subjects which were uppermost in his mind, and one of these was woman suffrage.

On this particular subject, his mind had not closed. In fact, from the manner of debating the pro and con of the subject it was evident that while his tendency was quite strongly against the vote for women at that time, he was seeking light and he kept throwing out arguments for the purpose of having his companions battle the question back and forth with him.

In a subconscious way, Woodrow Wilson probably had a feeling at this stage of his career that his life had been centered in a more or less idealized atmosphere and he was reaching out for the reaction of the more real attitude of the workaday world, such as these newspaper men would know.

When he arrived in Denver, I was given to understand that his general attitude was against suffrage. As the subject was being keenly advocated in the West, I suggested in a mild way that it be not thrust into the political arena. However, this was not to be, as was soon revealed.

One of the invitations which Mr. Wilson accepted was to a luncheon where, as a guest of honor, he was seated next to a lady, then probably the most outstanding suffragist in the West, a woman of remarkable charm and attainments, who was born to leadership. The conversation between her and the Governor sparkled with repartee and epigram, and all was going nicely when suddenly she leaned over to him and said:

"By the way, Governor, for my own private information, may I ask whether you are for woman suffrage?"

My thoughts halted, fearful of the reply. The Governor, however, undaunted by the question, and with an engaging smile, said:

"Mrs. ....., since you ask me so directly and for your information, I will reply in the same manner: No, I am not for woman suffrage."

Then this remarkable woman who saw in Woodrow Wilson the possibilities of a great progressive leader put aside temporarily her feelings for the cause which was dear to her heart and said:

"Well! Governor, don't say anything about it. We are for you anyway."

It is, of course, a matter of history how gradually Woodrow Wilson, revolving the suffrage question over in his mind, finally arrived at the conclusion that the cause was a just one and became one of its strongest advocates. It is said that the influence of members of his own family had a great deal to do with his reaching this conviction.

Tastes Bitter Fruit of Her Philosophy

Emma Goldman Visited in Her London Refuge—Prefers America

By JUDSON GRENELL

"I'M GLAD to see you; I'm always glad to see Americans," said Emma Goldman, as my wife and I shook hands with her in her comfortable apartment, 3 Titchfield Terrace, London, England, a short time ago.

Emma Goldman is known to the Bolshevik in Russia, and to the police of Berlin, Paris, and London as "E. G. Kershner." The name is hers by right. Many years ago she married a Kershner, presumably an American citizen. At that time both were living in the United States. One day Mr. Kershner disappeared, and with him went any proof that he had been duly naturalized.

In those days the citizenship of the husband attached to the wife. When brought into court, Emma Goldman Kershner was unable to prove that her husband had ever been naturalized. Having been born in Russia, she was deported to that country when the court decided that she was an obnoxious foreigner.

There is a newspaper axiom, which generally works out effectively: "If you know what you want, you can find it," that is, in the way of news. Wanting to find where Miss Goldman was living, in a city of seven million other persons, I set the machinery in motion to discover her whereabouts, without asking the help of Scotland Yard, or any other detective agency.

The process was simple. Jo Labadie, Michigan's philosophical anarchist, who has shortened his Christian name of Joseph Anthony to just "Jo," had given me the address of a British anarchist friend of his, asking me to see him when in London.

I hunted up the address. It led me to a dirty street in an unfashionable part of the city. The number was over a narrow passageway into a still dirtier court. On one of the doors opening into the court was a sign cut from a newspaper heading: "F-R-E-E-D-O-M." Entering the door and going up a stairway I found myself in a small printing office, with everything in a sort of disorderly order, as if the very type and proof press and cases had demanded freedom to stand and lie around as it best pleased them.

Here was the headquarters of a group of philosophical anarchists, in touch with the movements of their traveling comrades.

But concerning giving the address of Emma Goldman to a stranger—that was something to think over. Finally, with some hesitation, it was agreed that Miss Goldman should be given our name and address, and she would write us if an interview was agreeable to her.

The very next day a note came to our apartment from Miss Goldman, stating that she would be very much pleased to receive a call from us. She had just arrived in London the day before.

Left—Emma Goldman at her writing desk. Right—The rear of one of her Paris shelters. The man in the picture is Max Nettlan, a resident of Austria.

This was not my first interview with Emma Goldman. As a newspaperman, and interested in economics, especially as affecting the social welfare of the masses, I seldom missed an opportunity to listen to her when she visited Detroit on her anarchistic propaganda tours. And when it was possible I continued my study of her and her philosophy in some nearby restaurant where beer was served, for Miss Goldman is ravenously hungry and thirsty after a lecture. To me her theory of what were proper social relations were fanciful and impractical, but I never made the blunder of thinking that she did not believe in them herself.

Much to my surprise the world-known anarchist looked younger than when I saw her, half a dozen years ago; younger than she looked when she was deported, December 21, 1919.

Europe had dealt kindly with her. Her skin had a rosy complexion, and her eyes were bright. Face wrinkles had disappeared, and her long hair, done up in a becoming manner, gave her an appearance of matronly vigor. Should an observing stranger have met Miss Goldman on a London street the day I was with her, he would have taken her for some contented German frau, with nothing on her mind more important than the proper conduct of her household and family duties.

Titchfield Terrace is a pleasant locality in which to live. London's East Side, the home of London's poor, is far removed. It overlooks the upper end of Regent's Park, and is close to the great London Zoo. In fact, so close is it that at times the roarings of the lions, the screechings of the seals, and the hyenas' laughs can be heard, mingled with those other sounds common to a locality where wild animals are confined.

Yes, as a residence district, Titchfield is decidedly middle-class. Here can be found neither the very rich, nor the very poor, and a bus line, which passes the door, will take one in a few minutes to the very heart of the city.

Emma Goldman is not averse to talking of her experiences in Russia, where she spent two years trying to reconcile her theory of what is governmentally expedient, let alone right, with what she actually saw.

"I wasn't at all averse to being deported to Russia," she told me. "In fact I decided not to appeal my case to a higher court simply because I thought I would find in Russia economic and social conditions somewhat in harmony with what I believed to be right. I did not expect to see an anarchistic society in full bloom; that I knew was an impossibility; for anarchism is a growth; it matures slowly; but I did expect to find in Russia greater freedom than elsewhere in everything that did not interfere with equal freedom for others."

"And the awakening?" I queried.

"Oh, that was a sad awakening," Miss Goldman resumed. "It slowly, very slowly, dawned upon me that in Russia there was not freedom, but slavery. Liberty? Justice? Both were nonexistent under the rule of the leaders of the Communist party. Workingmen in Russia today are more slaves than they were under the reign of the Czar.

"Think of it. Under the 'dictatorship of the proletariat' men and women are drafted to tasks irrespective of fitness or inclination. An educator, who ought to be teaching, may be sent to the mines. A mechanic may be given a task in which his skill and experience are not available. For political reasons, to strengthen the hold of the Communist party, totally unfit men are elevated to positions of power and importance. Useless bureaus are everywhere, with their miles of red tape. Grafting officials are common. Here and there have been established manufacturing plants and schools for the benefit of visiting delegations from other countries, and they are shown nothing else.

"I cannot adequately describe to you how badly everything is being done. The Marxian doctrine of the supremacy of the state—something to which I am utterly opposed—is the cornerstone of the Bolshevik rule. Everything is subordinated to this. Then the maxims 'the end justifies the means,' and 'during a revolutionary period there can be no free speech,' are worked to the limit. Everywhere you hear these dropping from the lips of high officials.

"As an example of how everything is subordinated to the idea of a centralized government, here is a fact. There is plenty of wood less than 70 miles from Petrograd. It needs only to be cut and transported to that city to supply the people there with the fuel they so sadly need. I suggested to an official that the idle men of Petrograd be employed to supply this fuel, but it was vetoed. 'Should we grant this in Petrograd,' I was told, 'the same demand would be made by other localities. It would create communal competition, which is a bourgeois institution, and it would interfere with our belief in nationalized and centralized control.'

"Were you not in government employ in Russia?" I asked.

"I was connected for a considerable time with the Commission collecting material for the Museum of the Revolution," Miss Goldman replied. "I had nothing to do with the enforcing of laws or decrees. My connection with the Commission took me far afield and gave me opportunity to talk with all classes. Among others I had a talk with Korolenko, a Russian revolutionist who has done much and suffered much in the endeavor to relieve Russian injustice. Speaking to me of the present Russian régime he said substantially that if the gendarmes of the Czar had been given the power not only to arrest, but also to shoot, the situation would have been like that at present in prostrate Russia.

"'That is what is happening before me every day,' he told me. 'The Bolsheviks claim that such methods are inseparable from the revolution. I cannot agree with them that persecution and general shooting serve the interests of the people of the revolution. It has always been my conception that revolution meant the highest expression of humanity and justice. In Russia today both are absent. A gag has been placed upon the whole people. To dare to question the wisdom and efficacy of the so-called dictatorship of the proletariat or the Communist party leaders is considered a crime. Russia will have to pay dearly for this experiment. It may delay for a long time fundamental changes in other countries. The bourgeois will be able to defend its position by pointing to what has happened in Russia.'"

Miss Goldman did not say so, but my opinion was that Korolenko also voiced her own belief.

"I cannot speak too kindly of the peasants of Russia," Miss Goldman continued. "They are unsophisticated, even crude. Suspicious of strangers, they must be carefully approached. I was successful in this by coming to them as an 'American.' Once put at ease, they will open their hearts to you. They are unspoiled and possessed of a deep faith in elementary justice and equality. Really, these Russians are a peculiar people, saint and devil in one, manifesting the highest as well as the most brutal impulses, capable of almost everything except sustained effort."

"And how about your own treatment by Russian officialdom?"

"I was at first cordially welcomed, but finally there was more or less distrust," was the response. "I received many favors; I could not have been better treated had I enthusiastically joined the governing powers. This makes it difficult for me to criticize them. Yet is not silence consent?

Noon having arrived, I invited the party, by this time augmented by a visitor from Boston, out to lunch. Taking a taxi, the four of us went to a famous kosher restaurant on Tottenham Court Road and were served an excellent dinner. Afterward we returned to Miss Goldman's apartment, where she served delicious coffee in a wonderful percolator, alcohol heated, which has been her constant companion in her European travels.

After leaving Russia Miss Goldman first went to Berlin. Here she wrote her book on her Russian experiences. From Berlin she went to Paris, principally because the cost of living in the French capital was within her means. But as conditions there were not favorable for earning a living, in September she went to London, where she was pleasantly situated at the time of my interview.

"Do you desire to return to the United States?" I asked Miss Goldman, while enjoying her coffee.

"It is natural for one to desire to be free to go anywhere," she finally answered, taking thought to formulate her reply. "I was unjustly, as I believe, deprived of my American citizenship. For this, if for no other reason, I should like my American citizenship restored to me. Besides I have a multitude of dear friends there. They understand me, and I understand them. And I should wish to tell them, face to face, why the Communist party of Russia, as now run, is impossible in a free society.

"I want all countries, including the United States, to be a land where liberty and justice are the foundation stones of a free society, where one is free to do as he or she pleases, so long as this freedom does not interfere with the equal freedom of all others."

Resuming her account of her European experiences, the past four years, Miss Goldman told of her stay in Berlin, which was the first place she stopped after leaving "impossible Russia." "At first the cost of living in Berlin was wonderfully low. I had a good five-room apartment for four dollars a month, American money, and the price of food was in proportion to the charge for rent. But finally prices took an upward turn, and before I left that same apartment was renting for $65 a month.

"Then I went to Paris, but I stayed only a short time. No objection was made to my presence, either there or in Berlin. On no occasion, so far as I know, were my footsteps dogged by the police. I was as free to come and go as was any other tourist. But I saw no way of earning a living in Paris, so I came to London. Here I expect to be allowed to work in my own way for what I consider to be right."

"To lecture on anarchy?"

"We shall see. What I desire is equal freedom, with the rest of the world, to advocate the best way in which, in my opinion, all can lead happy and peaceful lives."

Miss Goldman is "against the government"—all governments. To her, government means coercion—the invasion of individual liberty—terrorism. Here, in conclusion, one may properly quote from her published utterances:

"Today oppression and terrorism rule Russia. Tyranny is masked by a world-stirring slogan. Because I am a revolutionist, I refuse to side with the master class, which in Russia is called the Communist party."

Sherman Takes Hide Off Mr. Mencken

Unmasks "Civilized Minority" and Shows Them as Literary Mountebanks

THE juxtaposition of the two names, Mr. Brownell and Mr. Mencken, is ultimately due neither to the editor's whim nor to the reviewer but to destiny. It is symbolical. It represents what the critical effort of the last ten or fifteen years has been striving to bring to pass, namely, a confrontation of the literary aristocracy with the literary proletariat. Hope of an exciting engagement, however, will once more be frustrated, as it has been many times in the past, by the cause which kept the fight between Sebastian and Sir Andrew Aguecheek from really coming off: one of the combatants, as soon as he discovers himself in the presence of a competent adversary, ignominiously shuns the conflict, contenting himself, as he retreats, with administering a few cuffs to an unknown man who has just dashed up to the scene from Texas. Perhaps this sounds a little mysterious. I shall stay just long enough to make it clear. (I am not reviewing either of the books here mentioned but am merely discussing a point raised by bringing them together.)

Mr. Brownell is a critical representative of our literary aristocracy, and nowhere is his theory more blue-blooded than in his latest book, "The Genius of Style." By a literary aristocracy I mean that small highly civilized minority of writers who love perfection and seek it, who love truth and pursue it, who love beauty and create it. These quests are all so difficult that even to undertake them implies seriousness; to persevere in them involves fortitude and renunciations; to succeed in them denotes a fine and rare faculty, the faculty of discrimination, the talent for recognizing excellence, and a nature so constituted that the joy which it experiences in embracing the best compensates for the loss of all inferior pleasures. Since the best has no exclusive partiality for any time or land, the seeker of it, the true literary aristocrat, avoids chauvinism and the heady infatuations of the hour. Inevitably he is a citizen of the world, with the historical sense, the culture, the civility of the world's best citizens. If he often invites polemic, it is always with adversaries who use the weapons of the civilized minority and observe the code of duelists.

Though "civilized minority" is Mr. Mencken's favorite catchword, he is, as a matter of fact, obviously the critical champion of our literary proletariat; and the object of his polemic has often appeared to be the destruction of the civilized minority and the merging of all in one undistinguished rabble. By literary proletariat I mean that very large body of barbaric, uncivilized, or semi-civilized writers who shy dead cats at perfection, who like a little truth in a great bulk of libel, and who love the ugly and create it in abundance. These quests are so easy that they may be carried on with a minimum of seriousness and discrimination. For many years now Mr. Mencken has talked about an intellectual aristocracy and has given himself out as its champion. There was a time when I thought that he was a bad critic because he was incapable of discrimination. I have gradually abandoned that conception of him, to substitute for it the notion that he is a nearly first-rate all-around comedian. For to present himself as the spokesman of the civilized minority, as he does, and then to bring all the power of his example and his trenchant rhetoric to bear upon the task of teaching his fellow countrymen to affirm their ordinary selves with all their might—this seems to me the height of bourgeois comedy.

Here and there in the writings of Mr. Mencken you will find touching pages in which he intimates that he is about the only critic living who dares to tell the truth. If his courage is as great as he vaunts, it is hard to understand why he does not indulge himself in the pleasure of accurate and scrupulous veracity more frequently. Mr. Mencken talks about truth as if she were his mistress but he handles her like an iceman. The only reasonable explanation that occurs to me is his proletarian insensibility to distinctions. Like the ordinary two-fisted husky proletarian, he seems quite unable to appreciate the fact that total disregard of all the shades of truth becomes in the long run tantamount to total disregard for truth. In esthetic matters and in human relations generally, truth is not a thing to be got at with a sledge hammer or a steam shovel. Mr. Mencken seldom employs more delicate instruments than these. More and more he shuns the fine work of literary criticism: he cares to tackle nothing smaller than the devastation of a literary generation by gas attack, or the destruction or heroization of an order of society. No one who ever set up in these states as a literary critic before his time, no one, certainly, who conceived that he had an audience of civilized men to listen to him, ever attempted to get away with such wholesale misrepresentation as Mr. Mencken attempts in the opening essay of his fourth series of "Prejudices."

This essay is entitled "The American Tradition." Now it is transparently clear that what Mr. Mencken desires to accomplish by this essay is to bring the American tradition, as represented by the American Academy and in particular as interpreted by half a dozen such more or less academic persons as Mr. Brownell, Mr. Erskine, Mr. Boynton, Mr. Matthews, Professor Beers, and myself—to bring this tradition and its exponents into even greater disrepute with his readers than they now enjoy. Possibly that is a very desirable and praiseworthy object. I, for one, should be perfectly willing to discuss the matter with him. I see no particular reason why he should dread to discuss it. He is not without acumen and he has a strong flow of language. In all probability, if he applied himself to the task, he might discuss the matter very well. But Mr. Mencken with a kind of proletarian cunning and caution greatly prefers to get behind a wall and heave decayed vegetables at the objects of his aversion. Contrary to his practice, I shall illustrate precisely what I mean.

> Perhaps you have asked "What is happening to our modern American literature?" and have sometimes wondered at the alien tone of it. Stuart P. Sherman, who represents the American standard in letters, has asked the question, too, and found clues to its answer.
>
> By permission of the *Bookman*, a literary monthly of high quality, in whose January number this article appeared, THE DEARBORN INDEPENDENT reprints Mr. Sherman's estimate which adequately expresses a growing judgment of one of the "new lights." The title is "Mr. Brownell and Mr. Mencken."
>
> Mencken's absurd assumption of the championship of an intellectual aristocracy is here dealt with as it deserves and its thrusts will penetrate the unusually thick literary hide of that individual.
>
> With a deftness that Mr. Mencken must envy and a plain labeling of things which Americans will applaud, Professor Sherman performs a duty to deluded Menckenites in particular and American letters in general.

He begins his essay in the following fashion:

"Ever since Dr. William Crary Brownell, *de l'Académie Américaine,* published his little volume 'Standards' in 1917, a vast hullabaloo has been going on among the native, white, Protestant *Gelehrten* of the Republic, particularly in the open spaces of the South and the Middle West, in favor of what they call the American tradition in letters. Perhaps I libel Brownell, a worthy if somewhat gummy man, by hinting that he started this whooping. . . ."

Now Mr. Brownell has published a number of books, including "Standards," thus thrust into the front of Mr. Mencken's two-fisted essay in fustigation. These books of Mr. Brownell's are not "out of print." They are accessible to the public. If Mr. Mencken has any appetite for the truth about Mr. Brownell's position, he is quite at liberty to discover what it is, and whether he has libeled Mr. Brownell. But no, Mr. Mencken backs circumspectly away from that dangerous quarter, without adducing a single sentence to justify the overture to his essay. He backs away from the real object of his assault and backs into an obscure article by a Mr. Doughty, of Texas, dealing with current literature. That article he describes in detail and deigns to quote from freely.

It does not appear to have been written with great delicacy. It has, indeed, something of that over-robust manner which we have come to associate with Mr. Mencken's own disciples. Mr. Doughty is quoted as characterizing the current American literary product and its producers as "swept-up rottenness and garbage," "a horde of chancre-laden rats," "a devil's crew of perverted drug addicts," engaged in a "flabby and feeble assault . . . . upon that ancient decency that for unnumbered generations," and so forth. In brief Mr. Doughty maintains, thus Mr. Mencken concludes his report, "that the whole movement is no more than a foul conspiracy to tear down the flag, uproot the Republic and exterminate the Nordic Blond, and that, in consequence, it is the duty of every American who is a member 'of a white Nordic race, save the Teutonic' to come sliding down the pole, grab the tarpot, and go galloping to the alarm."

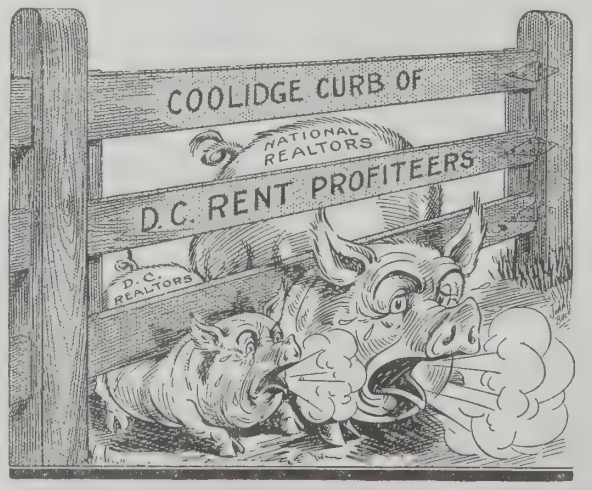
Not having read Mr. Doughty's discourse myself, I have, of course, not the slightest notion whether Mr. Mencken has correctly represented it. Mr. Mencken boasts, with obvious reason, that he is quite above any such petty business as faithfully interpreting another writer. No one, so far as I have heard, has ever charged him with any such picayune performance. But that is not now the point. The point is that immediately on the conclusion of this summary of Mr. Doughty's views, Mr. Mencken remarks: "The doctrine thus stated in harsh terms by the dreadful Doughty is, in its essence, precisely the doctrine of his more urbane colleagues—of Brownell *de l'Académie Américaine,* of Brander Matthews *de l'Académie Américaine,* of Sherman *de l'Académie Américaine,* of Erskine *de l'Institut National,* of Boynton, of old Beers, of all the rest."

If this is to be regarded as some of Mr. Mencken's fun, very well, let us all laugh, and magnanimously concede that his comedy not infrequently rises to a higher level. But if one is really asked to regard such stuff as criticism, if one is asked to regard such tactics as sportsmanship, then one must be allowed to observe that our "spokesman for the civilized minority" has here been moved by "the eternal spirit of the Populace." My own growing suspicion is that, despite all his professions of tough-mindedness, despite his oft-avowed joy in glorious battle, Mr. Mencken is at heart a confirmed pacifist with as profound a distaste as Sir Andrew's for cold steel.

The President Attacks the Rent Hogs

Initiates Bill to Fix Fair Rentals in D. C.

WHEN Calvin Coolidge was elected President of the United States his legal residence was one-half of a double house in Northampton, Massachusetts. The rent was $32 a month. As Vice-President he lived with Mrs. Coolidge and their two sons in a Washington hotel suite;



they could not afford to rent a house. As the President, Mr. Coolidge doesn't pay rent, of course, but he hasn't forgotten the viewpoint of the rent-payer. Washington real estate dealers discovered that fact recently when Mr. Coolidge sent to the House of Representatives and the Senate the Whaley bill, together with a letter recommending its passage.

This bill, if enacted into law and upheld by the Supreme Court, will give a commission of the President's choosing the power to determine fair and reasonable rentals for apartments and dwellings in the District of Columbia. Among other things, it declares that all such buildings are "clothed with the public interest." In other words, President Coolidge, aware that rents in general are burdensome to government employes, with their small salaries, has decided that Washington rents must come down. The President's rent control bill isn't yet through Congress, but it is evident that he has started a housecleaning in the real estate business at the National Capital. He is also setting an example for state legislatures throughout the country.

Most of the government workers in Washington are tenants. And rents in most apartments and dwellings are now approximately 100 per cent higher than they were eight years ago. Mr. Coolidge realizes that if this condition is not remedied, there is likely to be a general demand by government workers for higher salaries, which, if granted, would put a dent in the Coolidge economy program. Moreover, the President knows that if the government is to get efficient service from its employes, it must see that they live in fair circumstances at moderate cost.

Washington differs from any other city in the country. It is a Federal District, in which Congress is supreme. No other city will be directly affected by the passage of the Whaley rent control bill, for no other city has such a paramount interest in the government. The precedent created, however, is sure to have an indirect effect upon the entire country, for landlords, in league with bankers and real estate dealers, have in the last few years evolved a popular indoor sport—that of "pyramiding," by means of fake sales to dummy purchasers, the value of a building. By doubling the paper valuation of buildings they "justify" a similar increase in rentals. This practice has been so flagrant in Washington as to attract the attention of the Executive, who believes that the rather drastic action he has taken is essential for the welfare of the government itself.

We have read a great deal in recent years about the police power of the states. The government has a similar power in the District of Columbia. Several states have enacted rent control laws as drastic as the one which President Coolidge now sponsors; the government has the right to do likewise, for the District of Columbia contains the seat of government and because much of the land within its borders is devoted to government use. The national interests are paramount. And one of the government's first duties is to keep the city a fit place of residence for Washingtonians in general, and government employes in particular. Such details as the regulation of real estate rentals, therefore, become a legitimate exercise of the governmental police power.

—Burt M. McConnell.

Mr. Ford's Page

PROGRESS is measured by the ambitious according to the increase in opportunity which it brings; by the vegetative according to the amount of ease and comfort it permits; by the contemplative mind according to the number of the problems it creates; and as it rarely occurs that any mind is destitute of all these qualities but possesses more than one of them in some degree, it comes to pass that mankind is alternately praiseful and critical, sometimes fearful and sometimes boastful of Progress.

What we call the problems of progress may be its poisons, or its good fruits; we should arrive at some clear conclusion which. Progress has its price in change and struggle, but this is also true of life; and nothing is more evident than that there is often change and struggle that does not spell progress. And there is a Progress that does not progress, but seems to go backward, which is really fruitful in the regathering of experience once passed through but not absorbed. Progress is a mystery, and for that reason the few items we may assuredly know about it should be known through and through.

It is clear, for one thing, that we are not the only race to experience progress. The remains of our early predecessors on the earth indicate that some of them outdistanced our present record in certain fields. That is, in what they *knew*. They discovered facts and made knowledge. They seem to have discovered some facts that are yet beyond our most eager grasp, and to have made a knowledge the most distant confines of which are not yet within our vision.

Yet they are gone. They left nothing, hardly the memory of their names. They passed on no torch, not even an improved plot of ground. "Our debt to the past" does not run as far back as our knowledge of the past; if there is any debt it is the past's debt to the present for giving it life again in human thought.

What we know is this, their progress did not save them from extinction; their progress did not serve to thrust the world forward. All their glory is like their works, forgotten dust.

Another thing we know is that the glory of progress is not ours, but something not ourselves that enables us to go on. There is a sometimes amusing and sometimes pathetic element in the airs which man takes to himself upon making a discovery. Now, discovery is the simple act of seeing what is. It is simply coming to be conscious of what was there all the time. In a baby we call it "taking notice." Man is beginning to "take notice" of the things in the Room of Life in which he finds himself, and one measure of his babyhood is the number of things he does not notice as yet. But *the* measure of his babyhood is the manner in which he plumes himself on his discovery, as if discovery were creation!

Take the atom. It is one of the big things in what we call the invisible world—that marvelous world which our eyes are too clumsy to behold. Well, the atom has always been there. In the atom we come near that dim transition ground where what we call matter is in contact with something for which we have no such definite name. And we are vastly interested in all these efforts to see what is there—but, after all, what is it but perceiving that which we have nothing at all to do with, so far as the creative glory of it goes?

Strictly speaking, man has contributed nothing whatever to progress; yet he has a tendency to take all the praise for progress having occurred. Man created none of the elements on which progress is based; he formulated none of the laws, a knowledge of which enables us to see where progress is moving; and he created none of the faculties of mind or personality that becomes the tools or vehicles of progress. He contributes nothing—not even the urge to know is his; although it may be said that the *will to use* his faculties may be his own, and to be credited to him. Everything that we have, whatever its latest and most amazing combination of forms or element, was here all the time. We made nothing. But in these our first waking periods, we have "noticed" a little, and have even reached out to touch a little. All the stuff of progress is outside our sphere of boastful pride.

A third thing of which many are becoming more convinced in their thought about this matter is that progress is not so much an achievement of man as an intellectual entity, as it is a test of man as a moral being. The progressive civilizations of the past, why did they disappear? Did their physical vitality fail? Did their intellectual life, like a flower, come full bloom and die of the effort? Is there a law that civilizations shall rise and fall, that races shall come full circle and disintegrate? Apparently there is no such law, and those who assume it take far too much for granted. Occurrence in the past is no warrant for repeated recurrence in the future.

The point to which attention is increasingly directed in ancient civilizations is *the use that was made of them.* Progress was assuredly given; *what use was made of it?* Power was given; *to what end was it used?* Wealth was accumulated and widely distributed; but to what ministry was it devoted? Knowledge is wrested from mystery; do its possessors use it to further liberate or further bind men? These elements of progress were all present in ancient times; *what was done with them?*

These questions open up the court of history's judgment hall. We know something of the case that was tried there. The elements of Progress were all given to some of the ancient peoples that were ready for them, but the use they commonly made of them was to exalt human pride, establish tyranny, enslave poverty, further degrade human deficiency—in brief, to call all Progress *gain* and call none of it *responsibility.* Their failure was not physical, as a race; not political, as a nation; not scientific, that is, it was not because of their inability to learn and use; *their failure was moral;* they used their Progress to develop further those social evils which in the end are destructive of the society that is deceived by them.

Now, if this is true (and full consideration will dispose the mind to favor it), then Progress is moral. If there is no moral progress, there is no Progress at all. If it can be said that Progress has a purpose, that purpose seems to be to test man's reaction to it. We have ample grounds for saying that it is man's immoral reactions to Progress that changes his progress to be his doom. A primitive society undergoes few of the tests that a progressive society has, and it is the progressive forms of society that furnish the larger number of failures.

It is safe—in the prudential sense, anyway—to say that our modern progress is the test of our ability to attain a moral greatness equal to our other achievements. The lack of balance between a people's *power* and their *justice,* between their *knowledge* and their *wisdom,* between their ability to *accumulate* possessions and their ability to *use* them wisely—it is that which causes downfall. The downfall is therefore perfectly natural; it is not retribution, it is simply failure to achieve normal conditions. Justice is the normal condition of power.

We *are* using *our* power with a larger admixture of justice, we are extracting from our knowledge more of the essence of wisdom, we are using our progress for liberation rather than for bondage, in greater degree than any civilization that has preceded us. To the degree that we do this, we lengthen the life and justify the existence of the worthier elements of our civilization.

IS PROGRESS a poison thrown off by the action of life, to which man must be immunized? Is it the fine fruit of the human spirit? Or is it a test of humanity's fitness to survive? Each of these views of progress has its apostles. The first offends reason and ends in pessimism. The second incites to boastfulness and tends to littleness of mind. The third has at least this mark of truth, that it compels a broader view and a more wholesome attitude. Progress is the greatest test any civilization has confronted, and most of them have fallen before it. Progress is a gift of material power and requires a moral development for its government and use. Power without justice passes away. Progress unmixed with moral responsibility ceases. The fact is fairly clear. Human advance is governed in the end by right use of what is won.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Not Necessarily Alarmists

FROM the beginning of the world there have been men who have scoffed at the possibility of danger. From the destruction of Sodom and Gomorrah to the outbreak of the Great War scoffers at warnings before the event have considered themselves wiser in their generation than "the children of light."

Face to face with the poignant facts of the still quivering past, it ill becomes public officials to enact again the role of "foolish virgins" which made European statesmen the dupes of folly. The literature of forewarning concerning the Great War was very full and may still be read, men of vision jeopardized their reputations by adding their voices to the solemn warning, but the "blind guides" of the people said: "Peace, Peace; these be but wild tales," and so the nations walked unprepared into the ghastly surprise of war. Everything was foretold; nothing was believed by the destined victims.

It is therefore somewhat disquieting to read in the papers that Secretary of the Navy Wilbur has characterized present-day warnings as "bedtime bogey stories." So did Lloyd George before him when Lord Roberts was foretelling the German attack. So did fatuous British editors when Maxse was writing his now literally fulfilled prophecies based on long-continued observation and amply confirmed facts, yet British editors set him aside as a calamity monger. However, the leaders were wrong and the prophets were right and two-thirds of the toll of war was paid, not to militarism but to pacifism, not to preparedness but to unpreparedness.

Therefore who shall say that the prophecies of poison gases far more deadly than before, of disease germs that carry death in their train, of engines of war more terrible than has ever been dreamed of are "bedtime bogey stories"? Who will seriously believe that informed investigators seek to terrorize the people merely for the sake of terrorizing them? The thesis that some of our most able technicians and publicists are so many Dickens' fat boys trying to make the people's "flesh creep" is most futile and nonsensical. It is equally futile for Secretary of the Navy Wilbur to say that "to have a war one must have a defense and that the means of defense should be commensurate with the offense." If he is quoted correctly, his words come near to being meaningless. Belgium had no defense, yet Belgium had a war. Adequate defense is only possible when the nature of the attack is known in advance. In modern warfare the nature of the attack is usually known only to those who are dubbed calamity howlers and makers of "bedtime bogey stories" for their pains in telling us what the nature of attack is to be. What is wanted are means of defense up to the limit of intended aggression, and this cannot be attained without full discussion of every possible contingency.

The "Debt" Is Wiped Out

THE President has pricked one bubble that has floated too long—the bubble of our debt to France for Lafayette. President Coolidge informed the French Ambassador that the debt has been paid. So that should be the end of that. In view of the insistence with which that gratitude gag had been worked, to lure us to war and to cheat us of peace, to get our money and befog repayment, it was about time that something definite was said, even if it seemed harsh.

In strict speaking, the President rather stretched a point when he assumed that there ever was a debt. Lafayette was better treated in America than in his own country; and but for the reputation given him here, his reputation in France would not have been lustrous. Lafayette owes America a debt of thanks for preserving his name. And we on our side have long since forgotten with what effort the infant American republic disentangled itself from the hold which French republican freethought tried to fasten on it. Our debt, in truth, dwindles until it seems there was no debt at all. Yet, such is the power of a reiterated slogan, "our debt to France" has more or less confused our thinking since 1914. Not that America is sorry for what she did. But she is not asking any European country to "remember the debt to America" in a sentimental sense. If Europe is not aware of any debt to us for the help we gave, certainly we shall never be crude enough to insist on it, even though we are rather short on "European politeness."

Get the Facts

THE controversy between aircraft men and naval men has reached the liar stage. Either Brigadier-General Mitchell has talked very loosely, or the naval men have departed from their long-established standards of rectitude. The claims of the airmen in the recent tests were denied by the navy's reports. The claim is now made that something was wrong with the conditions set by the navy and with the reports. These things are difficult to believe, and will not be believed until they are established by more than individual say-so. But because the controversy has been able to enlist so many relay stations, steps should be taken to determine the matter of fact at once. If our navy is preventing the arrival of a new and necessary arm of defense, we want to know it. If interested parties have not scrupled to attack the honor of the navy, in an over-zealous effort to forward their own ideas, we certainly should know that. Let the investigation go on. Put a few hard-boiled civilian business men on it who will choke forth the reluctant facts, whatever they may be.

It Is Done, But Not Forever

IN WHAT guise it may now be impossible to foresee, but certain it is that the action of the Republican majority in disciplining a minority because it criticized the party will come back to plague it. Strength always has its weakness, and the indication is that the weakness of the present administrative power will be exhibited in personal suppression of independence. There is no question whatever of the *right* of a party organization to do what it pleases within its own partisan organization, but there is a very large question about the *wisdom* of some things which are done. And when the action takes the form of preventing legally elected representatives of the people from taking their full share in the work of the government, it becomes serious. There is now no doubt of Republican intention and Republican agreement on what has been done. Let the matter therefore be filed away with a note attached: "Observe in what manner this returns to notice." Power misused is strangely thwarted by unexpected occurrences.

A Triumph for Golf

ANOTHER triumph for golf. The Lord's Day Alliance, in a bill offered to the New York legislature to ban various commercialized forms of Sunday amusements, have made an exception in favor of golf. Thus is the royal and ancient game lifted above the common rut of box-office sports and pleasures; but "the employment of caddies, attendants and other help about golf links" is prohibited.

In that land of "brown heath and shaggy wood," which is the ancestral home of golf, certain ministers and elders o' the kirk strengthen their lungs and clear the cobwebs from their brains by a round or two of the links, even on the Sabbath, and are regarded by most people as the better for it; and this apparently is the view taken by the Lord's Day Alliance of New York.

There is as yet no word that the inventor of golf has been canonized. Probably this is because he lived in such a remote antiquity that he antedated the Christian Era; but if some day his bones are miraculously discovered beneath some sod-covered mound when a new hazard is being dug, there is no doubt that a strong effort would be made to have the word "blessed" put before his name at least.

After all those apocryphal tales about golf as a begetter of profanity on such occasions as the "foozling" of a ball or the missing of a short putt, it is refreshing to find that the game has retained reputation enough to be given a Sunday bill of health, as it were, by such an influential body. It should serve to make clear to the public that the agitation to preserve the American Sunday is not the labor of "kill sports." Infringement of freedom of the people in the open is not in any contemplated plan. But the rank prostitution of the day to alien commercial interests is sought to be curbed—which is eminently proper.

Inauguration Simplicity

THE decision to keep the Inauguration as simple as possible has nothing to do with the ceremony itself, which is the essence of simplicity. The election of a president being certified, he is sworn into office upon the expiry of the preceding term, and that is all there is of it. It may take place in the front parlor of a Buffalo residence, as did Roosevelt's, or in a Vermont farmhouse as did Coolidge's. The rest is all extraneous and save when it is the spontaneous ebullition of a people's rejoicing it is apt to become showy. Of recent years it has degenerated into sheer commercialism.

Still, there is value in public demonstrations of loyalty and rejoicing. The Fourth of July was once the occasion of great national recollection of American history and American principles; and the Inauguration was once an occasion for the American clans, the States, to gather about their chief. But until the spirit returns, the picnic atmosphere of commercialized trivialities will remain. And it is just as well that they have as little government countenance as possible.

Washington is open to all who wish to attend the Inauguration. The central event itself will be in no way diminished. All the high dignity required by the induction of a Chief Magistrate into office will be observed. There is really no reason why Washington should have fewer visitors because the gewgaws are cut out.

Publicity or Propaganda

DR. H. E. WOOLEVER, a Methodist syndicate editorial writer, in a recent letter to his readers regarding the Child Labor Amendment to the Federal Constitution, has passed the line of fairness.

"The only opposition," he says, "comes from sources interested in cheap labor and those opposed to popular education."

It is such statements as this that have destroyed the influence of the clergy in public matters these recent years. They are the mouthpieces of certain standardized opinions supplied to them wholesale by propagandist distributing centers, and being only mouthpieces their service consists in noise and not in power.

In the case of a man like Dr. Woolever, whose position gives him space in a hundred or more Methodist papers (a centralization which Methodism will have cause to regret and change ere long as contrary to its genius) this traffic in propaganda is reprehensible.

There are three considerations he misses: first, the rising tendency to dent the Constitution at every opportunity. The Constitution defines and establishes the sovereignty of the States, and this amendment attacks that sovereignty. Worse than that, it attacks sovereignty on the false assumption that the States have failed in the duty which the Amendment would pass on to the Federal Government. Of 48 States, 46 have stringent child labor laws. All the States have stringent school laws. Eight States fix the school age at 18; five at 17; twenty-eight at 16; one at 15, and six at 14. The States have done their duty, but their duty does not provide for another Socialistic Bureau at Washington, hence this new attempt at Government by Amendment.

Another consideration is the child. Loafing has come about too widely through our national prosperity, to be further encouraged by law. The boy and girl under 18 have the right to begin their career without an American law curtailing their liberty. There is no useful American today who would not have been handicapped by a legal barrier against initiative in his youth. This Amendment *does not regulate child labor* as its proponents with knowing and deliberate misrepresentation assert; it *regulates the child.* It gives the child over to the United States Government until he is 18.

It is quite easy to succumb to angry indignation which Americans feel at such a suggestion. But, there is a third consideration: this Amendment's proposal will never come to pass. Easy-going legislators may pass it, just as easy-going clergymen may indorse it, but it will be a dead letter in the Constitution. And it is playing into alien and revolutionary hands to fill the Constitution with dead articles that inspire disrespect in the people. This country has too many undigested Amendments as it is.

The opposition to this Amendment is not fostered by those whose interest is in cheap labor, as Dr. Woolever misinformingly says. The opposition is from those whose interest is in Home Rule, in Constitutional integrity, in the liberty of initiative in American youth, and in keeping the country as free as possible from an overloaded, incompetent and too easily handled centralized control.

In an Oxford College

Magdalen, Where Medieval and Modern Meet

By W. TEIGNMOUTH SHORE

DRAWINGS BY L. PERN BIRD

The Tower, Magdalen, from the Cherwell.

WHAT about Oxford? Matthew Arnold wrote that it was "the home of lost causes," or words to that effect. So is everywhere. But more so almost than anywhere else is Oxford *the birthplace of new causes;* some of them stillborn, some rickety; some of them dying young; some few growing to maturity and power. This is natural, for where youth is gathered together there are the foundations of the future well and truly laid.

This, and much else, thought I, as I wandered once again down the gray High street. To me there is no more beautiful Main street than this and no city more lovely and lovable than Oxford. By Jove, it is more than forty years since I first paraded here, as young then in body as I am still at heart; a well-conceited youngster, but hiding shyness beneath a bravado mask of cocksureness. Much of the arrogance of young folk is armor for diffidence. But, Lord! it is as if it were yesterday that I bought my first cap and gown off an obsequious tailor, and, that I might not be recognized and smiled on as a freshman, promptly tore my gown up the back and smashed the corners of my cap. But none the less was I smiled at!

This half-sunny, half-cloudy day I set forth from my hostelry, The Mitre, a house of great age and equal repute. The High, as is all Oxford, is a mingling of old and new buildings, the latter with few exceptions being abominable in design and built of a hard stone that even this damp atmosphere will not weather or molder. There, opposite the hotel, is the new front of Oriel, erected out of the funds left to that foundation by Cecil Rhodes; alas, neither fire nor earthquake are likely to come to destroy it!

By the way, we speak of Oriel not of Oriel college, and so with all colleges except New, which from the lips of the seemly always receives its full name, New College, though it is really very old. Oxford, the university, consists of various colleges and halls wherein the particular dons reside, unless married; also the undergraduates for usually their first two years of residence.

I refuse, however, to be guidebookey. I am out for a ramble to please myself and my comrade, whose first visit it is. The gray-green city is not for the sightseer; that way you cannot learn to know her, or to love her. Wander aimlessly about her broad and her narrow ways, following the mood of the moment; loitering here, lingering there; thus shall you absorb her atmosphere and be taken to her heart.

Therefore, we vagabondized; pausing for a few minutes to look at the memorial to Shelley that adorns University (college), from which he was "sent down," that is to say, was dispatched into outer darkness and disgrace, because of his wanton atheistical ways. There he is now counted as one of the greatest of her sons. So wags the world away!

Passing old buildings and new, until we stood in the shadow of the tower of Magdalen, pronounced "Maudlin," why so, nobody seems to know. Tall, graceful Magdalen Tower, from the top of which on sunrise upon May Day ring out the clear notes of the famous choir, singing a Latin hymn to the Trinity. Well do I remember sitting through the last night of a very chilly April and then in the cold misty morning standing in the High, awaiting the sound of the voices from above and the watery sunrise. Then back to my rooms, to coffee and to bed!

Beyond the tower is Magdalen Bridge, across the sweet waters of the Cherwell. Over this bridge a century ago most men made their way into Oxford atop the coaches, accompanied by jangling-tingling of harness and too-tootling of horns. Today we mostly approach the mean modern side of the city by train.

My friend and I had but two days to spend in Oxford. I told him we would wander about, seeing "bits" here and there, and would explore one college as thoroughly as we could. For this purpose I selected Magdalen, of which I am not a son but a lover only; who could harden his heart to her enchantment, the most beautiful of all places here or elsewhere?

Desiring to ramble about at my own sweet will, unhampered by an official or by any sort of guide, I called upon a don, whom I had known in the golden days long ago. We are gray-headed now. What matter? We chatted gaily; today faded away, the past became the present; he once more a young don and I an undergraduate. He said we might go where and do what we liked; to the full we availed ourselves of his kindliness. It was the long vacation, early in September; most all dons and undergrads "gone down." But there were tourists galore, many of them Americans.

In plan the typical Oxford college is either on the lines of a monastic building or of a lordly Tudor mansion. There is a quadrangle, or "quad," which sometimes is a cloister, a chapel, a hall, a library, the house or the apartments of the head of the college, who at Magdalen is called president, and the rooms in which dons and undergraduates reside, generally consisting of a sitting and a bed room.

In vacation Magdalen is a home of ancient peace; during "term" it is an abode of busy youth. My friend could not grasp this to the full—this silence here; but it hit me rather hard, for I recalled many merry days and nights I had spent here when "all the world was young." But I did not allow the faint perfume of the past to fret me; I renewed my joy in the glorious buildings and their lovely setting. Gray, green Oxford!

We looked at the quaint open-air pulpit, where on Saint John the Baptist's day is preached a sermon, rain or shine.

We visited the chapel, much and sorely restored, but still very beautiful; dim lit and colored with "storied windows richly dight," the brass eagle lectern standing out a splash of sunshine amid the dusk. All is silent save for our chastened footfalls; I cannot, dare not, attempt to describe how different all is when the organ and the choir make music, the seats are filled with old and young, and the candles shed soft light that seems to make the darkness above a mysterious immensity.

The kitchen, Magdalen.

Then into the cloisters. In monastic establishments the cloisters were the center of business and work; in an Oxford college they are a thoroughfare, never greatly crowded except before "chapel" and before dinner in hall, when in couples and triples men stroll around, gossiping. These cloisters date from the latter part of the fifteenth century, and are among the most lovely stone things in the world. Stand on the north side, look through the gray unglazed windows, across the green grass, close cropped, at the battlemented south side, above that the windows of the chapel and the hall with its delightful oriel window; above them the worn pinnacled buttresses; and the great Tower presiding in dignity over all. Cold words these and hopelessly inadequate; but was there ever writer save John Ruskin who could paint Oxford in words? No more can a black and white drawing. Walk with me next to the eastern side; look over at the stalwart mass of the Founder's Tower, partly creeper clad, wholely impressive. Trespass a little way onto the grass, and glimpse up at the series of grotesque figures that stand on top of the cloister buttresses; set up there four hundred and more years ago; most of them looking uncommonly like bad dreams; battered and worn; their significance subject of controversy: some of them allegorical, some heraldic, some—only their carvers could tell us what!

A corner of the hall, Magdalen.

Many illustrious personages have walked and talked here in these shady ways; I don't know that there are very many of them that I would have cared to meet and greet; certainly not James I, his Queen and rather too admirable son, Prince Henry; or Thomas Wolsey, Cardinal, and founder of Christ Church in this university; or Dean Colet, who I rather fancy was a bit too schoolmasterish for my liking, though I should have loved cracking jests with his friend Erasmus. But I do regret not having held converse with Joseph Addison, perhaps after a bottle—or two!—of good port wine talking of Sir Roger de Coverly, or with Charles Reade, if he were in good humor, writer of the finest English historical romance, "The Cloister and the Hearth."

Out of the south walk of the cloisters open the Fellows' common room and the hall, in both of which we shall be wise to linger. The former a gracious, comfortable chamber; with dark paneling and dark portraits; outside the sun blazing. Here after dinner in hall do the dons foregather, comforting their inner men with wines and other liquors. In the days that are gone, when to be a three-bottle man was a distinction, they were not so sober as they are today when it is the feast of reason rather than the flowing bowl that here attains.

Open-air pulpit, Magdalen.

Here is the menu of a typical dinner as served at the High Table in the hall: "Crème Marie Louise; Sole Cardinale; Sirloin of Beef, Légumes; Péche Melba." And here one which shows the Spartan fare allotted to the members of the college eight when in training: "Fried Soles; Noisettes of Veal, Légumes; Sago Pudding, Compôte of Fruits." Poor fellows! Happy fellows!

I sat at another table in the empty hall, while my comrade sketched through an open panel in the oriel window, looking over the roofs of the cloisters at the Founder's Tower. In the center of this window are portraits of Charles I and his Queen, which escaped the attention of the irate Roundheads, who wreaked some mischief here when they were in power. To Oxford the King came after his mishap at Edgehill; his ordnance and guns were "driven into Magdalen College grove," where now the deer quietly browse; he begged and got from the college almost all their splendid plate to be minted into very necessary cash. Later, the King and Prince Rupert from the roof of the great tower watched the movements of the Royal forces as they maneuvered against the enemy outside the city walls. But I did not worry about dead kings, queens, princes, princesses; or even about dead doctors of divinity and other matters. Not a bit of it. I did think of many nights, when a guest here I sat at these tables; eating, drinking, laughing, jesting, taking no thought or care for yesterday or tomorrow, sufficient for the day being the joy thereof. Out of that past came echoes of great merriment and the memories of great friendships. There is one fault only to be found with the days of one's youth at Oxford; they never will be equaled; they cannot come again. Youth! Health! Friends! Carelessness! Are not these the chiefest ingredients of happiness? Who knows of any better?

We went into the ancient kitchen: immense, heavy tables, a huge pestle and mortar, splendid spits, pewter dishes centuries old, dish covers of famous Sheffield plate, copper pots—a wonderful cookery battery for turning out the hundred and fifty dinners daily served in "term" time.

Out again into the sunshine; strolling along the walks, which encircle the island meadow made by the waters and backwaters of the Cherwell; shadowed by trees and innumerable shrubs, overlooking the green shaded river. A fairyland of green, brown, yellow, golden—aye, golden—leaves. Through the thick branches I gazed at what I think the most beautiful view of Magdalen Tower.

My friend had been almost annoyingly silent; asking a few questions; making no comment. But at last, as we stood here, he looked up and said: "This is great."

The Founder's Tower from the hall, Magdalen.

Nature Does Not Favor Easy Jobs

And Flowers, Insects and Animals Teach Us Lessons in Efficiency

By ROBERT SPARKS WALKER

THE twenty-one years that I was editor of a horticultural magazine brought me in touch with many people, who each year became greatly alarmed over the appearance of some insect, or fungus pest that threatened the destruction of the fruit and vegetable crops. In meeting with many growers, it was not always that my optimism was rewarded with a hearty response. But one thing I learned was that when given a peaceful sea, man is by his very nature a very lazy creature!

As a general rule, man dreads to face new problems. Growers of fruits and vegetables naturally fear new diseases. After years of fighting insect and fungus enemies, I am compelled to say that thus far the most of the crop pests have proved a blessing to the human race, although it is to be admitted that they have destroyed their millions in food products!

As human beings, we are prone to overlook the fact that man progresses only as he is able to conquer nature. Therefore, were it not for so many of these pests which both laymen and scientists have branded as serious, man would have grown stupid instead of alert, shrewd and efficient. What few unconquered pests remain are here and uncontrolled because man has yet to go farther in his scientific thinking and research. The fact of these pests being here will push mankind farther into the field of conquering knowledge.

Nature, examined from one angle, seems to be very severe and unmerciful. She takes good care of the infant, whether it be plant or animal, but as soon as its infancy is past, she casts it into a whirlpool seething with diseases and dangers, and it must struggle hard to save itself. All this is necessary for the preservation of the species, for in the triumph over dangers comes a victory over the extinction of species.

Nature does not favor easy jobs. She abhors walkovers in every game in life. She has so impressed her creatures with this one fact that they do not take risks in providing for the safety of the next generation. Yet, there are some marvels in the stunts that Nature cuts which may well be characterized as haphazards. We find this well illustrated in the fertilization of the flowers of the common eel grass. In this common aquatic plant, the male flowers are borne near the base of the plant, deep under water. The foliage is also submerged. The pistillate, or female flowers, are borne on the tips of the spiral stems which lengthen at will, as the water grows deeper, and they coil up as the water grows shallow, thus making the flower that floats on the surface comfortable at any depth.

Consider the Orb-Weaver

THAT the eel grass may multiply, and that its race may prosper, the pollen that lies at the base of the plant must come in contact with the pistillate flowers that float on the surface of the water. Nature performs an interesting feat here. When the pollen has ripened down in the water, and the pistils that float are ready to receive it, the submerged male flowers break off and float to the surface. The wind blows the loose flowers round and round the female flowers, and the pollen grains are scattered on the pistils. Some stunt!

Compare this haphazard method of fertilizing wild flowers to the large orb-weaver mother spider, who spins a silken bag for holding her eggs. Then a gauzy layer of webs to keep out the heat, cold and moisture, and finally a large balloon-like covering for the whole, which is waterproof, frost-proof, storm-proof, fool-proof! This she ties on the side of a building, or else she anchors it securely to a limb. She knows enough not to fasten it to a leaf that will tumble to the ground when frost comes. But she has not finished the job yet. Her dying moments are spent in spinning and stretching a barricade around the precious treasure, that the vilest enemy will find it difficult, if not impossible, to reach her eggs. She pauses over the finished task, and doubtless believes that when the next season comes her babies will march out healthy, strong and alert. Worn out, she takes a last look at the silken bag and barricade, and then falls exhausted to the ground, a dead mother!

The Hog as Co-operator

IN THE close study of certain animals, very little difference is to be observed between their habits and man's. They think, they plan and execute, all to meet their immediate and future needs. The hog looks to his immediate needs, and sometimes becomes expert at finding food. The dog will not only provide for today, but will build a cold storage plant to preserve his perishable foods for the future. In fact, the dog built and operated cold storage plants long before man had the conception of such an enterprise! If man had heeded the example of the dog, fruits and vegetables would have been put on cold storage decades before the practice was begun.

Let him who believes that a hog does not think, give these noisy four-legged friends another chance. When I suspended a smooth, round watermelon to a swinging limb of a tree that was growing in the middle of a pen occupied by eight good-sized hogs, each one made a dash for the tempting refreshment. As each hog tried to bite the melon, it slipped from his mouth and came bounding back with such force as to give him a hard thump on the head. They finally gathered in one corner of the pen with eyes firmly set on the elusive melon. The next effort was a concentrated one: Each hog had been guided by a selfish or "all-hog" motive before, without securing satisfactory results. Now they were going to co-operate, and when they surrounded the melon and came together in a body, the melon was crushed and each hog received his share. How long were men learning the advantages of co-operation?

Hogs have conservative ideas. They conserve strength, too. It is true that a hungry hog will sometimes dig a hole in the ground his full length, and more, to obtain a small edible tuber or root, but nevertheless he has some good ideas of what conservation means. As an illustration, I know a certain farmer fruit-grower, who lives in the Cumberland Mountains. He keeps many hogs, some of them being the old-fashioned patriotic breed known as razorbacks.

This fruit-grower's house is inclosed in a fence set within the hog ranch. In his own scheme to conserve time and strength, he has suggested to the hogs a plan for utilizing that of his own as ingeniously as he himself employs it. So that he may know at all times the whereabouts of his grunting animals, he keeps a cowbell strapped to a lank long fellow, whose name is Cicero. The farmer has found this very practical, but the hogs have surpassed him in the utilization of the scheme. The bell leads the owner to his herd at any time, unless they are napping by the side of some shady brook.

The farmer often feeds his swine at intervals during the day with scraps of grain or fruit that accumulate in the kitchen. Before Cicero, the old reliable hog citizen, was belled, the entire herd wasted a great deal of precious time and energy racing to the house every time they heard the back door open.

After Cicero was belled, they left the job to him. In the meanwhile, they trained their ears to a keen understanding of every tinkle of the bell. In fact, they soon became experts in identifying every motion of Cicero's head from the tone produced by the clapper in the bell.

When the hogs are in hearing distance of the house and the back door is heard to open, Cicero takes to his hoofs, and his galloping soon puts him on the spot to meet and to greet the person who is supposed to dispense the food. If, perchance, he meets no one at the back door, he assumes that he or she must have passed out at the front door, so in a minute he has circumloped the premises. The other hogs ply their trades, although they maintain a keen ear for every sound of the bell. Should Cicero be successful, the champing of the food produces a peculiar sound of the bell which every hog in the herd quickly recognizes, and, although they may not be in sight of the house, they make a wild race to reach Cicero and usually arrive before he has consumed all the food!

Sometimes a naturalist witnesses the behavior of a certain animal or bird which requires a stretch of the imagination to interpret correctly. When, however, it is found possible for investigation, the curtain is lifted and the mystery disappears. One observation made in the year 1921 caused me much speculation until I was able to visit the spot where the bird's queer antics had been performed.

The Gnat-Catcher's Dance

IT WAS in the spring when the birds were merriest. Our road led through wooded land. I had been calling to a cheery chewink when a little gnat-catcher flew ahead of me and poised in the air near the ground under an oak tree. There it danced for a number of minutes. I had never before seen a bird behave in such a curious manner. After resting on a nearby limb for a few seconds, the little fellow flew down and resumed his dance in the air. When it had taken flight to a nest which it seemed to have under construction, I made a visit to the identical spot, and there to my great surprise found that the bird had been poised in the air facing the large web of an orb-weaver. The spider's web had many large holes torn in it where the gnat-catcher had removed the silken threads for use in building its own nest!

The closer we get to Nature's heart, the quicker we will be convinced that every animal beneath man is a mental, physical and spiritual fragment of a loftier creature, and that loftier creature is man. Therefore, man is the sum of all animal life beneath him. He is the Creator's masterpiece production in the animal world, complete with all the experiences and keen observations that the Creator acquired in the long-drawn-out process in making the lesser animals.

The Fight for Higher Postal Wages

By BURT M. M'CONNELL

IT WILL come as a distinct shock to most Americans to know that the biggest single business of the richest nation in the world—our own Post Office Department—is probably the most niggardly in the treatment of its employes. There are 351,000 of these, and their salaries range from $1,400 to $1,800 a year for post office clerks and carriers and from $1,600 to $2,150 for railway postal clerks. They must be men of intelligence and character, for their exacting employment demands honesty, alertness, and accuracy.

They are on duty every hour of the twenty-four. In fact, it is estimated that 70 per cent of the postal clerks' work is done at night, handling letters that are mailed at the close of the day. They must be honest and efficient. The letter carrier must make from three to five trips daily, regardless of weather, over a route varying in length from two to six miles. He must buy his own uniform.

The growth of such services as the parcel post, insured parcels, and C. O. D. packages have doubled his duties in the past ten years, yet in that time he has had but a single small increase in salary. In fact, there have been increases amounting to but $600 a year in the maximum salary of postal clerks in forty years, while the cost of living has doubled and even tripled in that time.

The maximum salary of a postal clerk is $1,800 a year, yet the Department of Labor's minimum budget for a family of man, wife, and three children is $2,043.73 in Washington, D. C. In many cities the figure probably would be still higher.

In the last ten years the postal employe has watched the purchasing power of his dollar shrink from one hundred cents to sixty-four cents; he has watched the wages of different classes of private employes increase from 70 per cent to 130 per cent, and the cost of living increase from 60 per cent to 100 per cent, while his own wages have increased but 30 per cent. Unable to make both ends meet, he has seen his children, as soon as they were physically able, forego educational opportunities to earn a few dollars to add to the meager family income.

Postal employes are not only poorly paid, but there is practically no opportunity for the advancement which ordinary private business automatically would provide as an incentive for faithful service. As family cares increase, therefore, the postal employe is obliged to engage in outside occupations. This, of course, unfits him for his government duties.

No one denies that our postal clerks and carriers are the most poorly paid of all government employes, service considered. The ordinary semi-skilled day laborer receives a higher wage. The present postal salaries, ranging from $1,400 to $1,800 a year, were fixed in 1920, when it was expected that the high cost of living would recede, but the cost of living is still about 72 per cent above that of 1914. From the standpoint of the postal employes, the problem is how to make both ends meet. The problem of the Post Office Department is how to get efficient clerks and carriers at the starvation wages now paid by the government.

The fact is that conditions in the service are such that it is not attracting the high class of men that it did ten years ago. The turnover in personnel is enormous—and it is said to cost from $50 to $200 to break in a new man. This is a tremendous drain on the government. Moreover, it lowers the efficiency and the morale of the men.

It would be infinitely better to appropriate from general revenue the additional money required to pay postal employes a larger salary and to put the postal service on a basis substantial enough to attract and retain a better class of workers. American citizens are entitled to first-class postal service, and such service cannot be maintained by disgruntled, underpaid, and constantly shifting government employes.

At present the Post Office Department faces a yearly deficit of approximately $24,000,000, but this is not alarming. It is not essential that the department be absolutely self-sustaining, as service, rather than profit, is the object sought. And an increase in postal employes' salaries need not necessarily be a drain upon the government; it could be financed by a slight increase in the parcel post rates. There is a growing belief that the parcel post service ought to pay its own way, and not forever continue to "sponge" on the first-class mail service and its equipment.

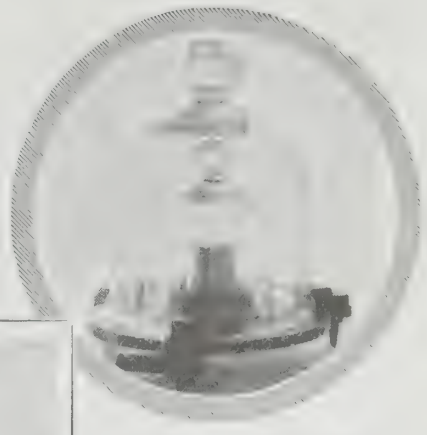
The Post Office Department estimates that the revenues from parcel post service are $150,000,000 a year. This means that 70 per cent of the mail handled brings in about 35 per cent of the revenue.

If the parcel post service were compelled to pay its legitimate share of the expense, it would furnish enough revenue to give every one of Uncle Sam's postal workers an increase of $400 a year. But whether the money comes from taxation or is derived from an increase in parcel post or other postal rates, the employes of the Post Office Department should receive a decent living wage. The service they render is indispensable to the public, and it should be maintained at a high degree of efficiency.

Do You Know What 'Full Measure' Is?

What is a pound? A yard? A gallon? A bushel? What is it fundamentally? No use saying a pound is sixteen ounces—What is an ounce? No use saying an ounce is 437½ grains—What is a grain?

By S. R. WINTERS



The kilogram weight at the Bureau of Standards is carefully guarded and protected. Note that it is covered by double-walled vessels.

Units of measurements, and their variations, in the metric system. Note the meter bar and the kilograms, which are standards.

THESE standards of weights and measures have become such commonplace things in our daily lives that we wonder if their true meaning and significance are fully appreciated.

These definite quantities of mass, length, and volume have become so fixed in our ordinary affairs that it is difficult to imagine our existence without them.

What did people do before standards of weights and measurements were introduced? They have had crude means of determining quantities since the earliest times. The Bible is replete with such references as "full measure" and "meting out." It was "about an ephah of barley" that Ruth daily gleaned out of the fields of Boaz—ephah is a Hebrew dry measure equal to a little more than a bushel.

At one period of history, an "inch" was the length of a finger joint; the "yard" was the length of outstretched arms, and a "foot" was expressed in the distance of the ordinary step. Even now, these crude methods of measurements may be employed where more accurate ways are not convenient or necessary.

But it is a long way from the ancient methods of weights and measures to the standards of precision of today. For instance, there is apparatus at the Bureau of Standards, in Washington, that will weigh accurately to the fineness of one part in 100,000,000. The weighing balance of this instrument is so sensitive that the body warmth from a human being will influence its action; and, therefore, it has to be controlled at a distance which body heat does not cross. This same scale will deguarded is illustrated by a true story of the circumstances surrounding its carriage to and from Paris, France, in 1920, where it was compared with the international standard of length. It was taken to Paris by Dr. Samuel W. Stratton, then director of the Bureau of Standards, and was brought back by L. V. Judson, chief of the Length Section of the Bureau. These are some of the precautions taken on the return journey: The bar was placed in a velvet-lined wooden case, which was wrapped in cotton batting and the case was inclosed in a tin container. The latter was packed securely and the entire outfit wrapped in several thicknesses of paper. The package was registered at the American Embassy in Paris and bore the embassy seals. Mr. Judson, in carrying the precious package in the taxicab to the train, held it in his lap, and on the steamer coming across the Atlantic Ocean gave it berth reservations. On the last lap of the journey, from New York to Washington, Mr. Judson slept in one berth of a Pullman car and the meter bar occupied the other. No human hand is permitted to touch this device, lest grease accumulate thereon.

The precision with which a thing may be weighed and the fact that the gallon of milk you buy in Maine is gauged by the same standard as that in California is a uniformity that has developed from the standards of weights and measures since the founding of the original thirteen colonies. These standards of measurements had their origin in England, and, as now, the principal units were the yard, the pound, the gallon, and the bushel. Then, however, there were variations, doubtless due to the lack of instruments of precision such as we have today. The following clause in the Articles of Confederation apparently recognized this lack of uniformity:

"The United States in Congress assembled shall also have the sole and exclusive right and power of regulating the alloy and value of coin struck by their own authority, or by that of the respective States—fixing the standard of weights and measures throughout the United States." This power was bestowed upon Congress by the Constitution of the United States in Article 1, Section 8, the wording being as follows: "The Congress shall have power: * * * *To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures."

Congress, quick to act in regard to coinage, seemed dilatory with respect to the subject of the pound, the yard, the gallon, and the bushel. Therefore, President George Washington in his first annual message to Congress, January, 1790, indicated the significance of the matter when he said, "Uniformity in the currency, weights and measures of the United States is an object of great importance, and will, I am persuaded, be duly attended to." Accordingly, the subject was referred to a select committee of the House of Representatives, with instructions to prepare a bill, and it was also ordered that the subject be referred to Thomas Jefferson, then Secretary of State. The latter submitted two plans for action. The first was to "define and render uniform and stable the existing system * * * to reduce the dry and liquid measures to corresponding capacities by establishing a single gallon of 270 cubic inches and a bushel of eight gallons, or 2,160 cubic inches." The second proposal was "to reduce every branch to the same decimal ratio already established for coin, and thus bring the calculations of the principal affairs of life within the arithmetic of every man who can multiply and divide plain numbers."

Action, however, was deferred by the House of Representatives until it was necessary for George Washington to broach the subject again, in his second message to Congress, on December 8, 1790. This time the House of Representatives ordered that the original report of Thomas Jefferson be communicated to the Senate. A committee from the latter branch of this lawmaking body reported its inability to authorize a change in the weights and measures at that time because the French and British governments had been consulted with regard to formulating an international standard. This report remained *status quo*, although Washington in his third annual message to Congress stated: "A uniformity in weights and measures of the country is among the important objects submitted to you by the Constitution and if it can be derived from a standard at once invariable and universal, must be no less honorable to the public councils than conducive to the public convenience."

A committee of the Senate, on April 4, 1792, recommended adoption of the decimal system proposed by Thomas Jefferson, but Congress still declined to take action. Consequently, the first act regarding weights and measures was not passed until the second session of the Fifth Congress in 1794, when it was ordered that each surveyor of the ports of the United States should examine and try the weights, measures and other instruments used in ascer-

termine, with utmost precision, the weight of a signature, distinguishing between the signature and the paper upon which it is written. That is, weigh a blank slip of paper, then write your name on it and weigh it again, and this instrument will give you the added weight of your writing. So great is the precision required in making measurements that in certain instances the telescope is displaced by an instrument known as the interferometer, which is accurate to *one-millionth of an inch.*

A meter bar or the national length standard in the possession of the Bureau of Standards is one of the interesting devices for maintaining standards of measurements, this bar having been designated for this capacity by President Benjamin Harrison in 1889. The jealous care with which this length standard is

Above—Hake gauge blocks, precise measurements which were extremely valuable during the World War. By means of interchangeable parts the same machine units could be used on automobiles or airplanes. Below—Precision weight. One part in one hundred million. This weighing balance is so sensitive that the operator controls it from an adjoining room, so that body warmth will not effect its action. It will weigh a signature.

China's Doctrine of Many Sons

So Fathers' Graves May Be Kept Green; Ancestor Worship—Secret of Population

By CARROLL K. MICHENER

WE HAD been aware of China's poverty and overpopulation ever since grade-school acquaintance with geography. But the why of it was another matter. Not until we were in the midst of China's pullulating hordes did the question trouble us. Then it became imperative. We asked our friend, Li Zuk Van, holder of the degree of bachelor of arts from St. John's University, Shanghai, and of master of arts from the University of Chicago. With Li we had just threaded the human rabbit-warrens of the native city of Shanghai. The mystic figure of four hundred million was in our minds vividly as we rubbed elbows with what seemed a large segment of that fabulous number. And we had emerged from the teeming narrow streets of the city upon a desolate field pocked and scarred with countless dun-colored grave mounds. Unnumbered dead millions, as well as the living, seemed to encumber the tired soil of old China.

"There are too many of you Chinese," we complained to Li. "Too many for your own good at least. How do you account for it?"

Li uttered an explosive group of Chinese monosyllables.

"Pu hsiao yu san, wu hau wei ta," he replied.

"I'll translate," he added, with a smile. "It's one of our oldest proverbs: 'Not filial is three; no descendants is greatest.'"

"I see," one of us rejoined. "Ancestor worship, you mean."

"You might," Li amended, "call it the doctrine of many sons."

He nodded toward the rabble of urchins at our heels, and over their heads addressed a woman of amorphous proportions and costume as she sat in the doorway of a mud and bamboo hovel.

"How many sons, great mother?"

Her reply was muttered in shy confusion.

"Ten forked tongues, she says," he reported to us, laughing. "She means ten daughters. No sons. That's a great disgrace. Her husband will give her one more chance. If the next child's not a son, he'll probably take a younger wife. He's got to have one son at least—and as many more as possible."

"Yes?"

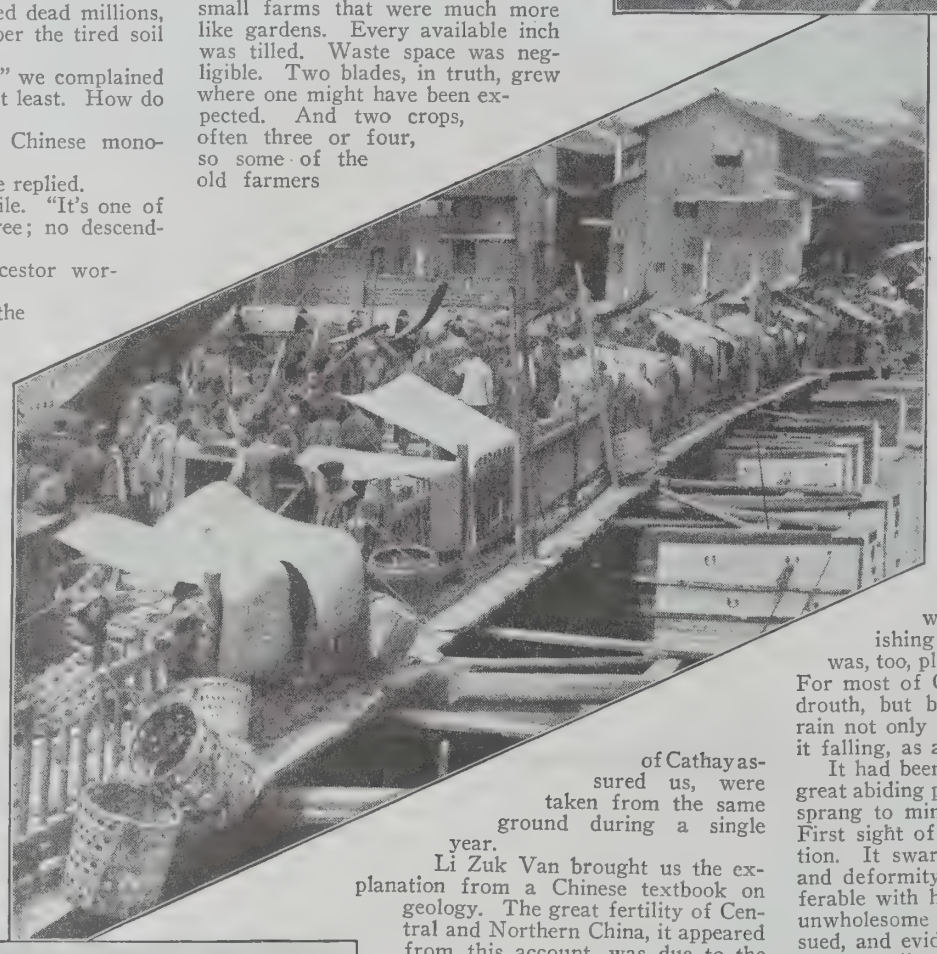
We had a vague idea of the reason, but wanted it clarified.

"To keep green his grave, as we Chinese put it. Ancestor worship."

This we amplified later from the collected lore of Bishop Bashford:

"The first and perhaps the chief human cause of the immense population of China grows out of a strange mixture of spiritual conviction and of the strongest passion of man. It is a religious conviction of the Chinese that no man can be at peace after death unless he leaves behind a son to perform the ancestral rites for the repose of his spirit. Future felicity is of such vital concern that every man old enough for marriage is determined to have a son before his death; and as death is no respecter even of youth, the earlier this young man marries, the safer his eternal interests. But the matter is of more than future and individual concern. All the dead members of the clan are supposed to be unfavorably affected by failure in the performance of ancestral rites; and the penalty for neglect of ancestral worship falls not only upon the individual but upon the family, and upon all members of the clan, usually coming in the form of drought, flood, or plague. Hence not the young man alone, but his father and mother, brothers and sisters, cousins and uncles, and aunts, are interested in his early marriage and the birth of a son. And for the same spiritual and yet intensely practical reason, namely, to placate the ancestral spirits and avoid calamity to the clan, the first and supreme duty of women in China is motherhood."

There were, of course, other causes for China's dense human encumbrance. These became evident to us as we explored the great fertile plain of the Yangtze Valley. This was a vast and fruitful empire, though it was but a segment of the country's cultivable soil. It lay like a continuous, unfenced field, but was made up, in fact, of a multitude of small farms that were much more like gardens. Every available inch was tilled. Waste space was negligible. Two blades, in truth, grew where one might have been expected. And two crops, often three or four, so some of the old farmers of Cathay assured us, were taken from the same ground during a single year.



Habitations of China's teeming millions—part of the great task imposed upon China's heroic soil.

At left—Market crowds on a pontoon bridge across the Grand Canal at Soochow.

(C) Underwood & Underwood

Li Zuk Van brought us the explanation from a Chinese textbook on geology. The great fertility of Central and Northern China, it appeared from this account, was due to the loess formation. The coastal plains, in other terms, were built up of dust blown away during the course of centuries from the shifting deserts and corroding mountains of Turkestan, Mongolia, and Siberia. Moist breezes from the Pacific caught it, brought it down and affixed it with vegetation. As a result there was an average depth of this fine deposited material estimated at thirty-five feet. Its fertility seemingly was inexhaustible. Its columnar structure enabled the rain to penetrate it easily and the roots of vegetation to push readily through it in search of nourishment.

But no soil, we knew, was capable of retaining its virgin qualities unassisted. Some other agency must have been at work here, for the soil of China had been under the plow, possibly, for three times the length of the Christian Era. A glance at the tremendous energy visible in the fields told the rest of the story. Necessity and industry put spurs to the land. Irrigation, fertilization, constant, laborious attention, brought it to the utmost pitch of production. It fed every possible mouth—and more.

Human energy and soil fertility, therefore, had had their important part, we concluded, in the upraising and nourishing of China's enormous population. There was, too, plenty of rainfall; too much of it, frequently. For most of China's many famines were caused, not by drouth, but by overflowing, uncontrolled rivers. The rain not only was plentiful but well distributed, most of it falling, as a rule, in the crop seasons.

It had been our impression, always, that China was a great abiding place of disease. Bubonic and other plagues sprang to mind at thought of the great purulent East. First sight of China did nothing to correct this conception. It swarmed with beggars and poverty, with filth and deformity. Shanghai in midsummer seemed insufferable with heat, fetid and miasmatic with all sorts of unwholesome bacilli. Yet more temperate seasons ensued, and evidence grew of the general salubrity of the Chinese climate. Disease, epidemic and casual, was carrying off its millions, as it had been doing through the centuries, but this was largely because of human ignorance and neglect. And we found the savants agreeing that China's climate was healthier than that of any similar area in the world!

The Chinese, at any rate, seemed to us the toughest and perhaps the most virile of any people under the sun. This was at once a reason for their vast numbers and a possible evidence of the favorable influence of climate.

Geographically, too, China appeared to us most fortunate. Including Manchuria, its latitudinal range paralleled not only that of the United States, but of Mexico and part of Central America as well. This wide dispersion gave the country a correspondingly wide variety of products, and its generally favorable location with reference to the Equator made possible the process of multiple cropping.

Second only to the firmness of our grade-school conviction that there were four hundred million souls in China was the belief that China was the most thickly settled country in the world. We had thought of the Chinese as overflowing the land, literally, and dwelling, for want of ground space, in cities of boats.

All this was true, but with reservations. There were spots in China, undoubtedly, that could claim more human beings a square mile than any other similar areas in the world. And the rivers and canals swarmed, in fact, with boat dwellers. But taking an average figure China fell far below the population records of half a dozen other crowded countries.

It was in this connection that we came nearest to heresy in the matter of the legendary four hundred million. Away from the teeming coast and river ports, with their densely inhabited surrounding lands, were great sparsely peopled places. Westward and northward were dry lands and deserts awaiting irrigation, mountain regions unexploited; in the southwest were Szechuen and other re-

Pavlowa the Peerless and Her Art

Is It Really Farewell This Time or Merely One of Those Patti Gestures?

By PETER SCHUYLER

THE present tour of Anna Pavlowa is announced as her "farewell" appearances. That does not necessarily mean that they are her last. "Farewell" tours were given an immortal black eye by the late Adelina Patti who probably made more "positively final" appearances than any other stage artist that ever lived. Taking her ultimate bow became such a fine art with Patti that it was just as important a part of her program as "Home Sweet Home."

Like the man who was such a notorious and confirmed liar that when he died no one would believe it, "farewell tours" are looked upon nowadays as a veiled threat to get the stay-at-homes to come out for the event announced. Shrewd judges of popular psychology as the managers of public entertainers are, they know what the reaction will be in the minds of those who read an advertisement telling of the "farewell" appearance of Madame So-and-So at the local palace of amusement.

"Of course, I know that all this goodby stuff is a fake," says John Jones to his wife, "and that Madame So-and-So will be back here next season doing another 'farewell.' But something might happen to her in the meantime and some day one of these swan songs will be on the level. You can't tell. Anyway, to be on the safe side, I'll stop at the theater and get a couple of seats for tonight on my way to the office."

That is the reason we have so many "farewell" engagements. Everybody wants to be in at the death.

But if Pavlowa's announcement that she is going to retire at the end of the current season and spend the remainder of her days "in her beautiful home in Golders Green, London," is a bona fide promise, something should be done to stop the catastrophe. She is too great an artist to be permitted to retire so long as the stage is cluttered up with so many counterfeit dancers. If only as a model to the steadily increasing swarm of maidens who are bent upon getting a living by dancing on their tiptoes she ought to be forbidden to retire to "Golders Green, London"—or any other place. Not only is Pavlowa needed as an exponent of beauty in motion and perfection in accomplishment, but she is wanted as a counter emmollient to the stage dancing of the hour.

Laying aside for a moment all other considerations of her work, the most striking quality of her appearance is her bodily reticence. Even in ballets where she is obliged to modify her costume for efficiency's sake there is never for an instant that suggestion of raw flesh which has come to be the hall mark of the specialty dancer. Lacking the spark of genius, the ladies of the prancing foot depend upon some other claim to notice. What they lack in talent they make up for by taking off a few more layers of covering, so that the more meager the ability the less the clothes. At the dear old Shubert Winter Garden, where a great pretense is made along the lines of ballet numbers, this fact is demonstrated irrefutably night after night. If Pavlowa ever gets into an ordinary show and shows the clientele what is the real art of Terpsichore, there will be a whole horde of dance fakers seeking jobs as scrubwomen. Therefore, as a moral force, as well as an artistic inspiration, it is to be honestly hoped that the announcement of Pavlowa's "farewell" tour is just one of those Patti gestures.

* * *

The essential beauty of Pavlowa's art is not that she is mechanically perfect in her technique, that she has a pair of steel feet incased in cobwebs, or that she uses her hands, her eyes, and her body with supreme intelligence and speaking quality—a few other dancers are like her in these particulars, although in greatly inferior degree; but they all dance with their bodies; Pavlowa dances with her soul. In doing that she is unique. She has color and dignity as well as being grace incarnate.

Even the dullest intellect cannot help being stirred to enthusiasm at the sight of her dancing. It is not remarkable that some things she does are more effective than others, making allowance for the varying capacities for appreciation which she encounters in her audiences, but it is remarkable that everything she does is received so completely and understandingly.

The ballet "Amarilla," in which she assumes the character of a poor gypsy girl in love with a careless young nobleman who treats her contemptuously, is not a bit more effective than her own choreographic poem "Autumn Leaves," which is pure symbolism. In connection with the latter number the program carries a stupid interpretation which shows that its writer can scarcely have seen the ballet, so unlike is it to the action. Why will these apostles of "Art" never let well enough alone! The thing that matters in "Autumn Leaves" is the indescribable gifts of the dancer, not some foolish story she is supposed to be trying to tell by dance motion.

In the exquisitely thought-out, spontaneously executed, and marvelously presented "Coquetterie de Columbine" Pavlowa is at her very best. No need here for a blundering interpreter to tell the watchers what the dancer means. Her art in this particular divertissement is actually vocal, and it was received with a storm of applause which, for duration and genuineness, this witness has scarcely ever seen equaled in a theater. The enthusiasm roared and surged, and roared and surged again, and each encore introduced a fresh bit of beauty.

As her male assistant, Pavlowa has in Laurent Novikoff a worthy successor to Mordkin. Novikoff is a great dance-actor, and he proves conclusively that one can look, act, and work like a real honest-to-goodness man even though he is a dancer. He has not the burly, strong-man physique of Mordkin, but he has true grace, a virile and winning personality, and makes a magnificent foil for the incomparable Anna.

Since Genee's day of greatness no one has approached Pavlowa.

* * *

It is more than thirty years ago since Arthur Wing Pinero opened the gates for the flood of "problem plays" by writing "The Second Mrs. Tanqueray." It is not to be inferred that his was the first drama which concerned itself with ladies of a hectic past. But it is certain that after all this time it is the best of the lot from any angle. The perennial "Camille" continues every now and then to make onslaught upon theatergoers with easily touched tear ducts, but there is a wide gulf between the Lady of the Camellias and Paula Tanqueray. The genus is the same, and ever will be, but the species is different. Scarlet is always scarlet when it becomes the favorite moral wearing apparel of women. It is only the cut of the attire which makes

Photo, Carlo Leonetti

MME. ANNA PAVLOWA in "Snow Flakes."

the nonessential difference. The peculiar fate of plays dealing with the weak sisters seems to be that they become the vehicles for popular actresses who are growing slightly passé and who unconsciously acknowledge that fact by their appearance in them. They seem destined to attract attention only when "revived," and a theatrical revival of an age-old success is more often than not an expression of conceit on the part of producer and player. The producer wishes to show the world that he is doing the play much better than the man who first put it on the stage. The player is anxious to prove that he, or she, can "play the part" much more expertly than the person who "created" the rôle. Comparisons are inevitable and usually disastrous—to the moderns.

Such certainly was the result of Arthur Hopkins' "revival" of Pinero's best play. The unfortunate feature of the presentation was that Pinero, who did not deserve it, got all the abuse. The critics united in the declaration that "The Second Mrs. Tanqueray" creaked intolerably, that it was "old-timey," and interesting only as a stage antique. As a matter of fact it was the acting which creaked, or, to be quite exact, groaned distressfully; and the unhappy audiences, when they were composed of those who had seen the piece at its best, groaned also. Not, however, for the same reason. "The Second Mrs. Tanqueray" is a fine play technically, morally, and histrionically. It must be to have stood up under the treatment it got. Nothing less than a real masterpiece could live a second under such handling.

Mrs. Patrick Campbell was the original "Paula." Her fame and fortune were established by her performance of the part. Prior to her appearance in "The Second Mrs. Tanqueray" with George Alexander, who played Tanqueray, and H. V. Esmond, who was Cayley Drummle (and who afterward wrote the delightful "When We Were Twenty-One"), Mrs. Campbell was practically unknown. She had appeared in a wild military melodrama, called "The Trumpet Call," as the lady assistant of the villain of the play. There was a scene wherein behaving like a true scoundrel—or a present-day divorce-court husband—the villain dragged his sister conspirator around the place like a sack of potatoes and with about as much consideration.

On the opening night, through some accident, the fastenings of Mrs. Campbell's dress failed in the struggle and she was transformed instantly from an abused assistant lady villain into an interesting anatomical exhibit. The resultant mouth-to-mouth advertising, which the episode received from those who had witnessed it, was not, as the catty-minded have suggested, the reason for the smashing success which the embarrassed assistant lady villain won a little later as Mrs. Tanqueray. Mrs. Campbell's "Paula" had everything which its revival lacked—fire, contrast, tenderness, the smear of her past, palsied anxiety for rehabilitation and acceptance by decent women as one of them; and heart-reaching piteousness in her tragic failure.

Underneath the Campbell characterization one always saw the conflict between the two creatures which were Paula Tanqueray; one, the mistress of many men, case-hardened, cold-blooded, viciously jealous, remembering involuntarily, like a reformed drunkard, the pleasures of bygone excesses; the other, the born gentlewoman craving with a passionate hunger a place in the heart of the innocent, convent-bred daughter of the man she had married, who automatically recognized in her what she had been and turned from her. There was none of this in the Hopkins revival.

If "Paula" was (to be quite gentle) altogether inadequate the work of the supporting players was worse. The men talked and acted as if they were not human beings at all but demonstrators of the fact that this was an "old-style" play. The least semblance of spontaneity or naturalness would have uncovered the indestructible vitality which the play possesses. But the gentlemen were apparently under the conviction that they were stage antiquities not living breathing men, and were determined to be just that. They were unpleasantly successful in carrying out their convictions. A more stilted, stiff, and stagey set of people it would be difficult to imagine. The Cayley Drummle of Lionel Pape, a light comedy part which offers scope for the powers of any actor, was as colorless as the work of the remainder of the cast. Yet the part was taken by a competent and experienced player. In all probability he was a victim of the delusion that the play was merely a parade of mechanical figures and not flesh and blood human beings.

There is an unwarranted belief among producers and directors that any play in which the characters indulge in an occasional soliloquy is perforce an antiquity. They imagine because "Hamlet" was written so many years ago and the Prince of Denmark soliloquizes, that any other play in which a character does the same thing is just as old as "Hamlet." They forget that the habit of talking to oneself did not cease with Shakespeare's day. People still do it, as any intelligent observer may prove to himself by taking a short walk in a crowded street. But Mr. Hopkins probably thought that because Aubrey Tanqueray once or twice in the course of the play's action speaks his thoughts out loud he was a kind of late-Victorian "Hamlet." That determination to be old-fashioned sticks out all over the presentation of "The Second Mrs. Tanqueray" as played at by Ethel Barrymore and her associates, and destroys both play and players.

* * *

No dread of ancient things hampered the Four Marx Brothers—count 'em—in their musical goulash, "I'll Say She Is," which has been running at the Casino Theater since early last spring. The older the jokes the better for the purpose of the Marxian quartet. Explicit and implicit reliance in gags at which the founders of the human race shrieked with delight among paleontological mists have impelled them to make them the warp and woof of the garment they have been selling so successfully at the Casino. The word garment is used advisedly since the show is geared to satisfy the intelligence and taste of the cloak-and-suit trade.

The Four Marx Brothers—Herbert, Leonard, Julius, and Arthur—served for long in the vaudeville wars and the sign of it is on them. They know that The Great Shine Way is just as countrified as the densest jungles of the variety circuits, and if they laugh in Belle Plaine, Missouri, they will laugh even harder at the rococo playhouse at the corner of Broadway and Thirty-ninth street.

Hence the method pursued by the four brethren. They fire their stuff at the onlookers without the slightest fear and as if they were pulling the trigger of a bell-mouthed fowling piece.

The dependable specialties with which the four youths earned their livelihood in the continuous houses are incorporated into the brightest section of the entertainment.

This is a travesty of "Napoleon's First Waterloo" and has to do with the Empress Josephine and her string of admirers. During the running time of the skit two of the Four Marx Brothers play the piano and the harp and generally disport themselves as true courtiers of the First Empire. The fun is roaringly funny but clean, and in commendation it must be said the performers do not go to the dirt heap for their material. There is nothing that is new in the piece except cleanliness. That, in the present state of the theater, is a genuine novelty, especially so in an evening which should be formally dedicated to the people whose life is just one basting thread after another.

Do You Know What 'Full Measure' Is?

Concluded from page 11

taining the duties on imports, and so forth. In the case of discrepancies and errors, the surveyor was instructed to make reports to the collector of the port. This act, in the absence of adopted legislative standards, was not put into operation until 35 years after its passage. Following the War of 1812, weights and measures again came to the fore in Congress. Such references as these are found: Compare the length measure with the length of the second's pendulum and also with that of an arc of the terrestrial meridian; to connect them by determining the weight of a certain bulk of distilled water, and to define the bushel and the gallon by the weight of the water which they contain. Congress again failed of action.

John Quincy Adams, in 1821, when he was Secretary of State, submitted an exhaustive report to the House of Representatives on this subject.

Meanwhile, most of the American states had adopted independent standards, most of which had been imported from England. Confusion existed abroad at this time. For instance, in England both the ale gallon of 282 cubic inches and wine gallon of 231 cubic inches were in use until 1824. After that date, the new imperial gallon, containing 10 pounds of water and of a capacity of about 277¼ cubic inches, was adopted.

Confusion in the buying and selling of commodities in the United States continued until May 19, 1828, when Congress acted specifically in the matter. The uncertainty with respect to coinage largely influenced action at this time. On the date just mentioned, the troy pound came into use, and from this emerged the avoirdupois pound universally used today. The troy pound, consisting of a brass weight, had been obtained in 1827 by Albert Gallatin, Minister of the United States at London, and it was delivered by special messenger to the director of the Mint at Philadelphia. This weight was a duplicate of the imperial troy pound of Great Britain. The casket and packages containing this troy weight were kept under seal until President John Adams visited Philadelphia and verified the authenticity of the seal. Formal ceremonies were conducted on October 12, 1827, when President Adams expressed belief that this brass weight was a duplicate of the pound weight of Great Britain. The Act of Congress of 1828, however, only made this pound the standard for coining money, but this in effect became the fundamental standard of weight for this country. From this was developed the avoirdupois pound, and whether you buy a pound of meat or a pound of dirt today you are governed by this standard of weight.

Two years after the troy pound was legalized for coining money, the Senate authorized a resolution directing the Secretary of the Treasury to make a comparison of the weights and measures then in use at principal customhouses. Discrepancies, to be sure, were found, some of the weights and measures being too small and others too large. The Secretary of the Treasury, then, in obedience to the Constitution requiring that duties, imposts, and excises shall be uniform, assumed the responsibility of standardizing weights and measures. First, certain units or definite representations of quantities were adopted, namely, the yard of 36 inches, the avoirdupois pound of 7,000 grains, the gallon of 231 cubic inches, and the bushel of 2,150.42 cubic inches.

The basis for the standard yard was the 36 inches comprised between the twenty-seventh and sixty-third inches of an 82-inch brass bar, which was made for the Coast Survey of the United States Treasury by a man in London. This bar had been brought to this country in 1813 by F. R. Hassler, superintendent of the Coast Survey. The 36-inch space on this bar was assumed to be identical with the English standard at 62 degrees Fahrenheit, although no direct comparison had been made. The avoirdupois pound adopted by the United States Treasury was derived from the troy pound in the Mint at Philadelphia, in accordance with the equivalent that one avoirdupois pound equals 7000/5760 pounds troy. This is in keeping with standards in England.

The units of capacity—liquid and dry measures—at that time, were the wine gallon of 231 cubic inches and the Winchester bushel of 2,150.42 cubic inches. The wine gallon was introduced in England, in 1707, during the reign of Queen Anne, but this measure was abandoned in 1824 in favor of the new imperial gallon, containing 10 pounds of water. This was also applicable to the bushel of 2,150.42 cubic inches. And, by the way, the bushel is the earliest capacity measurement of which there is a record, a copy of it being made in obedience to an order of Henry the Seventh. This, too, has been abolished in England in favor of the bushel of eight imperial gallons. Thus, strangely enough, the gallon and bushel in England and America still vary, those in this country being 17 per cent and 3 per cent smaller, respectively. R. W. Smith, in charge of weights and measures administration of the Bureau of Standards, tells this writer that these differences naturally create confusion in commercial transactions conducted by citizens of the United States on the Canadian border.

The establishment of fundamental standards of weights and measures had made such progress as to cause Congress to pass the following resolution on June 14, 1836: "Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Treasury be, and he hereby is, directed to cause a complete set of all weights and measures adopted as standards and now either made or in progress of manufacture for the use of the several customhouses, and for other purposes, to be delivered to the governor of each State in the Union, or such person as he may appoint, for the use of the States, respectively, to the end that a uniform standard of weights and measures may be established throughout the United States." And, although there is no law prohibiting such a procedure, the different states have not varied from these standards of the pound, the yard, the gallon, and the bushel. "Fortunately," indicates Mr. Smith of the Bureau of Standards, "there is more or less uniformity in weights and measures throughout the United States." Consequently, by 1850, most of the states had been supplied with sets of these standard weights and measures. A complete set of these representative units are inclosed in a glass case and located in the hall on the second floor of the administration building of the Bureau of Standards. These units include a brass half-bushel, a yard or meter bar, and capacity measures from a gallon to half a pint.

The most important legislation enacted by Congress, with reference to weights and measures, was the legalizing of the metric system in 1866. This, in effect, means that the Bureau of Standards has accepted the meter and kilogram as fundamental standards. The meter is a bar made of iron, with a cross-section of 9 by 29 millimeters. The original meter was constructed by the French committee of weights and measures; hence, it is frequently termed "Committee meter." The kilogram, called the Arago kilogram after a distinguished physicist, consists of a platinum cylinder with flat bases, the edges being slightly rounded. There is no mark or stamp on this weight, other than a faint mark of ⊙ near the center of the base.

Not only does the Federal Government maintain, through the Bureau of Standards, jealous supervision of the standards of weights and measures, but states, cities, and counties employ sealers of weights and measures. Both Federal and State governments are now largely concerned with the administration of laws governing the biblical principle, namely, "that full measure shall be meted out to you." That is to say, these governmental agencies are concerned with the problem of seeing that both buyers and sellers shall receive equitable dealings when trading in pounds, gallons, bushels, or yards. There are, however, numerous instances of fraudulent practices in the applications of the instruments of weights and measures.

Nature is a dependable source in searching for these standards; something that is unchangeable. And, having established these units of representatives of the pound, yard, bushel, and gallon, it is necessary that the government sees to it that these standards are scrupulously observed.

Finally, as you have doubtless noted, the standards of weights and measures are arbitrarily fixed by Congress. This same power could, if it so deemed, arbitrarily destroy these units of value. That is to say, Congress can enact legislation that would seriously affect the gallon of milk, the bushel of wheat, the yard of cloth, or the grains that make up the American dollar.

China's Doctrine of Many Sons

Concluded from page 12

mote inland empires capable of supporting vastly larger populations. A commercial statistician phrased the situation for us: "Six-sevenths of this enormous population of four hundred million Chinese is living on one-third of its area; the other two-thirds awaits the awakening voice of the locomotive to begin a development which will mean a new era in China"—and, of course, more millions of people!

The Taiping Rebellion, more than half a century ago, depopulated thousands of miles of land between Nanking and Hangchow, the approximate region of the civil warfare of 1924. Intelligent observers declared that the long-drawn and hideous carnival of slaughter that followed in the wake of a fanatic Christian pretender to the throne brought more than three million deaths. But not long after the "long-haired rebels" had been scattered by the "Ever Victorious Army," organized by the American General F. T. Ward, and at last led by the English Major C. G. Gordon, the hero of Khartum, the ranks closed up. City after city was repopulated, the land about them reclaimed, within the space of a generation. The recuperative powers of the Chinese people seemed unlimited.

Infanticide—the slaughter of unwelcome girl children—had gone on relentlessly for ages; was still going on under the republic. Only a man child was of use in "keeping green the graves." A girl was lost, completely submerged, in the family to which she went as a bride, or as a chattel. But this did not seem to have had noticeable effect upon the steady growth of population. It was an increase that was going on, and would continue to go on, probably, in spite of time and change and the new, insinuating influences of the Western World.

The changes that were most likely, we concluded, would be practical, physical ones—industrial and educational. They would affect, but make no great impression upon such spiritual forces as the doctrine of many sons. More than a century of foreign mission work had netted little progress against it.

Li Zuk Van, an Episcopalian, had long ago eschewed ancestor worship, of course, but he would not scoff at it. He preferred, indeed, to call it filial piety rather than worship of the departed. It was a philosophy, he said, an essential part of Confucianism. But in the end he agreed that, so far as the mass of the Chinese people were concerned, it was as near to their essential religion as it was possible to get. This religion, he was convinced, would change slowly.

We had heard China characterized as a vast graveyard. This came home to us at our first glimpse of a Chinese landscape. We saw no neat, walled, close-packed cemeteries, as in the Western World, with narrow lots and slender, compact slabs. Chinese tradition appeared to prescribe that the dead should lie in open fields, under mounds varying from three or four to twenty or thirty feet high. We saw them scattered over the cultivated fields, a vast army of the departed, impeding the efforts and stinting the meager rations of those who struggle to live. Every inch of tillable land was expected to grow its blade of vegetation, and even four or five; and yet, in the midst of all this admirable husbandry there was an appalling waste.

Mounds of the dead might be seen, not infrequently, in a fairly close family group, but usually they were scattered prodigally over cultivated fields, in such a manner as to occupy the maximum of tillable soil and to interfere as greatly as possible, seemingly, with agricultural work. From a distance these protuberances from the surface of a Chinese landscape suggested the sky line of a distant city, or from their number and shape a field of gigantic grain shocks. An occasional goat cropped the thin grass growing upon the ancestral hillocks, otherwise the consecrated land was of no practical account in feeding members of the family who had not yet reached the venerable estate of death. Trees sometimes inclosed the mounds, and not infrequently pretentious stone and mortar tombs relieved the funereal monotony of the open country.

The economic waste involved in this promiscuous encumbrance of graves could hardly be computed, yet it was easier, after seeing, to believe the old exaggerated saying that the dead in China required more room than the living. Some of the fields in the most populous regions of the central provinces were more than 50 per cent graves. The proportions dwindled, of course, in the less sparsely peopled interior. But at any rate the grave lands seemed to represent, to us, the fatal margin between adequate nourishment and practical starvation for hundreds of thousands of Chinese.

Historians reminded us that when Kublai Khan, the great Tartar conqueror, established his dynasty over the Chinese in the thirteenth century, one of his first acts was a decree commanding the leveling of graves. For a few generations China benefited from use of thousands of idle acres. Then old custom reasserted itself. The graves reappeared, multiplied, more numerous than ever before.

Modern ideas, we were assured, had done something to overcome this incubus, but plenty of wordy battles, both public and private, might still be heard over ancient graves, the identity of which was sometimes all but lost. Railroads, and the logical courses of many a public improvement, were not infrequently diverted to humor the tremendous sentiment that clung so stubbornly to these relics. There was, for example, the classic fate of the first railroad in China, between Shanghai and Woosung. The old empress dowager of Boxer days had it dug up and transported, to the last tie-spike, to the Island of Formosa, her reason being that it annoyed the good spirits of land and water and disturbed the venerable repose of Chinese multitudes long dead.

All this, as Li Zuk Van reluctantly reminded us, had its origin in the doctrine of many sons. It was a result of the system of filial piety, which worked two ways: it decreed the necessity for numerous progeny to "keep green the ancestral graves," and the more sons there were the more numerous became the graves to "keep green." The tomb had acquired the odor of sanctity, as a place for the expression of perpetual solicitude for the dead.

Li was authority for the assertion that this custom had resulted in the whimsical practice of choosing, occasionally, a temporary burial place. This was the explanation of many of the uncovered coffins cumbering the fields and crowding upon the very cart wheels of the highways. They were waiting for final translation to native soil; either that or for a mercenary and procrastinating Buddhist priest to determine by a process of necromancy just what spot was most propitious, and toward what point of the compass the deceased's feet should lie.

For choosing a burial place there could have been no logical process, judging from the heterogeneous location of mounds and coffins. With Li for translator, we consulted a scaley, mendicant, opium-sodden Buddhist temple attendant in Soochow. This was the wisdom gleaned from the priest's utterances:

Wind and water demons governed the digging of graves. A grave should not have a hollow near it. The wind would blow into it from that hollow and gradually disturb the bones and the coffin. In ten years they would be half-turned over. In twenty years or so they might be entirely turned over. Posterity of the dead, in that case, would certainly suffer from some material necessity or deprivation, probably a famine.

Great care must be exercised by the priest to conform to the intricate requirements of the deities pertaining to water. If water flowed past a certain point of the geomancer's fanciful compass, it caused prosperity, but if past another it caused poverty. If the branching point of water be at the northeast, to be more particular, it was possible that there might be prosperity for the deceased's progeny, but if east-northeast anything at all that was opprobrious and undesirable might then come to pass!

But whether we speculated thus over the graves, wandering among them and occasionally dangling our feet from the tiled abiding place of some defunct mandarin, or whether we chafed with the good-natured, mischievous hordes of children that were at our heels in every village, we could not escape the vital problem of the East. It dominated our minds like an evil dream. We could not cease to consider the possible future effect upon our own Western World of this growing monster of a race—a people in which the doctrine of many sons had subordinated every human instinct to that of replenishing the already grievously burdened earth, bending the whole life force of a virile race to expending itself in its stupid frenzy of reproduction.

How the Highlander Got His Kilt

Evolution of the Philabeg Can Be Traced From Eden Through the Ages

By VICTOR MITCHELL

PERSONALLY, I dislike the word "Kiltie" as applied to a Scotsman who dons the philabeg. The word is not Scottish and never will be, and was possibly the invention of some alien newspaperman who tried to be original. There is more truth as well as more poetry in the appellation of "Petites Jupes," chosen by the Ursuline nuns at Quebec when they first beheld the Fraser Highlanders who came with Wolfe. "Petite Jupe" means little skirt or petticoat, and petticoat means little coat, and little coat is exactly what the kilt is. It was very little to begin with, something less perhaps than the khaki aprons which the Highland troops first wore instead of their sporrans during the South African war; for, according to the Mosaic narrative, the forerunner of this garment was that which was fabricated when "they sewed together fig-leaves, and made themselves aprons." Skins of animals were not then available; these came later when Nimrod and other mighty hunters went into the fur business, and this form of apron or kilt, made in the simplest style of sartorial art, still survives in the garment made of the skins of beasts which is worn by sundry African tribes whose primitive habits have not yet been touched by the missionary and the rum-runner.

Like Unto Joseph's Coat

AT FIRST the kilt in the form of an apron of fig-leaves was merely tied round the middle by a tough fiber taken from one of the numerous plants with which Eden was plentifully supplied; but as woman's vanity grew, so did the garment, and in the course of time it was fitted with a waist, and was supported at the shoulders with straps, its length being prolonged almost to the knee. The waist belt was still retained, however, and the garment became in a way somewhat stylish, simplicity being the keynote. As the women did, so also the men. The kilt became for the time being a sort of little coat or tunic, supported at the shoulders with straps, and bound at the middle with a belt or girdle. This was the one and only garment worn by the Eden family and their antediluvian successors, and so it continued until after the deluge when the great dispersal took place on the plain of Shinar. There is no doubt that one of the languages spoken on that momentous occasion was the Gaelic, and that those who spoke it were afterward called Celts. Now, it is well understood by all students of the Celtic language that Celt should be pronounced Kelt, and it is, therefore, more than probable that to strangers the name of the people became confused with the garment they wore, and so we have the word kilt, although its Gaelic form is really philabeg.

In spite of the confusion of tongues which arose at Babel, and the diversity of language which ensued, the inhabitants of the earth still retained their love for the kilt, and in its various forms it was worn by almost every tribe and nation. It was the "petite jupe," the little skirt or coat, and the world was still quite young when the patriarch Jacob made a present of one of these useful garments to his favorite son Joseph. Jacob, it must be borne in mind, like many of his race at the present day, was apparently no mean exponent of the sartorial art; in other words, he was, like his ancestors of the fig-leaf period, a bit of a tailor and dressmaker, and so he made Joseph a coat of divers colors because he was his favorite son. The material for this work of art was undoubtedly spun by Rachel from the wool of her husband's numerous flocks, and was dyed by her or by some of her handmaidens in many colors; in fact, the material was tartan, and of this the patriarch with rare skill made a habiliment which at once aroused the envy and jealousy of Joseph's brethren, who afterward stripped him of it when they sold him to the Ismaelites and were likewise mean enough to dip it in the blood of a kid and make the old man believe that his favorite boy had been devoured by a wild beast. But, like men who have worn the tartan in much more modern times, and have emigrated or been transported to distant lands, Joseph showed wonderful shrewdness and adaptability, and prospered in the land of the Pharoahs; so much so indeed that when his brethren wandered that way in after years in search of provender, he aided them so powerfully that they were able to exclaim, "Wha's like us?" or words to that effect.

King Tut Also Wore It

NOW, as almost all the world knows, Egyptian civilization is the most ancient on the face of the earth; the farther back one goes the more civilized it is, and on the wall paintings, and hieroglyphics of the most ancient period, you will find the people wearing a form of the kilt. It was a very simple garment, and was dyed with many colors, and what is more likely than that it was introduced to the notice of Pharoah by Joseph, and that it at once became the fashionable garment of Egypt, and later the common attire of the people. Then along came the Medes and Persians and Assyrians, and other wise as well as warlike people from the East, and conquered the Egyptians, and they too adopted the kilt. That Assyrian who came down like a wolf on the fold was a kilted warrior, and when in their turn the Greeks came along, under the leadership of Alexander the Macedonian, and conquered the Persians and the Assyrians, they too arrayed themselves in this becoming raiment.

Anyone who has seen the Elgin marbles—in other words, the sculptured figures from the frieze of the ancient Parthenon at Athens—will have noticed that almost every man in the procession, whether mounted or on foot, wears the kilt if he wears anything at all; and exceedingly fine and graceful those Greeks of long ago look. It was a dress particularly useful for horseback riding—although the majority of moderns may not think so—allowing the nether limbs lots of freedom for the guidance of the horse. The wild Indians who used to scour the western plains were not unlike those mounted Greeks of a former age, and although the modern Highlander does not as a rule favor the kilt for horseback riding, there are instances where he has reverted to it when occasion demanded. When the great European war broke out, there came to the depot of the Gordon Highlanders a sturdy Jock, fresh from the plow and eager for a crack at the Germans. "What regiment would you like to join?" asked the recruiting officer.

"What regiment. Oh, havers. Gie's a horse an' a kilt, and let's awa t' the war."

There spoke the kilted horseman of a couple of thousand years before. To this day the Greeks wear the kilt, as all may see who visit Athens and admire those picturesque looking fellows.

Then in the march of conquest and civilization, Imperial Rome took up the standard—and the kilt. Before Caesar's legions landed in Britain, conquered Egypt, or swept the Near East, the kilt was a recognized article of wear among the men, as anyone knows who has seen the picture of a Roman soldier, or a Roman citizen of any kind for that matter. This garment was in many respects similar to that worn by the Scottish Highlander today, although the material was different. The heart of Caesar did not warm to the tartan, but this may have been because some of his legions had seen enough of it at the battle of Mons Grampius, or when his soldiers crossed into Gaul. But the "garb of old Gaul" was probably worn by the ancient Caledonians long before the Roman legions ever tried to fly their eagles over the Grampian Mountains. The clan system, however, was of later growth, as were the distinctive tartans by which the clans were identified. They say that Margaret, that sweet queen of Malcolm of the big head, took a great interest in the weaving and dyeing of the fabrics which in her time came to be called tartans, but which some at the present day call plaids; but a plaid is in reality not a material but a garment. Like Rachel of a much more remote generation, Queen Margaret both spun and dyed the wool which went to the weaving of these fabrics. The Scots got her canonized as a saint, and she may be called the saint of the cult of the tartan.

The Cult of the Clan Tartan

THEN came the period when the Scottish clans began to wear colored tartans of distinctive designs. The colors and checks in the material began to be as distinctive as the totems of the Indians. It is now by this means as easy to pick out what clan or regiment a Highlander belongs to as it is to tell whether a horse is a Clydesdale or an Indian mustang; the pattern of the tartan of his kilt is all that is necessary. For example, the Gordon tartan with its yellow stripe on a dark ground of green, blue, and black, is unmistakable, and the same dark tartan without the yellow stripe is that of the Black Watch, a still older organization. Then there are the Seaforths who wear the tartan of the clan Mackenzie, which, instead of the yellow stripe, has a red one and a white one; and then there is the Cameron, with its brighter display of red and yellow, which is perhaps the showiest tartan of them all. There are scores of clan tartans of divers other hues, just like Joseph's coat of many colors, and these are all quite as distinctive. Perhaps one of the best known is that which is called the Rob Roy, which was worn by the proscribed members of the clan Gregor. It is a red and black check of simple design, and is noticeable because it bears no resemblance to any of the others.

But it is a mistake to suppose that all Highlanders who live in the Highlands wear the kilt, Sunday and Saturday, all the year round. This used to be the fixed belief of Englishmen and foreigners, and it is not yet dead. A few years ago an opulent Chinaman astonished the natives of the good town of Nairn by appearing in their midst in the full panoply of the kilt and sporran. His ambition was to learn to play golf, and he had heard that the kilt was the correct costume to wear on the links. So, too, with those wealthy members of the Jewish race who wander among the mountains in the grouse-shooting season, determined to back up their assumption (for business purposes) of good old Scottish clan names by the adoption of the kilt, and at the same time maintain the tradition of Joseph's coat of multifarious tints. But of all people that on earth do dwell, in which the notion that all Scotsmen wear the kilt is firmly implanted, there are none who stick to the idea more tenaciously than the cockney tourists who come to climb hills and ramble over the heathery moors in search of deer—or rabbits. Their idea is that if the kilt is an essential part of the national dress they are bound to wear it to secure the good will and approbation of the unsophisticated natives. But they invariably put it on the wrong way, and their pale and trembling knees proclaim that the penance is severe.

The kilt is, however, very comfortable when one is accustomed to it, and allows a freedom to the limbs which is impossible in the modern form of that bifurcated garment called trousers. For those who imagine that the kilt possesses the element of femininity it may be pointed out that, although at first it was worn by both sexes, it became essentially a man's dress at a very early period. The fashion of wearing trousers came from the East, and it was not the men who first wore this garment, but the women. The women of the East wear trousers to this day; and now some of their sisters of the Occident are following their example.

Should Be Properly Worn

LIKE other articles of attire, no matter of what design, there is a right and a wrong way of wearing the kilt. It should neither be too long nor too short, and great nicety is required in its proper adjustment. The hem should come just as far as the middle of the kneecap and no farther, and it ought to be of the same length all round. When donning a kilt a test of its correct length may be found by kneeling, and if when in this position the hem of the kilt touches the ground all round it is properly put on. An improperly worn kilt is like a badly played tune—its expression and harmony are gone. As an orderly officer in one of the Highland regiments, it has been my duty to stand by while the guard was being mounted and see that every man composing the guard wore his kilt in the correct manner. In this philosophy of clothes, as Carlyle calls it, there is more than the uninitiated might think. A man may put on a pair of trousers and have them just right at the first trial, the crease coming down the center and all complete; but it is quite a different thing with the kilt. If the kilt is not put on neatly and is not hanging in the recognized manner, "That man is not properly dressed," thunders the adjutant. Civilians who wear the kilt often have an undervest or body attached to it which is suspended at the shoulders, just as it was done long ago, but in the Highland regiments it is bound at the waist leaving the shoulders free. A narrow belt is then passed round the middle from which depends the sporran or purse. The sporran is usually made of goat or horse hair, or the skin of some fur-bearing animal; it is the lineal descendant of the apron which was worn in the garden of Paradise.

No advocate of the kilt claims that it is suitable for all sorts of climates, but it is good enough for the most of them. "Do you not have to wear something warm to supplement the kilt?" asks the curious. The answer is in the negative. It has been worn by men in all climates and almost under Arctic conditions, just as it was in the Crimea and in Canada. It has been found equally useful under the burning sun of India or of Egypt. During the winter following the siege and capture of Quebec a number of the Frasers were quartered in the Ursuline convent, and, says the historian, "the unsophisticated nuns were so distressed at the bare legs of the Highlanders that they begged General Murray to be allowed to provide the poor fellows with raiment"; but the "poor fellows" only smiled. There is also a story told of one of the Macphersons of Badenoch who found his son asleep in the snow, during the arduous expedition, with a small heap of the frozen element for a pillow. "Let me see none of that luxurious spirit," said the chief as he spurned the frozen pillow from beneath the head of his degenerate offspring.

Once It Was Forbidden

AMONG the Highland Scottish the kilt is, of course, not nearly so much in evidence as it was under the old clan system, just as the national costumes of other nations of the earth are being lost sight of in the march of modern conditions; but this does not mean that they have discarded it or have less affection for it; and it is still the dress of the Highland soldier, be he Black Watch, Cameron, or Gordon. After the disastrous ending of the '45 on Drumossie Moor, the wearing of the kilt was forbidden by the government, but King George III was obliged to rescind this order, and wherever the expatriated Scot is to be found, there will you also find the philabeg.

Nevertheless, there have been Sassenach secretaries of state in recent years who have ventured to suggest, on the plea of economy, that the kilt should be abolished in the Highland regiments, because a kilt takes far more material to make than a pair of trews; but signs of mutiny and revolt in the ranks of the descendants of the men who have worn it for eons have been sufficient to bring officialdom to another way of thinking. And so the wearing of the kilt will continue until the end of all things, just as it originated at the beginning thereof

THE LIBRARY OF THE

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in this paper last week an interesting series of Lincoln stories. Dr. Barton's excerpts from the Browning Diary throw light on the serene and final quality of Lincoln's political wisdom in turning personal enmity to the service of his cause. This recalls that Dr. Barton has a two-volume work on the press which will contain much new Lincoln material, the fruit of a lifetime of research. The Step-Mother of Lincoln—in how lowly a guise the great call came to Sally Bush, and how nobly she fulfilled it! That is an article worth pondering. The article on Lincoln's City of Springfield is marked by the inclusion of an hitherto unpublished letter of Mrs. Lincoln. In "Lincoln Encircles the Globe" is a vivid picture of the impression which Lincoln's spirit has made on the nations, East and West. Two articles of personal reminiscence of an unusually interesting character are found in the interviews with William O. Stoddard, the aged and still-surviving one-time secretary to the great President, and the recollections of Betty Smith who met Lincoln in the old Palmer House at Chicago and preserves for us a characteristic Lincoln saying, "You can't fly a high kite unless you have a long string." Then there is a contribution to that much debated question, Was the assassin of Lincoln really killed or did he escape and die thirty years after? Taken altogether, this Lincoln issue of THE DEARBORN INDEPENDENT is worthy of preservation for the intrinsic value of its contents.

I read in the papers and magazines many articles about that apparently strange race, the Americans. In foreign reviews we simply would not recognize ourselves. And when our American scholars attempt to interpret us to the intellectuals of Europe, the result is just as bad. The attempt at internationalism, in this respect at least, is not a success. It is a little late, anyway, isn't it? Nations are not the whole thing, as they seemed to be twenty-five years ago. European nations were so often mere political divisions of the same race, that when Austria threatened Serbia, Russia's reaction in Serbia's defense was not national so much as it was racial; and a war beginning that way has had the effect of bringing racial facts to the fore. Nationalism is now justified only as it affords conditions for racial development. The old optimism that if we only knew other peoples, we should love them, has not been proved by experience. Our doughboys disliked their French allies and liked their Saxon-German enemies. It was race speaking. Here in America we have provided conditions favorable to certain race developments; that was the purpose in America's planting, and is the justification of America's will to live. Until our savants begin to include this element in their interpretations, their efforts will but add to the world's present confusion.

I read in the papers that Lord Cecil—we gave him the Woodrow Wilson Peace Prize of $25,000 the other day—is valiantly fighting for the continuance of the opium traffic. He is not a pacifist on that point. He fights. And in a very bad cause. Moreover, he indulges in slander when he is off United States soil. He accused the Americans of being the foremost opium users in the world. After our United States Representative Stephen G. Porter got through with his lordship, there was nothing left but a craven apology and immovable determination not to agree to any practical steps toward suppression of the opium traffic. What I find it hard to understand is this: that Americans are so badly misinformed as to the foreigners they honor. Of course, professional pacifism in this country is one with professional pacifism abroad, and it is perhaps as inaccurate to describe the one as American as it is to describe the other as British, or whatever it may be. Anyway, there should be a line against handing out Woodrow Wilson prize money to men who have it in them to slander the plain people of America.

I read in the papers that the bricklayer is still quite a man overseas, or would be were it not for the absurdities of trade unionism. In England, for example, with housing a bitter problem, and 36 per cent of every dwelling being a bricklaying job, the number of bricks laid per day grows smaller. In 1914, with a 10-hour day, 900 bricks were laid per man per day, or 90 per hour. In 1920, with an 8-hour day, the number of bricks fell to 200! This is 25 an hour! Of course, as the output falls, the cost increases, and as the cost increases, building ceases—and the policy of making more work by doing less results in no work at all. Yet these are the people who want to tell America how to run world affairs.

I read in the papers that King Alfonso is getting tired of keeping a kingly silence under attack. The Ibanez attacks appear to mean little in Spain. What is true in them has long been known and what is untrue has long been charged. Alfonso says, "Nobody asked me whether I wanted to be King. I was placed upon the throne and here I must remain, to do good." He expressed the hope that his detractors, meaning Ibanez, "instead of writing pamphlets, would write some interesting romances which we all can read and admire."

MR. FORD'S Page discusses the moral responsibility which Progress brings, with special care to rid the term "moral" of its unnatural associations. The moral in the sense of the practical commands attention.

"TOO proud to fight." "Peace without victory." Every statesman's diary published since the war testifies how great was the jar when President Wilson let loose those unparalleled ideas on the world. Huston Thompson asked Woodrow Wilson, before he died, what, precisely, he meant by "peace without victory." Mr. Wilson wrote the reply, which is now in Mr. Thompson's possession. It is quoted here this week. Woodrow Wilson as an orator has never been more ably and intimately presented than here. (Pp. 4 and 5.)

GEORGE WASHINGTON may never have told a lie, but he was not averse to "stringing" the over-credulous. A downright lie in one connection is "Yankee humor" in another. We don't think of the dignified Father of His Country as a Yankee, but he had all the traits; humor being one. Another sidelight on the First American—page 11.

HAVE you worried about the younger generation? If not, you are a lucky exception. So many people have worried that it is a national question now. One opinion is just as good as another; some say that we are headed for the devil; others say that the scions of our stock have as much sense as we had and will round to all right. But what Luther Burbank says has special value. He has been thinking about the Young Generation, and studying it. He says, "I have learned to suspect facts that look too dark." That's good—the worst is never true. You will like this article of pure common sense—page 2.

"Dollar Diplomacy" says some important things in an authoritative way. The substitution of Dollars for Bullets—page 6.

THE so-called "liberal" magazines are breaking out in a race rash. Members of the one race that insists on racial exclusiveness are busy writing (for the instruction of other races) that there is no such thing as race. (Anthropologists heard softly laughing in the background!) Well, there is a fact of race, a big fact. It is not recognition of the fact, but wrong interpretation of it that causes all the trouble. The "Nordic" race is just now much to the fore—the northern white race. What Dean Inge, of London, thinks of it may be worth your while—page 14.

What about all the French dukes and counts? Where do they stand in a Republic such as France is?—page 12.

THERE is no mystery about the prohibition failure. Enforcement officers are largely personal foes of the law. In one enforcement office which was studied the ratio was 16 against the law to one in favor of it. This is a matter of facts and figures. See page 10.

Another delightful George Washington item is the sketch of his "home town"—page 3.

American libraries (p. 9), Benjamin Franklin (p. 12), the Moffat tunnel (p. 13) are interesting American notes.

When Youngsters Emerge From Their Fake Life Will They Be Able to Face Real Life? Burbank Thinks Probably They Will

By LUTHER BURBANK

WHEN I was a boy and for forty years afterward, children were not generally appreciated, in some cases were regarded as nuisances and it was quite generally held that children owed everything to their parents. Out in the country, boys as young as 12 years were frequently "bound out" to a neighboring farmer until they were 21 years old. It was practically slavery. The boys worked hard, went to school in the winter, for a year or two, and received nothing but their board, washing and a few poor articles of clothing. Usually a small sum of money was paid in addition which went to the father.

I think that a book I wrote 25 years ago, entitled "The Training of the Human Plant," had something to do with changing the attitude of parents toward children. I tried to show the importance of children and the racial advisability of giving them every possible chance to develop whatever good might be in them. At any rate, the attitude of parents toward their children has undergone a great change and the change is in the direction that I urged.

But something else has changed. The attitude of children toward their parents is no longer what it used to be. Children, always quick to accept the views of their parents whether they act upon them or not, have emphatically accepted the view that children are not a nuisance, that instead they are the most important things in the world, and that they don't owe everything to their parents. The young people of today fully know their worth, and, while they honor their parents, they feel that their lives are their own, that they owe their parents little or nothing, and that their parents owe them a great deal—maintenance in their youth, at any rate, and the best opportunity the parents can provide to give the youngsters an education.

The Young Can't Think, Only Feel

THE young people of today are so different from the generations that preceded them that we may well search our minds in an effort to discover the causes and foresee the results.

I can see a number of things that appear to me to be causes, first of which is the changed attitude of parents toward their children and children toward their parents. This is a part of environment and it is to environment that we should look because the young people of the present day are fundamentally what their ancestors were.

But what a different world it is in which they live. The world is changing so very rapidly that it is difficult for all of us to adapt ourselves to the changes, but it is probably more difficult for the young than for the old. The old can think a little and perhaps solve some of their difficulties. The young can't. They can only feel.

How do they feel? Chiefly, they feel restless. The young people of today prefer to be almost any other place than in their own homes. The boys have address books filled with names, take their fathers' cars and call nightly on young women for 20 miles around. Boys from 18 to 22 do this. They may not and probably do not care particularly for any one girl. The prettiest girls and the best dressers are the favorites chiefly, it would seem, because they are the most desirable to take to dances. The young fellow who has the belle of the ball immediately becomes a personage of great mesmeric powers in the eyes of all the other young fellows. This feeds his vanity and he races around to find more well-dressed beauties to take to more dances. There is no end to it until the boy's father makes an end to it—for a night or two. Then the father is told, respectfully but firmly, that he is all right, well-meaning and wise about things in his own field, but hopelessly out of date as to the affairs of the young. The boy cuts out dances for a night or two and then takes the car and goes to burning up gasoline again.

Boys and girls a little younger are hypnotized by the movies. Why? Because they are eager for thrills. The picture that has the most thrills draws the most young people. The more persons there are shot, cut in two in sawmills, dropped out of airplanes, run over by railway trains or forced to jump from the upper stories of burning buildings the better the youngsters like it. All too frequently they see pictures that present problems, situations and occasions that the young might better not see, and as they sit in silence one may wonder how much of it they understand and what they are thinking about.

Thrills Burn Out the Nerves

MOTION pictures might have done a great deal of good for the young, but as far as I am aware they have not yet done them any good. That is because a crowd of unprincipled persons have gained control of the movies and use them solely to get money.

A thrill of one sort or another being about the easiest thing to get across to a young person's brain, plenty of thrills have been put in. And they are bad for children—bad for everybody.

Each thrill, as it travels along our delicate nerves, is like an overload of current on an electric wire. Load a wire too heavily and it melts, perhaps setting fire to the house. Load nerves too heavily with thrills and they burn out.

We were never intended to live on thrills—and we can't do it. We can only die on them if we keep them up long enough. A good many of the young people of today are preparing early graves for themselves.

Now what are these and many other similar activities doing to the young people? They are doing just what a poor cook does to the food he serves when he spices it too highly. Good food tastes flat after one has fed too long on condiments. Home life seems flat after young people have had too many dances, too many movies, too much excitement, too many thrills.

Real life does not flow along like the movies. Real life rises to great heights only upon rare occasions. Usually it is like a broad stream flowing to the sea.

The artificial life that has been made for the young has a Niagara every block, with perhaps two boiler explosions and a murder in between—at the movies.

No wonder real life seems dull.

"Real Life" Has Its Dull Moments

NO WONDER young people are restless and do not care to stay at home.

Yet in a little while, all of these young people will have to face real life and deal with it. The young women will go to housekeeping and the young men will go to work to prepare a home, probably not so good at first as the parental home that they considered so dull.

But it will be "dull" because it will be real; no movies, no dances, no thrills, just life as human beings are ultimately required to live it.

How well are the young people of today likely to be able to adapt themselves to what must soon inevitably be their new surroundings? It all depends upon how expert they are in turning a square corner at high speed. They will not be able to turn it easily unless they suddenly develop resources within themselves that are sufficient for their own entertainment. One of the glaring defects of the youth of today is its utter reliance upon the outside world for the joys and satisfactions of life.

Young people can no longer entertain themselves. They must be entertained by others.

That is why they do not want to spend their evenings at home.

They want the movies or their friends to entertain them.

As far as enjoyment is concerned there are no longer any "self-starters."

No young person can be contented or happy unless the impulse to be so comes from outside himself.

Forty years ago each country boy was a host in himself. He needed nobody to entertain him. He could think of plenty to do because he had to think or do nothing. Thinking is more or less painful. All the country boys that ever lived would have preferred to obtain their pleasures without thinking if they could have been obtained that way.

But it requires no thinking to watch a movie. The movie thinks for those who see it.

The young people of today are losing much that is of the highest value by depending upon others for their happiness and failing to use their own resources. *They are cultivating dependence instead of independence.* Great men and women are not made by such training.

"What to Be When I Grow Up"

LOOK at our young men. They reach 20, and some of them more, without knowing what they want to do in the world. In this age there are more kinds of interesting occupations than ever before, but it is a rare thing to find a young man who has been strongly attracted by any of them. He may have a vague idea that he would like to do this or that, but he does not know. He flounders about because he cannot find himself.

Why can't he find himself? Why has none of the unprecedented number of interesting occupations attracted him? First, because he has been living in such a whirl of artificial excitement that he has *seen* nothing. The real world has not attracted him because the lure of the artificial world has been so strong Second, because the real world looks flat and uninteresting after one has lived so much in the *fake world* of thrills. Bread tastes flat after cake. Third, because he has neither taken the time to *think* nor develop the *capacity* to think.

In my day it was not so. Thirty years ago it was not so. Smart boys, almost from infancy up, thought they knew what they wanted to do. They changed their minds as they grew, but they always had something in mind. Why? Because their minds were fresh and quick to receive impressions. Fake worlds had not made the real world seem dull. Every new thing as it came along was interesting. The 5-year-old boy who saw a railway train soon became seized with the determination to be a locomotive engineer. A little later something else flashed across his vision and he forgot the locomotive to turn to a different occupation. By the time such boys became 18 they generally knew exactly what they wanted to do in life and perhaps were started on the way toward doing it.

One thing is certain—*the young men who do not prepare for life will have to take life unprepared.*

A good many of the young men of today who look forward to pleasant lives are going to find the years after 30 pretty dusty unless they look out.

But perhaps they will "come to" in a rush in the twenties and find themselves. I don't know. Nobody knows. The world of young people, as we see it today, is an entirely new world to all of us. Nobody ever before saw anything like it.

Partly because of reason, partly because of a faith that goes beyond my understanding, I believe the young people of today will in some way solve the problems that will soon confront them and come out all right. The facts in their case look somewhat dark, but *after a long life I have learned to suspect facts that look too dark.* A good many times something is the matter with such facts. They may be true as far as they go, but they may not be complete. Perhaps we do not sufficiently understand the latent powers of the young who are so beset by the clamor and whirl of the present age. Great allowance must always be made for the common sense of human nature. Without some common sense *we* should never have been able to go as far as we have gone.

Certainly no other generation within my knowledge ever had so much need for common sense as the young people will have who are, so soon, to take over the world's affairs and carry with them, for a time, human destiny. They will need an unusual amount of common sense because, according to all past standards, they know very little about real life. They can't know much about it because they have spent their youth in a world of thrills and artificiality.

Small Town Life a Great Incubator

WHEN we talk about what any untried generation can do we are venturing upon ground the topography of which is almost unknown to us. We have always believed that the farm was the place to raise brains and that the city was a bad place in which to bring out whatever qualities of greatness children may have in them. We have proceeded upon this assumption because so many of the great men whom we could recall came from the country. We had no facts whatever; nothing but our random recollections.

In the current edition of "Who's Who in America" may be found some facts bearing upon this question. The editors of this work sent a questionnaire to the men and women whose names appear in this volume asking them to tell, for statistical purposes only, whether their fathers were professional men, skilled or unskilled workers, whether the subjects themselves were reared on a farm, in villages, cities or the suburbs of cities, what their educational advantages had been, and so on. Inasmuch as nobody was asked to sign his answers, the editors felt that they could get, with this questionnaire, not only the truth but the whole truth.

The answers utterly destroy the great-man-from-the-farm theory. The farm is revealed to be the worst place in the country in which to produce men and women capable of achieving enough to get their names into "Who's Who." Small villages are better, cities better yet and the suburbs of cities best of all.

Of course, it is not to be assumed that what a man or woman is capable of achieving is solely dependent upon where he or she was reared. More depends upon who and what their parents were. Heredity comes first, environment second. But environment is a powerful factor and, as far as we know, the environment of the farm is not, as a rule, stimulating.

The exceptional mind only soars in silence. Most of us have need of a powerful environment to which to react.

The Darkest Facts Are Never True

THOSE who are to come after us may therefore see what we do not now perceive—that the world of the young, as it is now whirling before us, did not *destroy* but only *retarded.* It may even be disclosed that what has seemed and still seems to us to be a cessation in the development of the young was but a period in which a greater head of steam was gathering—a period in which, unconsciously, they were mustering their latent forces for a drive against the world!

It is all guesswork. The facts are against the young but I don't believe the facts. Nobody knows what is going to happen to them, but I cannot believe that it is going to be anything bad. I believe they will develop the ability to meet life as it will soon present itself to them. Not all of them will win in the struggle. All do not win in any struggle. Some will fail. The most adaptable, the most intelligent, and the most energetic will pull through.

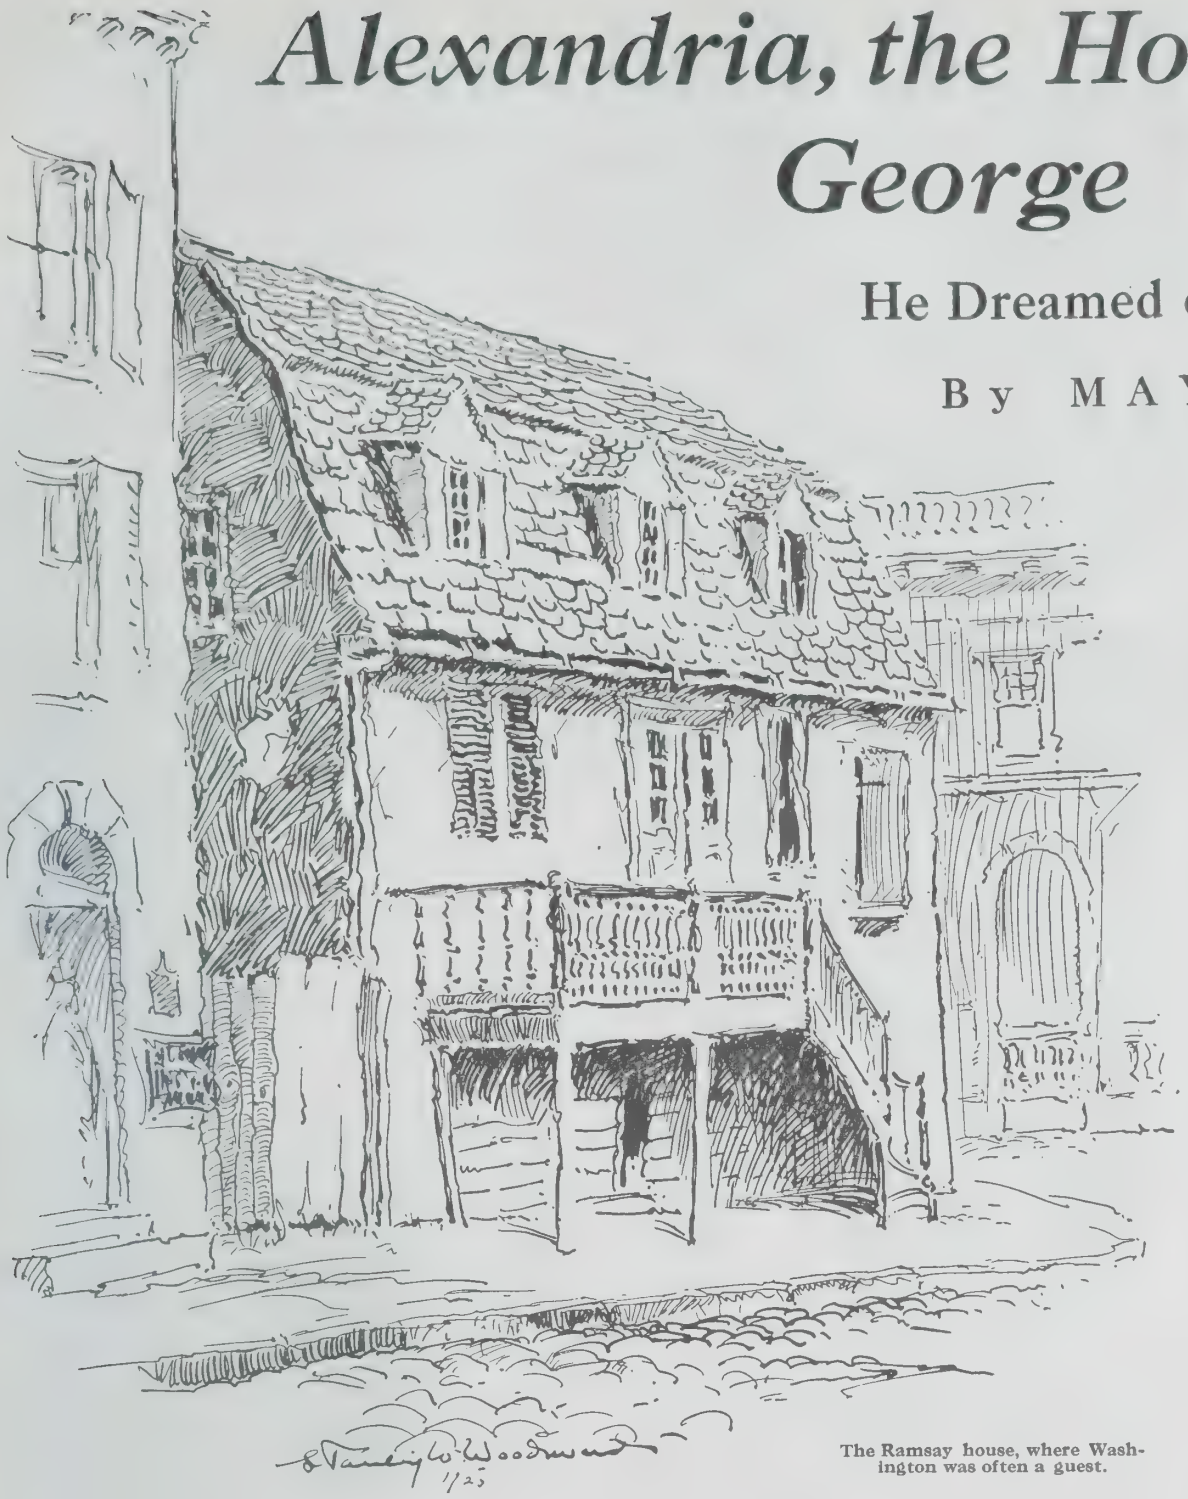
In some ways, this young generation is perhaps the best that ever lived. For one thing, it has better health because scientists of one kind and another are teaching people how to live.

I cannot say that I am an optimist about the rising generation—I can see too many unprecedented difficulties, obstacles and handicaps confronting it and surrounding it to be an optimist—but I am hopeful and confident. I believe that, as the English say, some way or another it will "muddle through."

Alexandria, the Home Town of George Washington

He Dreamed of It as Nation's Capital

By MAY B. WHITING



The Ramsay house, where Washington was often a guest.

WASHINGTON loved Alexandria all his life. As a boy he rode through its lanes and helped survey its streets and in manhood he dreamed that it might become the nation's capital. It is well for us that such a vision was not realized, for if it had been the landmarks that knew the hero as a man, not a half-mythical figure, would have been swallowed up by public buildings which, although handsome, have no soul.

Happily grandeur passed it by, and it remains one of those border cities where the trimness of the North melts into the geniality of the South. Aristocratic colonial houses are elbowed by uncouth dwellings, each amiably tolerant of the other, and, rattling beside the modern sight-seeing bus, are strange equipages drawn by rawboned horses. Friendliness and courtesy are the rule. Nowhere was the struggle for freedom keener, and today the chief ornament of the public square is a monument to the Confederate soldier.

As the conflicting tides of history swept by, they left their traces in the names of the streets. At first the town was the metropolis of British rule, winning the title "Old Dominion," and the names Royal, King, Queen, Prince, Duke, Cameron, and Fairfax, attest its loyalty. Rolling Road was the highway to Williamsburg along which hogsheads of tobacco were rolled to market by passing a bar through them and hitching oxen to it. But George III would not sanction any measure of advantage to the town. The marshlands outside the city are called King George's meadows because His Majesty refused to drain them, and the new generation named its highways for Washington, Jefferson, Madison, and Franklin. Patrick Henry had two streets named for him.

In this town Washington, the youth, made his friends. As a lad he was smitten by the charms of a "Lowland Beauty," Miss Betsy Fauntleroy, and he writes of his "poor, restless heart, wounded by Cupid's dart." When he was sixteen he journeyed into the wilderness to help survey the vast estate of Lord Fairfax, Baron of Cameron. This nobleman was the first to perceive remarkable qualities in the young surveyor, and became his patron and lifelong friend.

Lord Fairfax, with Lawrence Washington, half brother of George, was among the founders of Alexandria, and there are mementos of the two families at every corner. To stroll through its streets is like turning the pages of Thackeray's "The Virginians."

The oldest dwelling is the Ramsay house, built in 1751. Mrs. Ramsay was a Washington, and frequently entertained at dinner her cousin George and his wife Martha. It is a charming little home in spite of its age, with dormer roof and gable windows. One can more easily picture Mrs. Washington a guest here than the mistress of many lands. I am sure that the music of the dancing class which met in the front room did not disturb her, nor the rollicking laughter of the young folk, among whom Sally Ramsay, Sally Carlyle, and Patsy Custis, her own daughter, were the belles. She and her husband often attended the assemblies by candlelight at the Royal George. Jefferson praises Mrs. Ramsay as one of the most patriotic women of Virginia. When Congress neglected to raise money for the army, Mrs. Ramsay collected thousands of dollars through the South for the benefit of the soldiers.

More pretentious than the Ramsay home is the Carlyle house, built by a Scotch merchant who married a Fairfax. It stands, it is said, on the foundations of an old fort built a few years after the coming of Captain John Smith in 1638. This house was one of the great social centers of Virginia. Here Washington, a young man, was introduced to General Braddock, and here, on the balcony overlooking the Potomac, he whispered sweet nothings to Sally Carey who, all unheeding, gave her love to a Fairfax of Belvoir, just below Mt. Vernon. Jefferson, Franklin, John Paul Jones, Aaron Burr, often resorted here, and, in the gloomy vaults of the cellar, the Hessian soldiers were imprisoned before they were set to work paving the muddy streets with cobblestones which still remain.

The most noted of all the colonial landmarks is Gadsby's Tavern, called, until 1792, City Tavern. Coaches started from its courtyard for Philadelphia, New York, and Boston, and south for Williamsburg, Richmond, Charleston, and New Orleans. Its stables were full of horses and outriders bearing messages from colony to colony. Lafayette and Baron DeKalb stopped there on their way to join Washington. They were having some difficulty in ordering a relay of horses when a stranger, John Paul Jones, stepped forward to help them.

Before the arrival of Braddock, in 1775, Washington had his headquarters here, recruiting his first command and starting out on his first expedition to confer with the French and Indians on the western border. From its steps he delivered an address to his neighbors before leaving for his first inauguration. Here, in his youth, he danced merrily in honor of royalty at the famous "Birthnight balls," and here he attended also the first public celebration of his own birthday, in 1798.

But the old Tavern, with its plain front of dark red brick, almost sullen in color, revives few jovial associations. More in keeping with its somber aspect is the story of the "Female Stranger," a mystery as strange as that of the "Man with the Iron Mask" in Europe.

One evening there arrived at the inn a gentleman and a lady, very ill. The gentleman gave no name and issued his orders in the fewest possible words. After the death of his companion he purchased a lot in St. Paul's churchyard and erected a tomb, nameless, but bearing the following verses:

> "How loved, how valu'd once avails thee not,
> To whom related or by whom begot,
> A heap of dust alone remains of thee,
> 'Tis all thou art and all the proud shall be."

There is also this verse from Scripture:

> "To Him gave all the Prophets witness that through His name whosoever believeth in Him shall receive remission of sins."

Today the tomb is surrounded by an iron rail, and is known as that of the "Unknown Female Stranger." Some have tried to connect the lady with royalty while others have conjectured that she was the daughter of Aaron Burr, whom he mourned as lost at sea.

During the latter years of his life Washington frequently dined at Gadsby's when he was in town on business, and from its doorstep he issued his last military command to his own company of "Independent Blues."

Washington was never above helping in town affairs. At one time he was trustee of Alexandria and he urged that it be kept clean, but it was not until 1793 that hogs and geese were deprived of the freedom of the streets. He was anxious that the public market be of excellent quality and sent vegetables from his own garden at Mt. Vernon, insisting that the scales be of standard measure. He gave a fire engine to the town, and, when quite an old man, he jumped from his horse and went to work at the pumps, rebuking others who stood idly by. Alexandria was his post office and his voting place. The townspeople affectionately called him "the General." They were his friends in life, they formed the escort for his funeral, and members of the Alexandria Lodge of Masons performed the last rites at his grave.

Alexandria-Washington Lodge No. 22 was founded in 1788. Governor Randolph signed the charter and Washington was the first Grand Master. Today the lodge possesses and uses, on special occasions, many of the appurtenances of that time, the Chippendale chair of mahogany inlaid with white holly in which Washington sat, the lesser lights, and the hourglass. In addition, there are many relics of the first Grand Master, his wedding gloves, his pocketknife, a gift from his mother which he carried fifty-seven years, his pruning knife, and the trowel with which he laid the cornerstone of the Capitol. There is also the clock from his bedroom at Mt. Vernon which still marks the hour of his passing, twenty minutes after ten. Dr. Dick, who was in attendance, cut the cord of the pendulum when the General breathed his last.

Most priceless of all its possessions is the Williams portrait of Washington, painted when he was 63 years old. The Lodge ordered this picture and Washington sat for it and approved the likeness, and indeed it portrays a man, not the benign cherub of the popular ideal. There is no especial beauty. There is the scar on the right cheek and the roughness of the skin left by smallpox, but there is also the soul of one who passed through great struggles alone, who suffered the desertion of friends in the hour of need, but whose purpose and indomitable courage bore its burden to the end.

Washington had few intimate friends, but in Alexandria there were men whom he knew and loved all his life. It is a pleasure to walk by their houses and to realize that these are the dwellings of the wise and the true.

On Duke street is the house of Dr. Craik, the companion of Washington from youth. He went with him on his expedition to the Ohio Valley under orders from Braddock, and in the Revolution he stood by in every battle. He dressed Lafayette's wounds, was with Mrs. Washington's son when he died after Yorktown, and he attended the General in his last illness. On Prince street is the home of Dr. Dick, a Quaker and a staunch friend. He officiated when Washington laid the cornerstone of the Capitol and was Grand Master at his funeral. On Cameron street is the Lee house, the home of madcap "Light Horse Harry."

Time has dealt very gently with Alexandria in preserving for us so many memorials of a time long past. Washington founded here the first free school in Virginia and the building is still a public school. The old drug store, Leadbeater's, which he patronized, is still flourishing, as is the Alexandria *Gazette*, the oldest newspaper in the country, which recorded at the time of the General's death that the sad news produced "dismay and consternation."

Two of the pallbearers at Washington's funeral are buried in the yard of Christ Church. This was his own church, where he attended regularly and of which he was at one time a vestryman. His pew remains as he sat in it, with that of Lee a few seats back, while the altar rail, the chairs, and the chandelier are of that day. At the church door, while talking with some friends, he publicly expressed the opinion that the colonies should not submit to George III. After the war, when irreligion and skepticism were the fashion, he never failed to express his belief in the need for a spiritual life.

Woodrow Wilson, Man of Thought

What He Meant by His Famous "Peace Without Victory" Declaration

By HUSTON THOMPSON

Copyright, 1924, by Huston Thompson. All rights reserved.

This is the second of a series of articles giving intimate glimpses of the life of the war-time President.

(C) Harris and Ewing.

WOODROW WILSON.

WOODROW WILSON'S characteristic trait of thinking a thing through before acting, but of refusing to turn back after he had made his decision is well illustrated in his famous "peace without victory" speech. I do not know the precise time that he decided to make a drive, by entering a wedge between the German people and their government through the series of notes that he wrote, but it must have been sometime before the date of his "peace without victory" address. His strategy contemplated a rear attack on the German Government while the allied arms were attacking on the front. In this rear attack, through notes which were given more publicity than has ever been given to an utterance of a human being, he hoped to break down the confidence of the German people in their government. If this were successful its effect would eventually reach the morale of the army at the front and undermine it.

He also saw that which few persons realized at the time, that if a break did come on the front, the tension and bitterness that was being aroused among the Allies would be so great that acts of vengeance might be wreaked on the German people, in addition to the destruction of their army. This he feared would only make for future wars.

As these possibilities unfolded themselves, after many solitudes of thoughts on the subject, he came slowly to the conclusion that the only way to avoid such a result was to have a "peace without victory," so he flung out this famous phrase in a speech before the Senate on January 2, 1917.

It will be recalled that in this address he had declared for a league of nations and a "peace that must be grounded upon Democratic principles." There were to be no more conquests by force nor bartering of unwilling populations. Such a peace must be guaranteed by a league of all the nations and if America was to become a part she must be given assurances that it was a peace that was worth guaranteeing. Then he compressed the whole idea into the phrase "peace without victory."

Probably no words uttered by President Wilson ever caused so much debate, query, and criticism, yet as far as I am able to learn, he never deigned to offer any other explanation than was contained in his senatorial address until shortly before his death. It came about in this way.

In the autumn of 1923, I had returned from a trip to many countries of Europe. As I observed the people struggling to arise from the depression and destruction of the war, this phrase "peace without victory" kept recurring to me. On my return I wrote Mr. Wilson telling him how his language had seemed to fit the situation that I saw in many countries, and hence kept bobbing up in my mind. The only countries which seemed to have a peace without victory were those nations such as Finland, Czecho-Slovakia, and the republics of Esthonia and Latvia, where for the first time in hundreds of years they were enjoying the exercise of their own spiritual and national aspirations; that in England and France they had peace of a certain kind but without victory and that in Germany they had neither mental nor spiritual peace nor victory. In view of these observations, I asked him just what he meant by the phrase "peace without victory," and whether it had been thought out before he uttered it. In reply he said:

> "The phrase, 'peace without victory,' was intended by me as a warning against a vindictive triumph such as too many seemed at that time to desire as an outcome of the war. Their idea was to punish the Germans and not merely to put a final check upon the reckless and arrogant German Government. What I meant to say, therefore, was we must beat them for the sake of the principles involved but not in order to humiliate and destroy them."

In the light of the recent discussions on the subject of peace that have been held at Geneva where the words "peace without victory" have been used constantly in describing the present European situation, it would seem as if Woodrow Wilson had coined a prophetic phrase.

The interesting thing about the character of Woodrow Wilson is the manner in which he kept silent and was willing to let the future reveal what to him seemed obvious about this language. He undoubtedly intended to fashion it in a way that would set people to discussing the words, and through discussion, he hoped to make them attempt to consider and prepare for the future. Moreover, he probably calculated on the rebounding effect of such a phrase in quickening the debate on the means of bringing about a world peace. At any rate, while the phrase was being battled about by friend and enemy, having detached his personality from it, he watched with keen interest its effect. Trusting himself when as Kipling says "men were doubting" him, he was making "allowance for their doubting, too."

There were some subjects to which Woodrow Wilson constantly hearkened in his speeches from his college days to the end of his public career. One of these was "responsive government," as he phrased it in his professorial lectures, in his campaign days and in some of his books.

As far back as 1893 when I first met him, I found his mind thinking about responsive government. It had fallen to my lot to help select a subject for commencement debate at Lawrenceville Preparatory School, an academy located five miles from Princeton. In search of a subject, I was brought in contact with Professor Wilson through my brother who was attending the university at the time. When I stated my troubles to him, he suggested almost immediately that we debate the subject of *responsive* government in America. He added that he thought we could bring out its strength and weakness by comparing it with the British system of government. His interest did not stop with the mere suggestion of the subject, but he went so far as to give a list of books that might be used in preparation for the debate. Is it any wonder that government and its *responsiveness* having been uppermost in his mind all these years, he chose for his battle cry during the 1913 campaign, the phrase "new freedom" as it applied to government?

Once in the heat of political battle, Woodrow Wilson's mental tactics bore considerable resemblance to those of the late John G. Johnson, well-known Philadelphia lawyer, who was noted in his arguments before the Appellate courts of the United States, for giving little if any heed to his opponent's side of the case. His tactics usually were to select the one point which he thought was the most formidable and important to his side, bear down upon it with emphasis and give little recognition to his opponent's argument. The records of our courts indicate that Mr. Johnson's methods were in the main very successful.

Likewise Woodrow Wilson after he had given thorough study to the principle involved, and to the location of the battle ground, would concentrate on the forces which he could bring to the attack and did not like to spend too much thought on his opponent's strength. This may have been due to a consciousness that his lively imagination might permit a fear to creep in that would undermine his own confidence.

In the 1912 campaign his attention was called to the situation in one of the politically important states where the opposition seemed to be strongly intrenched and the personality of the Democratic candidate for governor was thought to have weakened the cause and hurt the chances of the national ticket more or less. In the discussion that followed in the Governor's private car, those present urged that something be done to bolster up the weak spot. This discussion led to a long debate on the strength of the opposition, and the thought was emphasized that we should not underestimate it. The writer having had some experience in coaching football teams back in the nineties was in the act of suggesting that whatever success he may have had in that line of endeavor could be attributed to the fact that he never discounted the strength of the other side, when suddenly Governor Wilson, who had been listening to the debate in silence, broke in with some warmth, and took a diametrically opposite position, saying:

"I don't believe in this idea of dwelling too much on the strength of the opposition. There is too much danger of undermining your own morale. The time for considering the opposition is before you get into action. Once in the battle, I believe in dwelling entirely on the strong points of your own side. In thinking of the other fellow's powers, you will discount your own, or lead other people to think you are doing so."

I have said that Woodrow Wilson browsed around a subject before he closed his mind on it. As he grew in political stature, he expanded this habit of thinking a thing through before he started into action, and once he openly advocated a cause, he believed in bringing every legitimate resource to its aid.

No one realized the necessity for educating the masses on a subject before launching a political policy more than did Woodrow Wilson. How he ever sensed this practical necessity in political action after having lived the cloistered life among intellectuals is a mystery. It must have been a thing born of his Scotch caution and instinct. In 1914, this phase of his character was revealed to me in a way that brought surprise.

It is an historical fact that long previous to his political career and during it, he was a great advocate of civil service reform. In fact, he had been a leader in this movement during his presidency of Princeton University.

When I approached him on the possibilities of legislation that might improve the position of the great army of Civil Service employes in the government, he gave immediate, sympathetic, and studious consideration to the plans presented. To those who have given any consideration to this question, a comparison of the opportunities for promotion and methods of promotion in the Civil Service as compared with opportunities for advancement in our Army and Navy, or the British Civil Service where the humblest individual has at least a chance of reaching knighthood, and receiving magnificent emoluments, this "waiting on dead men's shoes" for advancement in American Civil Service comes as a shock. Moreover, the result of our system produces a deadening effect, despite the fact that there are

(C) Underwood and Underwood.

Where Woodrow Wilson looked out from his sick room.

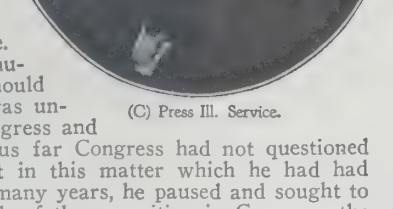
many public servants who on meager salaries render signal service to the government.

My plan contemplated the advancement of Civil employes automatically after passing annual tests successfully, increase of salary upon advancement and presidential recognition of those in the service who had accomplished or performed some great work or act for the government and the public.

Our interview again took place in his study in the White House. At this time, the President was in a marvelous physical condition, the result of the care of Dr. Grayson. He was in an exceedingly happy frame of mind owing to the fact that his legislative program had been put through with a success that astonished even him.

When I had laid the matter before him, and we had discussed in detail the kind of machinery that would be necessary to carry the plan into effect, he leaned back and, seeming to project his mind into the past, said: "You are no doubt aware of my position respecting the Civil Service. Long ago, I became one of its advocates and since I have been in the White House I have jealously guarded my discretionary power in making executive appointments. In fact, I have made fewer of them than any of my predecessors during a like period of time. So far they have numbered less than a hundred and the Senators in our party have become so disgusted with my strictness in this matter that they have about given me up as hopeless. Now while I am keen for action, I am wondering whether you have given full consideration to the treatment that a bill such as the one you suggest would receive. How about our Democratic southern members who are not enthusiastic over the Civil Service? What support would they give? You know that there are some Senators who would welcome the opportunity of destroying everything that we have gained in all these years in this reform. In order to get a sufficient backing from the public that would override the opposition, it would be necessary to have the masses educated up to the necessity for the changes you suggest. Would we, without a period of discussion and instruction, be able to crystallize public sentiment in a way that would be effective in Congress?"

As he flung these questions at me, I saw this President, whom but a short time before many with sardonic words had charged with being only a professor and an idealist, in a new light. Here was a leader who had put through more constructive legislation in a shorter period of time than had ever been accomplished before. By all the rules of human weakness, he should have felt that he was unbeatable before Congress and the country, for thus far Congress had not questioned his leadership. Yet in this matter which he had had upon his heart for many years, he paused and sought to measure the strength of the opposition in Congress, the inertia and ignorance of the public. Finally he calculated the time and study that would be necessary to sow the seed and prepare the way before instituting legislative action. It would take in his judgment twelve months of educational propaganda among the masses before he might dare to throw the strength of the administration behind such a bill. He concluded our interview by saying:



(C) Press Ill. Service.

"Give this matter further consideration and sound out as many people as you can who are accustomed to sense the attitude of the public mind and let me hear from you within the next few weeks."

I followed his instructions and the more I investigated and considered the subject, the more clearly did I see that he had diagnosed the situation correctly. At this juncture, the turn of affairs in the European situation became so critical that Civil Service Reform, important as it was in peace times, could not take up the mind of the President. He was then seeking to sail the ship of state "between the Scylla and Charybdis" of neutrality, and so I sent him a note suggesting that the matter wait for a more propitious time.

Judging from outward appearances, when he appeared on the stump, or before Congress, he was calmness and confidence itself, yet the inward Wilson was a thoroughbred in every sense of the word, sensitive, nervous, eager, sympathetic.

Few people realized the strain he underwent when the mellifluous phrases which sounded the perfection of platform speaking fell from his lips at banquets. When he was on the program for an address, according to his statements, his food lost all its savor and he only went through the motions of eating. While apparently listening to the conversation of those about him, he would drum upon the table with his fingers and from time to time lose himself in thought as he gazed blankly out over the audience, meanwhile building up the words and phrases that were to surround his forthcoming thoughts. He was punctuality itself in keeping his engagements, and if for any reason the gathering or dinner was slow in getting under way, he was like a race horse at the barrier.

Back in 1911, it fell to my lot to introduce Mr. Wilson at a gathering in El Jebel Temple in Denver. Never

was there a more enthusiastic gathering assembled. It was almost entirely composed of college graduates with each college having a table of its own, and more than thirty colleges represented. All were alive to the record that Governor Wilson had made as President of Princeton and Governor of New Jersey and as the occasion had been worked up by tremendous publicity, they awaited the entertainment of the evening which was to be chiefly an address by Mr. Wilson on politics.

As most of the men were contemporaries and knew me too well, I was extremely nervous. In searching for sympathy I turned to the Governor and asked: "Do you ever get nervous before speaking?"

"Yes," he replied with considerable feeling, "I usually do."

Not having expected this reply, as he seemed so certain of himself at all times before the public, I pressed for a reason, saying that I could not understand how so experienced a performer could have any fear of forgetting his subject.

"Oh, it isn't the fear of forgetting which makes me nervous, and I no longer rely on my memory," he answered; "in fact, I have little confidence in it since I do not have a good photographic memory. Moreover, my mind has a trick just when I am about to utter memorized phrases of suggesting that I rearrange them. This has the effect of upsetting my train of thought or making it halt. No, the thing which makes me nervous is an idea that when people come out to hear me, I am under obligation to tell them something worth while. It is the fear that I may fail to get my ideas over that sets me on edge for I never can tell until I am on my feet and looking into their faces whether I shall be successful."

When he became President and arose to supreme heights of oratory, he told me that he found the fear of saying a thing which might be misconstrued to be a dreadful strain.

During the 1913 campaign one morning he had begun his speaking at eight o'clock, and before facing an audience of about twelve thousand persons at eight o'clock in the evening, had made ten political addresses. The evening engagement was the main one of the day. I had arranged a small dinner of party leaders in honor of Mr. Wilson at a hotel. It fell to my lot to see that he should be on time for the coming meeting. During the dinner Governor Wilson frequently turned to me and asked how soon we would start for the hall. When we finally left the table and were coming down in the hotel elevator from his room, he said with perceptible worry, "Somehow my mind will not work tonight. I cannot think of anything to say." This was due no doubt to his having been on a continuous speaking tour for many days which, with the work of the day, had brought on great mental fatigue.

As we approached the auditorium, we saw thousands gathered outside. Inside, not only was every seat taken but the aisles were jammed, and the atmosphere so close that during the evening several women fainted.

As the roar that greeted Mr. Wilson's appearance on the platform subsided, and the audience cut short the introductory speech by suggesting all sorts of methods of retreat for the one introducing him, the Governor stepped forth. Then a strange thing occurred. Here we were in the height of a political campaign with partisan lines drawn tightly and an audience eager to respond to a blood-raw attack, and hoping that the enemy would be quartered by the speaker. Almost any kind of an assault on the opposition would have unleashed the partisan enthusiasm that was pent up.

It is said that frequently when a prize fighter appears overtrained that he has left his best fight in the training quarters. Just so with Governor Wilson, who, having already spoken along political lines on ten different stops during the day, had evidently left his fighting spirit behind and could not make the political grade that night. The more expectant the audience became in its hope for a chance to applaud an attack the farther Governor Wilson seemed to drift away from such an idea.

Somehow the thought that he was on the brow of the Continental Divide had caught his will in its grasp and set in motion a train of ideas that would not let him descend to political discussion. That night he was lifted up to the very heights of idealism for America and its place of service in the world.

To one who knew him well, it was plain that there was a conflict going

President Wilson addressing Congress.

Dollar Diplomacy—What Is It?

International Tangles Straightened Without Blather and Bullets

By A. R. PINCI

TIME was, not so very long ago, either, when even our changing presidents did not disturb foreigners beyond a few lines of news, whereas nowadays the mere shifting of certain officials jolts them—and volubly so. More or less subordinate departments, commissions and bureaus cannot suffer a change of personnel now unless both great powers and little nations feel, or pretend to feel, its effects.

For the day has come, by destiny's little joke, when no foreign official can successfully weather the storm and strife of his own bailiwick without American cooperation. That sounds unbelievable but nevertheless is so.

"What are Americans going to do about it?"

"What is the United States thinking?"

"Will America co-operate or object?"

Intrinsically those questions have become to foreign diplomacy what "Watch your step!" means to subway passengers. One reads them in the newspapers every day; one is sure to read of diplomacy's failure unless by and with the aid of the United States. This aid is all the more conjured with and sought and urged because so sparingly and carefully doled out.

There is no doubt whatsoever that ambitious or aggressive American hands could have made the United States a greater power, in point of force and arbitrariness, than we are today. This statement is made here especially for the benefit of those who assert that this country is cruel and exacting toward debtors dislocated by the war. It should be remembered that any other power in our place would not only have imposed more severe terms on the enemy but also decreed a secondary status for her associates. Be it understood that the United States had no allies in the war, and this term popularly prevailed because of its brevity, a no mean fact and influence in misinformation unwittingly caused by the exigencies of newspaper-making. A case in point will prove it.

In our foreign affairs there is a generic term today known as "dollar diplomacy." A few years ago it was a very popular byword; suddenly it became an object of obloquy.

Dollar Diplomacy is the idiom that put the State Department on the front page of newspapers, after the Portsmouth Treaty was forgotten, and kept it there until other agencies helped to make space. I may say that I am the newspaperman responsible for this popularity. The Taft-Knox foreign policies became famous the world over through the instrumentality of a phrase that could be discovered in newspapers of every language, and I found it so in Berlin, Paris, London, Rome and elsewhere at the very time that political stigma began to attach to it here in America.

In the office of the Secretary of State I have interviewed, but seldom for publication, Hay, Root, Knox, Bryan, Lansing and Hughes. I had popularized Knox's diplomacy before I met him, because the key to it had been furnished to me years before by William H. Taft, when he was Secretary of War. In turn Secretary Knox reciprocated by granting an interview for publication which bore the title of "The Achievements of Dollar Diplomacy," he officially adopting the title that I had devised journalistically. A year or so afterward Secretary Bryan, his successor, acquainted me with the fact that dollar diplomacy was thenceforth dead and would stay dead. Thus it was my peculiar and amusing privilege to witness the official birth and official death of a compound word that bore no relation to the thing described other than that which any name bears to the thing carrying it.

Secretary Bryan evidently did not distinguish between hypnotism and death. Despite the Wilson Administration's attempts to destroy dollar diplomacy, it was at this political period that it grew more dollary than ever, outgrowing its natural parent of 1910, so that by the end of 1924 thirty foreign governments had borrowed money in the United States since and independently of the war!

Thus what is Dollar Diplomacy?

In 1905 Mr. Taft read our foreign policy in these words, in the course of an interview I had with him:

"Our relations with foreign peoples, in these days of friendly commercial intercourse and competition, consistent with the principles and ideals of our government, should none the less express a logical and beneficent program in which American dollars must perform a high moral duty."

What is, and was, that duty?

Here is how Secretary Knox described it to me:

"Our diplomacy, when not directed toward the reconciliation of the turbulent elements warring or threatening war in some of the smaller and weaker southern republics or otherwise largely occupied in conducting our foreign relations with the nations of the earth and in endeavoring to establish peace among mankind, has found opportunity to advance the commercial interests of the American people in foreign markets, to encourage the use of our abundant means in assisting less forward countries to develop their resources and to advance reforms necessary to national stability and progress in regions aspiring toward a higher civilization."

Following that principle, and although moved by the fact that the United States should not be cheated out of collateral influence, Secretary Knox reasonably demanded of the German, French, and British governments that if their nationals would finance and build railways in China, American rights and American interests in the development of China, based upon the Treaty of 1903, should be duly recognized. After some negotiation the claim of the United States to equal participation with other powers, in all respects, was admitted by the foreign governments and financiers concerned. The project was the Canton-Hankow Railway.

Because it meant the then considerable sum of $50,000,000—a huge treasure in 1910—banking houses were naturally interested, whereupon critics pounced upon this fact that dollar diplomacy was for and in the interests of plutocrats, the malefactors of great wealth, the owners of tainted money.

The failure of that loan, which in later years gave rise to plans about a Chinese consortium that has never materialized, did not hurt American bankers. But its failure did infringe upon the Chinese Government's liberty of action to covenant with foreign bankers for loans on terms that, so long as they were satisfactory to Pekin, Washington could not logically veto. It is true that the bankers of Wall Street, who in turn were and would be responsible to the ultimate consumers, namely, the investing public, would continue to seek "their share of the loan under the proposed agreements only if expressly requested to do so by the government," but what does that mean?

Merely to put the other great powers on notice. What kind of banking would America's be if our leaders underwrote a loan of $50,000,000 and—*without* government protection—consolidated it with equal shares underwritten by foreign bankers *with* government protection?

Privately—and this is revealing some novel views for the first time—it was felt that American bankers of international reputation *might commercialize the government's approval as a selling point*—an item of immense importance in the disposal of securities to the public. How preposterous this conviction was the war itself demonstrated, when the United States Treasury, backed by the whole administration and the emergency of war, encountered difficulties in marketing government bonds—and never did loans go "over the top" until private bankers did it. Dollar diplomacy has been too frequently confused with financial hegemony.

Today the potency ascribed to American participation in international conferences, irrespective of their name and scope, lies in American dollars and not in American opinions. Our moral support unaccompanied by billions of dollars, cash or credit, is immaterial, is not desired.

In this respect our diplomacy is easy. Foreigners make it so for us, rather than we ourselves. A very well-known foreign official—to whom a few of us independents would not voluntarily concede the title of statesman by which he is generally known—said recently that "the wise diplomatist will recognize that our reputation in America is of greater importance than a temporary advantage in Europe and Asia."

But that does not mean, of course, that the foreign diplomacy should recede into the canonical or evangelical, as it has been at times.

It is only ten years since the byword of Washington diplomatists was:

"Hurry, get the prayerbook, we are going to the State Department."

Now the European cry is:

"Hide what you don't want seen, because the American observers are coming."

Perhaps the greatest fault with our diplomacy is that we have patterned it too finely after the European

(*Concluded on page 15*)

Woodrow Wilson, Man of Thought

Concluded from page 5

on in his mind between the wish to gratify the audience with an attack on those who controlled the opposition, and the desire to make this great audience see the opportunity that opened to America for leadership in the world. I venture to say that there never was such a speech made under similar circumstances. There were many able speakers in the audience that night who were also competent critics and they were almost unanimous in declaring that they had never heard an orator reach greater spiritual or poetical heights, as he called upon the people of the Rockies to guide the rest of the country up the paths of national life among nations to the summits. Yet there was no politics in this speech in the "low brow" sense of the phrase. After forty-five minutes, the Governor closed with one of his most beautiful perorations and a mystified audience slowly turned and filtered out of the hall, leaving the speaker conscious that he had not given them what they had come for.

We made our way out of the hall to an automobile in the rear. As we drove down to the depot to the Governor's private car, in a weary and dejected way and almost in anguish, he exclaimed several times, "Oh, what a miserable failure! How terrible!" His depression could not be softened by words of encouragement and only a humorous incident at the car broke the spell.

Along toward midnight his train was to leave. The usual crowd had been there and gone, and there were only a very few standing around the rear end of his car saying goodby to him as he stood on the platform. Just as the train started, a tall, grizzled ranchman with high boots and Stetson hat came swinging along the platform with something of a roll to his walk. He stepped down between the rails, reached up and grasped Mr. Wilson's hand so firmly that he caused him to be pulled forward as the train moved. At the same time, the ranchman hurried his steps. Then too full of admiring emotion to give utterance to a commonplace, and his feelings accelerated by a few drinks, this plainsman, looking up in mingled agony and admiration exclaimed with intense emotion:

"Goodby! Governor Wilson, Goodby! God damn you!" and let go the Governor's hand. The situation was too much for the latter. Whatever disappointment he may have felt over his speech gave way to uncontrollable laughter, and as his train was swallowed up in the night, I could still hear sounds of merriment. The plainsman whose tongue had tripped unconsciously over the phrase "God bless you," well satisfied with his farewell, retraced his steps, muttering words of praise. Frequently afterward, Mr. Wilson repeated this story to friends and cited it as the most humorous incident that had ever occurred to him in public life.

But if Mr. Wilson's mind sometimes refused to come under the spell of his will, there was one combination of circumstances that never failed to synchronize his will and his imagination. That was when he was facing an audience that was hostile or in opposition. It was then that the subconscious Wilson revealed itself, and he rose to his greatest heights. Opposition, undoubtedly, was a thing that his abilities fed upon, and, had it not been that his life was one continuous effort to surmount opposition and obstacles, he would never have reached the immortal heights he attained. In his college days, if he had been a football player, he would probably have made a poor showing in practice games where only the scrub was to be beaten back.

An unexpected situation in the pre-convention campaign days of 1912 offered the kind of opportunity that President Wilson delighted in. In the State of California, both parties contained hostile camps. In each there was a progressive and a conservative wing, and when Governor Wilson was making a tour that was not partisan so far as parties were concerned but in which he was arraigning those who were enemies of the government generally, he was captured by the conservatives in San Francisco who executed a coup which had left the progressives out in the cold. The conservatives were to have him as a guest of honor at the Fairmount Hotel. Those who were in control of this occasion numbered among them a group who represented the special interests and monopoly. They saw to it that when the invitations came out there was a complete absence of progressives. The situation was extremely delicate for Mr. Wilson. While he was not an avowed candidate for office, his political future was being weighed in the balance and there was the possibility of the Presidency.

Because of his early Princeton connections and views, there was somehow a lingering idea that despite his progressive actions as Governor of New Jersey, he was not a simon-pure progressive. When the information reached the Governor that the progressives would be on the outside, he at once determined that if they could not get in they at least would not lack comfort. Knowing that representatives of special privilege would be there in numbers, he had the very incentive needed for the type of speech that he made. That night he delivered an address that is a classic in its description of the trend of modern business corporations that seek to remain just "within the law," or go beyond it in their desire to monopolize industry. It is fortunate that this speech was taken down in shorthand, and is still in existence. It should be reprinted and scattered throughout our colleges and institutions of learning, among our farmers and labor organizations, for there never has been a more enlightened discussion of this subject, so prominent in the business world today.

The speeches of Woodrow Wilson on the subject of the interplay of the special interests in the business world leave one like the writer, who has for five years had a close-up observation of their actions, in amazement as to how he could have obtained such a realistic understanding of the subject, as he showed immediately after leaving the cloistered university life.

The anatomical way that he handled it that night in San Francisco with a dissecting scalpel that laid bare the fibrous growth of monopoly in our markets, under laws which permit men to come together in artificial groups called a "person," and exercising most of the privileges of a natural person without being subject to many of his responsibilities, was superb. He left no doubt in the minds of his hearers as to whom he was hitting. Even the materially blind had the mirror held up to them in a way that revealed the unfair advantages taken by artificial growths such as some of these corporations had developed into. Yet no one present could dare take open offense at what was said.

Woodrow Wilson knew before he arose that night that he was going to surprise his audience and some of them unpleasantly, and that he would probably not be the recipient of much applause. Yet there he was rejoicing over the opportunity of meeting monopoly face to face and letting it know how contemptible he thought its practices were.

It would have been very interesting to have sat at the breakfast table the following morning with the progressives who did not get an invitation to that banquet but who read what was uttered there by Woodrow Wilson. Suffice it to say his appearance in California was not soon forgotten, and the lasting impression of that speech not only affected the 1912 campaign but etched itself on the minds of the progressives in California in such a way that it had an influence in the 1916 campaign.

Mr. Ford's Page

IN LAST week's Page it was said that "it is man's immoral reactions to Progress that change his progress to be his doom," and, "modern progress is the test of our ability to attain a moral greatness equal to our other achievements." The idea is that Progress tests the people.

This idea is not doubted, indeed it is confirmed everywhere. But wherein does Progress test the people? Physically, in their muscles or their nerves? Mentally, in their brain power? These tests have been met and easily sustained—muscularly and nervously men are better equipped today, and brains are more than common, although a sustained and systematic use of them is not.

The records of the dooms that have overtaken progressive peoples do not indicate that they fell through physical or mental failure. They collapsed morally. "Prosperity was too much for them," as we sometimes say of individuals. Too much for them in what way? Too much for their moral balance; they could stand it physically, mentally, but they could not stand it morally. They went to pieces through their inability to permit the moral law to become constructively operative in their life, and the natural consequence was that it became destructively operative. That is one thing we know about the moral law—it operates; for us, if we will; against us, if it must; but it operates.

There exists in our day the pretense of a curious prejudice against any view of life that presupposes moral laws or values. It may be the word "moral" that is objected to; it conveys a wrong meaning, and no wonder, so badly has it been misused. Like the word "ideal," the word "moral" has been made to serve as the opposite of "practical." However, it is not the opposite of practical, for until it is recognized as a basic element of the practical, then what we call practical is of all things most impractical. For nothing "works" unless it is right, whether it be a matter of machinery or men. Unless the relations and proportions are right, they become ineffectual and self-destructive. Human relations are no exception to the rule.

The difficulty has been that so many people have thought that the term "moral" meant something like "trying to be good." There is a very understandable and somewhat healthy protest against the idea of merely "trying to be good." *Good for what?*—that is the vital end of it. An average experience of men convinces us that there are many very good persons, undeniably good persons, who nonetheless are "good for nothing."

And again the term "moral" carries with it a sense of sacrifice, as if the gain would be much larger or the opportunity more promising, if only one were not required to be so moral, so good. The ethical value is treated as if it diminishes the material value.

This is an entirely wrong view. Wrong, in the sense that it contradicts the facts. There are no material values where there are no ethical values. Look at Central Africa. If material values are ever recognized there, it will be because of the arrival of people who have ethical values. The thief carries off value in his hand because the ethical qualities of the unthieving community have given value to what he carries. Without that, his loot would be rubbish. We may talk about the materialism of the world all we like, but you never see material values except where there are ethical values; the barbarians and savages, who are pure materialists, suffer a lack of all materials.

There was a word once spoken which throws light on this: "Seek ye first the kingdom of heaven, and all these (material) things shall be added unto you." That is in the Sermon on the Mount. It does not mean religiously trying to save one's soul and get it into heaven; it means what it says, the reign, the rule, the law of the highest relations. Get that, work by that, and you have the world—a world without poverty, without injustice, without need.

Will the poverty and injustice and need of the world be a pressure to force us to adopt this law of the higher relations? If so, fortunate are we. If not, it will be the ancient doom of those who failed to bring human interior progress up to a level with exterior progress. The human race is absolutely unnecessary to the existence of this planet, which can get along without us; its use to the race seems to be the giving of experience; and unless experience enables us to progress in human relations and in the establishment of social systems which will "work" in the equal service of all, then the purpose of progress has failed.

So that when we speak of "morality in progress" we mean the maintenance by man of his control of the situation, not his being overwhelmed by the situation. We mean that he shall mold progress to his highest concepts of what is "right" between man and man and what will "work" for the service of all; and not merely consent to be molded out of moral shape by the pressure of progress upon him.

Now, a man can make a soap, or a phonograph, or a car, or a gas, or a magazine, and he can say, "I want to make the best article I can, of equal quality all the time, easily procurable by all who want it, and all so good and satisfactory that people will never want anything but my product." Would you say that he was showing morality? No, you would say that he was just showing sound business sense. Well, that is morality. If the man had said, "I want to make a soap that will cheat and injure every purchaser, of unequal quality, hard to procure and never wanted again," we should not stop to consider his morality but his sanity.

Morality is doing the sound thing in the best way; it is the larger view and the longer view applied to life. For what we are doing is not making this or that, we are making life, and the opportunity of life, and the conditions of life; and the measure of our morality is the measure of our wisdom—how well are we doing it? Let us say of life as we say of soap—"We want to create for everybody the best life conditions possible, a high level of possibility and opportunity for all, a satisfactory life easily procurable, and one that people will be glad to live and bring their children into"—and we are merely applying sound sense to life. It is the highest morality, but it is not merely "trying to be good."

The heart of the matter is that this is the only way that life can be made. The advantage of what we call the "moral" is that it is the "natural"; it represents the way that life must go if it is to go at all. Morality does not represent a saintly and sacrificial effort to bend the bad natural to the unnatural good. It is the bad that is unnatural, because it will not "work." It is the good that is natural, because it will work. Morality is a part of good management. The good manager may resent the word as applied to his work, he may retort that it is only common sense; but that is what morality is, the plain, practical development of life according to its nature.

The signs are that we shall recognize more widely than other civilizations this pressure toward morality. Nations and civilizations are not destroyed because they do not see the need and place of the moral view of Progress, but because, having clearly seen it, they reject it. We have not yet done that. We are, on the whole, quite receptive of the moral implications of Progress, and we are waiting mostly for demonstrations that it can be done, and how. These demonstrations are more numerous now than they have ever been in all the ages of mankind. Whether we name the movement moral or not, morality is surely moving to practical recognition.

THE right way is the only way, and the rightness of an attitude or method goes down through all its relations. Rightness in mechanics and morals is basically the same thing. We make a great error in regarding "moral" as meaning "trying to be good"; it means trying to be right. Unless the parts of a machine are right, power cannot be delivered, service cannot be rendered. The only kind of precision that fits society together is moral precision, which is the science of right relations. We make no progress as long as we deny this. Our motive in this is not the attainment of some kind of goodness which is apart from life itself, but the attainment of inherent rightness so that this complex instrument which we call society may efficiently function. Morality is the mechanics of rightness.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Our "Diplomats"

GREATER frankness, and more willingness to instruct the people in the points at issue, must characterize the Department of State to prevent ugly misunderstandings in this country. The Department was recently jarred from its pontifical attitude and spoke twice to the people (without looking at them), but the distance was very great and the frigidity extreme. The feeling persists that even though our signatures at Paris do not involve us, the opinion of Europe is that they do. If we say they do not, as our Department of State has said, then they do not; the signature of the United States never means any more than we say that it means. But Woodrow Wilson would have met this point in a better way: it comes to mind what he did when we were trying to "interpret" the Panama Canal Treaty in such a way as to make it mean what we wanted. Woodrow Wilson's words on that occasion should be carved on the walls of the innermost office of the State Department, as the principle which this Republic must follow in matters of this kind.

The conviction grows that the United States is better off on the old lines of its diplomacy, when it made no pretenses to skill or style. It begins to seem as if our importance in world affairs were having the effect of throwing us off that old-time balance by which we came to that power, and that we are not cutting such a swath in professional diplomatic circles as we seem to think. We notice that it is the other boys who regularly go home with the bacon, and that our men have to be satisfied with "recognition" and "acknowledgment." This would be perfectly all right, if we did not attempt to make it appear to be something else. Our diplomats would be just about as we desire them to be, if they were not so easily moved by the older hands abroad to believe that they are real European diplomats. We don't want real European diplomats in our affairs. We want American representatives of American common sense. The old shirt-sleeves diplomacy did not possess a very taking name, but it represented something that was American and that was respected for its individual character and strength. In other words, it would not be a bad thing if Calvin Coolidge would rub a little Vermont soil on the hands of our diplomats and inject a little Vermont sap into their veins.

Child Labor vs. the Amendment

THE case against child labor has been won, but the miscalled Child Labor Amendment to the Constitution has been lost. The dishonest efforts of the proponents of the amendment, to have it appear that opponents of it were actuated by a desire to exploit the labor of children, have failed and the truth succeeded in getting itself heard in time. The people of this nation are heartily tired of passing up all their duties to Washington to perform (the Government having so many duties now that it performs most of them badly), and they are tired of trotting out their Constitution every little while for remodeling at the hands of those political women who have proved to be the easiest way of ingress for alien ideas that masquerade as socially ameliorative but which in the end are perversive of American rights and destructive of the American tradition.

Weightiest of all, of course, was the instinctive resentment of the people against handing the direction of their children over to Congress until they became 18 years of age. Americans simply will not do that. It is easy enough to comprehend the state of mind in which this proposal arose—in the childless, sovietized, de-Americanized minds of overexcited feminists; but it is next to impossible to understand how such a proposal got past Congress.

Does Congress want to take over the direction of children until they are 18?

Ask Congress. Poll Congress. Congress says NO! Then why did Congress propose it by submitting the amendment? Because of pressure—from women who pretended to "represent millions of American mothers," but who do not. Such mothers as have been led on humanitarian grounds to approve the amendment, think that the law will apply to *some other mother's children, not her own;* the children of the cotton country, or the mining country. *But it will apply to your children—everybody's children.* That is what the people will not stand. A country that would brook no interference with its tea will not tamely submit to hand its children over to any political authority.

"But," say our women lobbyists, "can't you trust Congress to do the right thing?" No—for this reason: put this amendment across and the next thing would be the handing over of its authority to a new department of government comprised of these same women who sponsored the amendment. If Congress kept this authority in its own hands, the people could make themselves felt against aggression. But Congress will get rid of the responsibility at once. A Congress that will succumb to pressure in submitting such an amendment will succumb to further pressure as to how the amendment is to be applied. We don't feel like passing the children of America over to a Washington Bureau; the record of the one existing now is a warning against any more.

This amendment has been most cunningly drawn in all its particulars to defeat the people's right of expression on this vital matter. No period is fixed as the time in which it must be ratified, so that it can drag on and on for years, with perhaps ratification won here and there where negative action had previously been taken, and by means which have been exposed as contrary to the mind of American women.

That is to say, 48 States may turn down this amendment today and not settle anything, because an endless period has been shrewdly devised for it. Too shrewdly devised, perhaps, for it may lead to a very definite ruling on this point.

Two things are urgently needed in the matter of amendments; first that they should be submitted to the people, or to constitutional conventions chosen by the people with the amendment in view. Second, a definite period fixed wherein to accept or reject an amendment, after which the proposal, if unratified, is dead.

As for the children of the Nation—the best we can give them is the widest liberty to develop their own careers along natural lines, by study if they choose that, by work if they choose that, with no Prussianized goose stepping and no sovietized regimentation of their budding powers, by a Washington bureau of feminine socialists.

Red China?

A GLANCE at the map will show that Mongolia lies immediately south of Soviet Russia, and that China proper lies immediately south of Mongolia. A Mongolian Soviet Government has recently been formed which has become an integral part of the Soviet Union. Moscow rejoices, for this is part of the dream that the Red International hopes to realize: a World's Union of Soviet Republics, with dictators of mixed Semitic breed ruling its destinies.

Somewhat to Moscow's chagrin, America and the European Powers have not worried much over the conversion of Mongolia; its effect on the world is not immediate nor sensational. The effect on the future of China, however, is an important matter.

There is ample evidence that Moscow has had much to do with the civil strife that has in recent months caused a certain liveliness in the Chinese Republic. Russian officers and men have helped to render efficient the fighting forces, and Russian munitions of war have figured in the fighting paraphernalia. Dr. Sun Yat Sen and his Cantonese are admittedly helped and directed by the Reds, who are gradually extending their influence over a vast territory in the Far East. Let this continue, and it is only a matter of time until East becomes West and North becomes South.

Indeed, what was yesterday Northern China has in a sense become Southern Russia today. The effect of this on the western world, and in the struggles to come, will repay careful observation.

The Hidden Hand in Egypt

BEHIND the unexpected and sensational occurrences that upset the world, there is usually a hidden purpose. The average report records the event without shedding much light upon it. The intelligent reader is never really satisfied that these events are of individual origin or for personal purposes.

The intelligent reader is particularly right in regard to those events which from time to time rob the world of some of its best men. The hand of the fanatical assassin is usually the instrument of some hidden plot. In this way America lost a Lincoln—whose death appears to have been desired on more than military or political grounds—and Europe some of its greatest statesmen.

The *Patriot,* a British magazine, cites the recent shooting of Sir Lee Stack, the Sirdar of Egypt, in the streets of Cairo, as an instance of the power of "the hidden hand." The *Morning Post,* advancing the same idea, says: "The question now animating Cairo is: 'Who is maintaining this gang? Who is instigating the fanatical youths to commit these crimes?'" The *Patriot* gives a brief history of a secret organization known as the "Clarte," which is described as an "Internationale of Intellectual Bolsheviks," on the committees of which are to be found leading members of the Zionist movement. It is pointed out that "when a branch (of the Clarte) was formed in Egypt its direction was placed in the hands of a well-known Jewish Communist and agent of the Soviet Government there. Of the Egyptian Council of Five, three were Jews"—a German Jew, an Italian Jew and a Russian Jew.

The *Patriot* concludes with the following received from one of its correspondents:

> "Among the Bolshevist agents stirring up sedition in Egypt, Jews, as everywhere else, are playing the most important part. 'One of these, the Hebrew who has himself called Rose, but whose name is Abraham Rosenstein, has been arrested and expelled; as also another Hebrew, Salomon Saslawski, and a third. But for three who depart a hundred remain.'"

There is in every country at the present moment an element whose object is to subvert laws and undermine constitutions. This element is composed of men who own no nation and belong to no nation. They are the foci of the next outbreak which will occur in the Orient, involve all powers, and definitely settle some matters that will not yield to reason.

The Younger Generation

HOW is it with our boys and girls, our young men and women? The question has become an anxious one throughout the land. The young themselves begin to feel the perturbation which they cause in their elders. The elders, on their side, begin to wonder whether they are rightly judging their young. Thus it emerges that the two generations are conscious of their being two peoples, and they seek the reason for it.

It follows that children whose playthings are the miracles of motion pictures and radio, who can take a ride in the sky more easily than their forebears could procure a ride in a train, are bound to be somewhat different.

The long approach to mystery and reality has been greatly shortened, in its more superficial aspects, for the young. Some of the reticences which we formerly deemed the mark of rectitude have disappeared, but we catch ourselves with a subtle misgiving when we conclude from this that with the reticence has disappeared the rectitude also. We cannot believe that. One mark of the younger generation is frankness, and this coexists with natural decency. The younger group talks more freely perhaps than its elders did, but that this results in looser conduct has not been proved. The younger group dallies with philosophies which would mean ruin if the poison really took effect, but it seldom does; the young, no matter what their airs may be, are not philosophers. They have pretended to dump overboard some of the old reverences, but it is mostly pretense, inasmuch as one cannot get rid of what one never possessed, and reverence may be a thing pretended rather than consciously possessed by younger minds.

Taking it altogether, Luther Burbank's conclusion, in his article printed in this issue of THE DEARBORN INDEPENDENT, is a natural one.

Mr. Burbank points out some of the dangers, and they are real. But he also points out the possible avoidance of the danger. In any case, Mr. Burbank has a shrewd suspicion that the blackest facts are never true, and he is right. Extremes are always wrong. The truth of pessimism is always temporary. The younger generation will land right side up.

American Libraries Lead in Service

Millions of Rare and Useful Books Available for Use of Citizens

By LOUIS C. KARPINSKI

THE American Public Library is a truly representative institution of our American democracy. In American libraries prevails the finest spirit of service to the community as a whole, from the least to the greatest. The library serves the past by conservation of the written record, the present with books, and the future through the children by inspiring in them a love for books. In service to the whole community, in speed of service to readers, and in placing books in the hands of the multitude, the American libraries stand first among the libraries of the world.

Three centers of American culture contend for first place with respect to library facilities: New York, Washington, and Boston, with Chicago making rapid strides to stand alongside these three. Washington is on record as having more than seven million books in the Library of Congress and other government libraries. The numerous large private libraries of New York would doubtless place the metropolis first, if any fair approximation could be made.

The New York Public Library more than any other great library of the world offers service to the public. Standing as it does at the main port of entry into the United States, this institution of an enlightened democracy is an honor to the metropolis, to the State of New York, and to the Nation.

No library system in America has received over long periods of time such munificent gifts as the New York Public Library. These gifts bear eloquent witness to the love for the library felt by citizens of New York; they indicate an enlightened and progressive management. Incorporated with this institution are three foundations which unite to make the library truly great. The inscriptions above the noble entrance read as follows:

THE LENOX LIBRARY
FOUNDED BY
JAMES LENOX
DEDICATED TO HISTORY,
LITERATURE AND THE FINE ARTS
MDCCCLXX

THE ASTOR LIBRARY
FOUNDED BY
JOHN JACOB ASTOR
FOR THE
ADVANCEMENT OF USEFUL KNOWLEDGE
MDCCCXLIII

THE TILDEN TRUST
FOUNDED BY
SAMUEL JONES TILDEN
TO SERVE THE INTERESTS OF
SCIENCE AND POPULAR EDUCATION
MDCCCLXXXIII

THE NEW YORK PUBLIC LIBRARY
MDCCCXCV MDCCCCII

The gifts of John Jacob Astor and those of his sons and grandsons totaled $1,700,000 at a time when even rare books were comparatively cheap. The Lenox Library was formed by James Lenox (1800-1880), one of the most ardent book collectors of the world, whose library enjoyed for a long period of time the services of the most learned American bibliographer, Dr. Wilberforce Eames, now of the New York Public Library. The Lenox volumes in the field of American history, in particular, are numerous and of fundamental importance. The estate of Samuel Jones Tilden in 1886 yielded to the New York Public Library not only his large private library but also an endowment fund of two million. In 1909 John S. Kennedy left some three million to the endowment fund which was augmented during 1923 by six million further, the gift of John D. Rockefeller, Jr., Payne Whitney, and Edward S. Harkness. No other library of the world is today so well endowed as the New York Public Library; and no library system returns more to the great public.

Oval—Library of Congress. One of the most majestic buildings of the world and a treasure house of learning. Below—The Distribution Room in the Library of Congress. Arranged for the convenience of the readers.

As far as the branch libraries which serve the city of New York are concerned the most notable gift was by Andrew Carnegie, patron of learning. In 1901 Carnegie contributed $5,200,000, which enabled New York City to build thirty-seven fine branch libraries. Through these and the great Central Building, the New York Public Library achieves the proud record of first in use among all the libraries of the world. At the New York Public Library you will find scholarly attendants to help you find the book which you have in mind and to suggest a dozen other books to throw further light on the subject. Here a numbered table is assigned to you, the reader, and the books are brought with amazing celerity direct to your elbow.

To the library resources of New York was recently added the magnificent collection left by James Pierpont Morgan, together with notable additions made by his son, J. P. Morgan, Jr. The value of this collection is estimated at ten million dollars, including many manuscript treasures. Here one may see Dickens' "The Cricket on the Hearth," as it was written; with Thackeray's "The Rose and the Ring," Holmes' "Autocrat of the Breakfast Table," and a host of other manuscripts of equal interest. Here, too, are to be found many of the rarest early specimens of printing, and particularly early works in English.

The Hispanic Society of America and the American Geographical Society, both ornamenting Broadway at 156th street, furnish two outstanding collections in special fields. As far as rare Spanish and Spanish-American items are concerned one would seek them in New York in the fine library of the Hispanic Society. For early atlases and maps, and later ones, too, the American Geographical Society with one thousand atlases is second in America only to the Library of Congress.

The list of special collections in New York City and Brooklyn would run into the hundreds. Hebrew works printed before 1500 are found in the Jewish Theological Seminary in a collection not to be equaled elsewhere in the world. Textbooks of arithmetic and early schoolbooks in all subjects are found in an incomparable collection gathered by George A. Plimpton, the active head of Ginn and Company, and president of the Ginn Peace Foundation; The General Theological Seminary, Columbia University, with a million books and pamphlets; the Union Theological Seminary, and a dozen other institutions have libraries which contribute to make New York the center of literary America. Wealthy New Yorkers, of whom there are a few, have for years been distinguished as a group by the fact that among their number are many discriminating book collectors with amazing achievements in their hobbies.

The oldest library in the United States is the Harvard College Library. In 1638, two years after the founding of the College, "The Reverend Mr. John Harvard sometimes Minister of God's Word at Charlstown, by his last Will and Testament gave toward the erecting the abovsd School or Colledge, th' one Moiety or halfe parte of his Estate," with all of his books, totaling 370 in number. In 1667 the first librarian was appointed, Dr. Solomon Stoddard, an author and preacher. In 1655 Sir Kenelm Digby sent twenty-seven books, valued at £60, largely because of his friendly relations with Governor Winthrop, also a patron of the library.

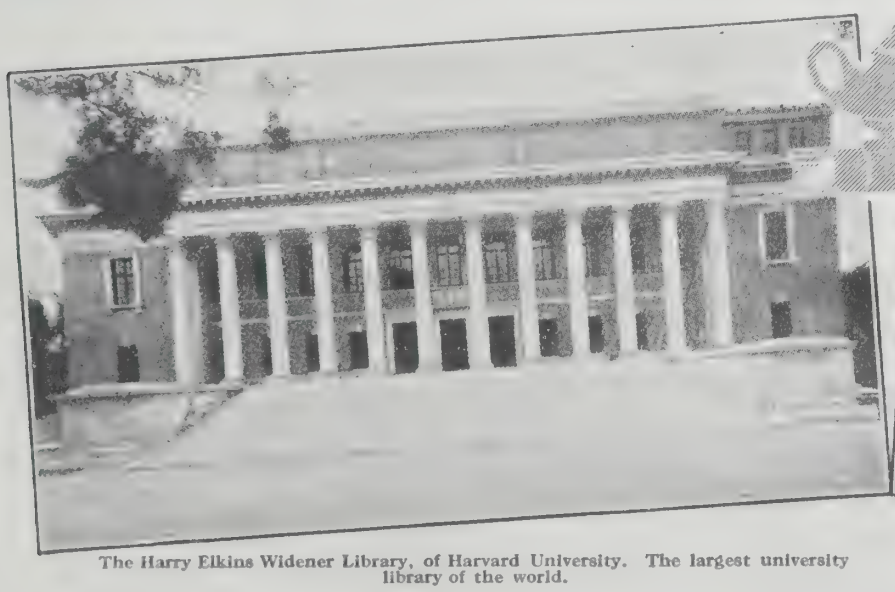
In 1764 the library, grown to include 5,000 volumes, was burned and only a few books were saved. Only one of John Harvard's original library is known, being John Downham's "Christian Warfare Against the Deuill World and Flesh."

The destruction of the Harvard Library awakened in the colonists a renewed sense of its importance. Thomas Hollis of Lincoln's Inn whose family had before then made many gifts to Harvard sent over forty-one cases of books between 1765 and 1770; Governor Francis Bernard gave more than 300 volumes, the Province of New Hampshire appropriated £300; various religious societies sent large donations and with more than two hundred other contributors united to make the library better than it was before the fire.

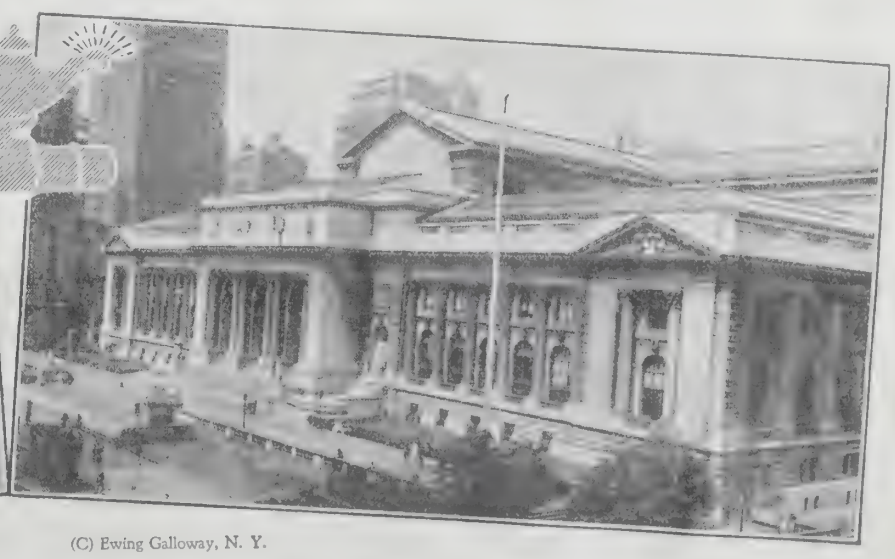
The Harvard College Library now possessing more than two million books and pamphlets is housed in the most modern building of the great American libraries. This building was completed in 1915, a memorial to Harry Elkins Widener, an ardent book lover and collector who perished in the *Titanic* disaster of 1912.

Harvard Library possesses probably a greater variety of fine special collections than any other library with the exception of the British Museum. Most of these are of a scholarly character like the botanical libraries of the Arnold Arboretum and the Gray Herbarium, Andover-Harvard Theological Library, the Ebeling American History Collection, The Widener Rare Books,

(*Concluded on page 15*)



The Harry Elkins Widener Library, of Harvard University. The largest university library of the world.



(C) Ewing Galloway, N. Y.

New York Public Library. The library which has the largest use of any library in the world.

What Is the Matter With Prohibition?

Is the Law Enforced? Is the Prohibition Personnel as It Should Be?

"Observer at Close Range" Seeks to Analyze the General Situation

By MONTFORT T. STOKES

LAW enforcement of the Eighteenth Amendment has fallen far short of complete success.

As there is a cause for every condition that exists, there are ample reasons why two national and many state administrations have made more or less of a failure of this formidable task.

Having had an opportunity for fifteen consecutive months to observe at close range the operations of one of the largest Federal enforcement offices in the country, the writer feels that he knows at least some of the most potent reasons for the failure.

In the state director's office there were approximately eighty employes on January 1, 1923, with a monthly pay roll of about $11,000. Attached to this office and under the control of the director were also eight "group heads" distributed at different points in the state, and at each point was located from five to twenty enforcement agents. To pay the salaries and expenses of this outside force of about seventy men, with their office assistants, including clerks and stenographers (agents drew the cost of their travel and maintenance when not at their post of duty, which was much of the time), required at least $18,000 more a month, or a total pay roll of about $325,000 on an annual basis.

Of these employes, totaling about one hundred and fifty, not more than 6 per cent were true friends of the law they were being paid by their country to uphold. For every nine standing squarely for strict law observance, there were one hundred and forty-one opposed to honest enforcement and at least half of these favoring the repeal of the Eighteenth Amendment. These astounding facts were obtained by actual personal interviews and daily contact with these persons.

Sixteen-to-One Against Law

THIS ratio prevailed among all the employes, men and women, including secretaries, clerks, filers, stenographers, typists and accountants—about a sixteen to one proportion as between the enemies and friends of the law. Not only that, but the very few of the latter were tremendously handicapped in their work, as they were ridiculed by the great majority and designated as "cranks." They were not as a rule trusted with important matters, and rarely ever assigned to a case where there was danger of the refusal of a permit. They were usually given applications where no doubt existed as to the regularity and reliability of the applicant.

Thus it is shown that of the annual salaries of $325,000 paid by the government into this one office for enforcement in a single year, $19,500 went to those honestly interested in upholding the law, while $205,500 went to those who were much better pleased when it was successfully defied and defeated.

During this same period, there was also stationed in the same state a divisional chief, in command of a force of from twenty to fifty general prohibition agents drawing higher salaries than the Federal agents, and constituted of a personnel not even as favorable in their regard for the law as those under the state director. This, because they generally came from other states and were not in the slightest degree controlled by local conditions.

The cost of this branch of the service in this state was at least $100,000 a year, with an annual total outlay of $425,000 by the Federal Government, with only 9 per cent of the total, or $25,500, going to the friends of the law, and 91 per cent, or $399,500, to its enemies; which surely discloses one very significant reason for farcical law observance.

Occupying the front offices and drawing the major salaries in the director's office were state director, assistant state director, Federal supervisor, legal advisor, state group head and chief permit inspector, drawing salaries respectively of $5,000, $4,000, $4,000, $3,600, $4,000, and $3,000 annually.

An Unfriendly Attitude

IT IS the Federal supervisor who is the special representative of the Washington office and whose duty it is to keep the National director in touch with what is doing. In this instance a very unobtrusive little man held this position. He did not care much whether the law was enforced or not, but was sorry it was ever enacted. He did not believe in prohibition but disliked argument, and was quite apt to agree with the opinions of the one talking to him—always wanted to travel the road of the least resistance. He has been in the internal revenue service for many years and remains, evidently because he is always willing to do things that will please his superiors.

He is supposed to be an expert on all office rules and existing Federal statutes pertaining to his department, but when he was asked two years after the Volstead Act went into effect "if the buyer as well as the seller of illegally sold liquor could be properly charged with the violation of this act," his reply was: "Well, now, that is a new question and I will have to look it up very carefully before I can answer." This in spite of the fact that every other employe in the office knew there was no provision in the law for the prosecution of the buyer. However, every true friend of the act believes there should have been. In fact, proposed amendments are now pending in Congress, which, if passed, will make the buyer equally guilty with the seller.

Perhaps the official in an enforcement office, possessed of the greatest opportunity to do good or evil, is the legal advisor. He presides at all hearings of complaints filed against alleged violators, and is presumed to be counsel for the government. Defendants are represented by their own attorneys. While the legal advisor does not make a final decision he files with his report in each case his recommendation as to how it should be disposed of, and in most cases his suggestion is approved.

In this office the legal advisor did not hesitate often to express his unfriendliness to the Eighteenth Amendment, and some of the most sincere and effective workers among the agents often complained of his manner and method at hearings, charging that he appeared to them much more friendly to the cause of the defendants than that of the government. This writer is satisfied that because of the prejudice of this official, rank injustice often resulted and many real criminals escaped.

Thousands of Permits

IT IS the chief permit inspector to whom go the original applications of those desiring to sell liquor, claiming a legal right to do so. It is his duty to assign to the various inspecting agents these applications for investigation and upon the receipt of their reports, made after interviewing the applicant and visiting his place of business, to make his recommendation as to whether the permit to sell should be granted.

In this case the holder of this job was an uncompromising friend and patron of the liquor traffic and often so expressed himself, when sitting at his desk, in most vigorous language, and many times with profane emphasis. Before his appointment, he was a small-town politician of the ward heeler type, with known intemperate habits. He boasted that he secured his appointment through the influence of a nearby city boss, who happened to be a distant relative. His name appeared with that of the assistant director in the agent's report of official irregularities and soon thereafter he was transferred to a far-away station, but was not at the time discharged—simply sent to a new field of operation.

With such an organization in control, aided by nearly one hundred assistants constantly at the command of their superior officers, of whom not more than 6 per cent were genuine and loyal supporters of the law, is it surprising that there were thousands of permits in the hands of bootleggers and other law violators, and that in a single city in one year there were nearly 45,000 arrests for drunkenness?

There are fundamental reasons for the existence of these conditions. Among the more important are: an inactive public sentiment—lack of co-operation of town, city, and state officials, particularly mayors, prosecutors, justices, police chiefs, policemen and constables; duplicity of side-stepping politicians, with appointive power and want of sympathy; and co-operation of those high in command, who are really responsible for enforcement; actual interference when, in spite of all handicaps, the few sincere agents make an effort to bring violators to justice; spineless backbones of many who should be and who pretend to be friends of the law, and who are responsible for all kinds of ridiculous and harmful actions, particularly in the making of appointments.

What of the Patrons?

BEFORE prohibition enforcement can be made effective without unnecessary hardship for the officers charged with this duty, the law should be strengthened in at least two particulars: Patrons of bootleggers and all others engaged in illicit liquor selling should be made equally guilty with the seller. This provision should apply without fear or favor to the ordinary citizen, officeholder, political boss, church leader, workman, business man, the poor and the rich.

The buyer goes about soliciting the services of the bootlegger, paying him to violate the laws of his country. But in the judgment of Congress as reflected in the Volstead Act, he who is primarily responsible for every violation is a good citizen and absolutely immune from prosecution.

In one year in the city of Philadelphia, the police made nearly 45,000 arrests for drunkenness and only nine arrests for bootlegging, although the place was swarming with all kinds of illicit liquor sellers. If the law provided for the prosecution of the buyers, each one of these thousands of "drunks" would have learned that there was mighty little profit in patronizing bootleggers. If they had been faithful to their oaths to defend and support the laws of their country, these city officials could have made use of each of the thousands arrested as direct sources of information regarding from whom the liquor was obtained and, instead of making nine arrests for illegal selling, could have increased the number by more than forty thousand.

Enforcement agents should not be required to make garbage buckets or poisonous-booze containers of their stomachs, successfully to secure evidence of violations. This is one of the burning injustices of the requirements in the government enforcement service.

Instead, the law should give the agent the authority to visit any place where he has reason to believe the law is being violated or against which a charge has been filed and sworn to by a reputable citizen, and demand from the person in charge a sample of any beverage being offered for sale, which he thinks may not conform to the provisions of the law. Any refusal to deliver this sample, upon payment being tendered, should be made punishable by fine or imprisonment, or both, according to the circumstances. Such an amendment would make the life of the agent more bearable and rid it of much of the embarrassment, humiliation and danger which is now encountered at almost every step.

No one who is not engaged in selling a law-forbidden beverage would object to furnishing a government representative with a sample of anything he is offering for sale, and the seller who is a law violator should be compelled to afford officers every opportunity of doing their duty without hindrance or interference.

Many agents, while trying to conceal their identity in whisky shops, have been suspected, and pounced upon and beaten up by the violators and the mobs usually hanging about such places. In a few instances non-drinking agents have got by for a time by using a small atomizer, sucking up the liquor from the glass while the barkeeper has his back turned making change. But sooner or later the seller unexpectedly turns round and makes the discovery. Then there is trouble, often a cleaning out, and sometimes bloodshed.

Many sober, clean, and honorable young people have refrained from making application for employment in the Prohibition Enforcement department of the Federal service, because of the requirement to test the liquor by drinking it in the effort to secure evidence of violations. When they have drunk the liquor and know what it is, they are often required to produce a liberal sample for the chemist to test.

As to Selecting Officials

IT IS a disgrace for this great country to put any young man or woman in the way of becoming an inebriate to assist in enforcing a great moral reform, already a part of the laws and constitution of the land. Common sense and justice should have some place in compelling law observance.

With the law strengthened in the interest of efficiency, comfort and safety of the state and Federal enforcement officers and at the same time depriving violators of some of the special privileges they now enjoy, every good citizen would be amazed and delighted with the difference in results. Then if there should come from some "higher up" official with the necessary authority, a positive order to those having the selection and appointment of all enforcement officials, high and low, that no one should be given a place in the department, not at heart in sympathy with its duties, not a genuine friend of all laws and not an ardent supporter of the Nation's constitution. This should include all employes from the least responsible clerk and stenographer to the executive and legal department heads. Not even excepting United States judges, who must preside at the trials of the violators.

More than a year ago an eastern attorney was made a United States Judge. He had been so active in his opposition to the Eighteenth Amendment and the Volstead Act that he was an officer in one of the many organizations formed and maintained to do all possible to discourage law observance and encourage defiers of the law. The United States Senators, from the state in which he lived, urged his appointment, arguing that he was a well-read lawyer and that they believed him honest and big enough to rise above his personal whims and prejudices in making decisions from the Federal bench. The appointment was made and this man had served as judge but a few months when the opportunity came to him, and he embraced it, so to construe a technical provision of the law that his holding proved a great damage to the prosecution and of much advantage to the defense in an important liquor law violation case.

Facing Both Ways

ON THE bench he was the same man as when he was fighting the law as a citizen. Then the many thousands, who protested against his appointment to the then attorney-general and others having to do with the appointing of United States Judges, were heard to exclaim, "We told you so." One of the Senators insisting on this appointment is often quite loud and enthusiastic in making declarations in favor of strict law enforcement. Yet he very often endorses persons for the service known to be openly hostile to the law.

What is the just judgment on the merits of one so powerful in this government as a United States Senator, who with his left hand swears that he loves the law and will do everything to protect it and then with his right hand uses all the influence and power he possesses to name as its guardians and protectors those who are its sworn enemies and have been openly engaged in doing everything they could to cripple, ridicule and defeat it? This is certainly a shoddy sample of consistency—even for a member of the foremost law-making body of the world.

The concluding section of this article will appear next week.

Did Washington Rival Munchausen?

About That Tale of a Mosquito Which Bit Through the General's Boot

By ROY H. FRICKEN

GEORGE WASHINGTON: first in war, first in peace, first in the hearts of his countrymen—And first American nature faker!

Could George tell a lie? It very much appears that he could, despite that pious old fraud, the Reverend Mason Locke Weems, who first set into circulation the story of the cherry tree and little George's hatchet, without which no series of school readers is quite complete.

After these many years, when everyone has been taught to believe that Washington was just a little short of being human, because of this alleged inability to deviate from the rigid and exact truth, it is indeed encouraging to learn that he was not above venturing into the provinces and domains of that delightful old spoofer—the Baron Munchausen. Not only did he perpetrate a plausible bit of fakery, but it appears to have been told with the solemn gravity essential to complete belief.

Washington's falsehood is found in the account of the travels of the now little-known but once widely read Isaac Weld, Junior, a British traveler who visited the United States in 1795. Weld published a series of letters detailing his experience in the states during his three years' travel, and he describes a number of meetings with the First President.

Weld, traveling on horseback, by stage or on foot, had arrived at the village of Skenesborough, New York, then a little clearing at the end of Lake Champlain, with a population of about fifty persons. He writes as follows of his experiences in the village:

"Skenesborough is most dreadfully infested with mosquitoes; so many of them attacked us the first night of our sleeping there, that when we arose in the morning our faces and hands were covered all over with large pustules, precisely like those of a person in the smallpox. This happened, too, notwithstanding that the people of the house, before we went to bed, had taken all the pains possible to clear the room of them, by fumigating it with the smoke of green wood, and afterward securing the windows with gauze blinds; and even on the second night, although we destroyed many dozens of them on the walls, after a similar fumigation had been made, yet we suffered nearly as much.

"These insects were of a much larger size than any I ever saw elsewhere, and their bite was uncommonly venomous. General Washington told me, that he never was so much annoyed by mosquitoes in any part of America as in Skenesborough, for that they used to bite through the thickest boot."

Fifty years later an American author, Miss Eliza Leslie, in a book on manners, criticized Washington for misleading the English traveler.

"English strangers complain (and with reason)," she writes, "of the American practice of imposing on their credulity, by giving them false and exaggerated accounts of certain things peculiar to this country, and telling them, as truths, stories that are absolute impossibilities; the amusement being to see how the John Bulls swallow these absurdities. Even General Washington diverted himself by mystifying Weld the English traveler, who complained to him at Mount Vernon of mosquitoes so large and fierce that they bit through his cloth coat."

"Those are nothing," said Washington, "to mosquitoes I have met with, that bite through a thick leather boot." Weld expressed his astonishment (as well he might), and, when he "put out a book" inserted the story of the boot-piercing insects, which he said must be true, as he had it from no less a person than General Washington.

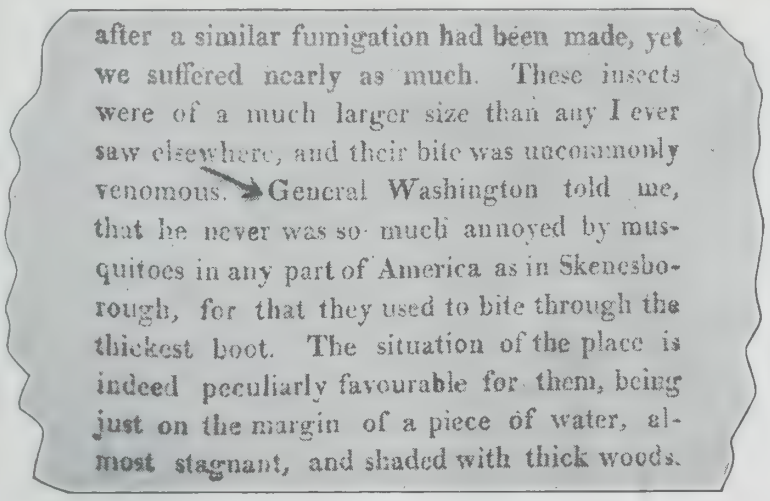
"It is a work of supererogation to furnish falsehoods for British travelers," Miss Leslie informed her readers. "They can manufacture them fast enough. Also, it is ungenerous thus to sport with their ignorance, and betray them into ridiculous caricatures, which they present to the English world in good faith."

It is interesting to note that George Washington, now universally revered and respected, was once the subject of the most bitter enmity from his own countrymen. Even on such an occasion as his birthday, which was celebrated throughout the entire country while he was yet living, there were Americans who refused to drink the President's health after dinner.

"Not one town of any importance was there in the whole Union," Weld writes, "where some meetings did not take place in honor of this day: yet singular as it may appear, there are people in this country, Americans, too, foremost in boasting to other nations of that constitution which has been raised for them by his valor and wisdom who are either so insensible to his merit, or so totally devoid of every generous sentiment, that they can refuse to join in commendations of those talents to which they are so much indebted: indeed to such an extent has this perverse spirit been carried that I have myself seen numbers of men, in all other points men of respectability, that have peremptorily refused even to pay him the small compliment of drinking to his health after dinner.

"It is true, indeed, that they qualify their conduct partly by asserting that it is only as President of the United States, and not as General Washington, that they have a dislike to him: but this is only a mean subterfuge which they are forced to have recourse to, lest their conduct should appear too strongly marked with ingratitude.

"During the war there were many, and not loyalists, either, who were doing all in their power to remove him from that command whereby he so eminently distinguished himself. It is the spirit of dissatisfaction which forms a leading trait in the character of the Americans as a people which produces this malevolence at present, just as it did formerly; and if their public affairs were regulated by a person sent from heaven I firmly believe his acts, instead of meeting with universal approbation, would by many be considered as deceitful and flagitious."



after a similar fumigation had been made, yet we suffered nearly as much. These insects were of a much larger size than any I ever saw elsewhere, and their bite was uncommonly venomous. General Washington told me, that he never was so much annoyed by musquitoes in any part of America as in Skenesborough, for that they used to bite through the thickest boot. The situation of the place is indeed peculiarly favourable for them, being just on the margin of a piece of water, almost stagnant, and shaded with thick woods.

AND GEORGE NEVER TOLD A LIE!

Entomologists are agreed that George Washington, famed for his cherry-tree exploit, stepped over the line of strict truth and veracity when he told Isaac Weld, Junior, a well-known British traveler, that he had seen mosquitoes that bit right through his boots. The photograph is a facsimile of the page on which Weld perpetuated this Munchausian tale of the first President, from his volume, "Travels Through the States of North America," published in 1797.

Washington made a festive affair of his own birthday, Weld records, and the city of Philadelphia, then the capital of the United States, was gay with the excitement of the sessions of Congress, the state assembly and the Supreme Federal Court.

"On General Washington's birthday, which was a few days ago," Weld writes, "this city was unusually gay: every person of consequence in it, Quakers alone excepted, made it a point to visit the general on this day. As early as 11 o'clock in the morning he was prepared to receive them, and the audience lasted until 3 in the afternoon. The Society of the Cincinnati (an organization of American officers who had served in the revolutionary war), the clergy, the officers of the militia and several others, who formed a distinct body of citizens, came by themselves separately. The foreign ministers attended in their richest dresses and most splendid equipages. Two large parlors were open for the reception of the gentlemen, the windows of one of which toward the street were crowded with spectators on the outside.

"The sideboard was furnished with cake and wines, whereof the visitors partook. I never observed so much cheerfulness before in the countenance of General Washington; but it was impossible for him to remain insensible to the attention and the compliments paid to him on this occasion.

"The ladies of the city, equally attentive, paid their respects to Mrs. Washington, who received them in the drawing room upstairs. After having waited on the general, most of the gentlemen also visited her. A public ball and supper terminated the rejoicings of the day.

"On this day General Washington terminated his sixty-fourth year; but though not an unhealthy man, he seemed considerably older. The innumerable vexations he has met with in his different public capacities, have very sensibly impaired the vigor of his constitution, and given him an aged appearance. There is a very material difference, however, in his looks when seen in private, and when he appears in public full dressed; in the latter case the hand of art makes up for the ravages of time, and he seems many years younger.

"Few persons find themselves for the first time in the presence of General Washington, a man so renowned in the present day for his wisdom and moderation, and whose name will be transmitted with such honor to posterity, without being impressed with a certain degree of veneration and awe; nor do these emotions subside on a closer acquaintance; on the contrary, his person and department are such as rather tend to augment them. There is something very austere in his countenance, and in his manners he is uncommonly reserved. I have heard some officers, that served immediately under his command during the American war, say that they never saw him smile during all the time that they were with him.

"No man has ever yet been connected with him by the reciprocal and unconstrained ties of friendship; and but few can boast even of having been on an easy and familiar footing with him.

"Mr. Stuart, the eminent portrait painter (whose portraits of both Mr. and Mrs. Washington are the best known) told me that there are features in his face totally different from what he ever observed in that of any other human being; the sockets of the eyes, for instance, are larger than what he ever met with before, and the upper part of the nose broader.

"All his features, he observed, were indicative of the strongest and most ungovernable passions, and had he been born in the forests, it was his opinion that he would have been the fiercest man among the savage tribes. In this Mr. Stuart has given proof of his great discernment and intimate knowledge of the human countenance; for although General Washington has been extolled for his great moderation and calmness during the very trying situations in which he has so often been placed, yet those who have been acquainted with him the longest and most intimately say that he is by nature a man of a fierce and irritable disposition, but that, like Socrates, his judgment and great self-command have always made him appear a man of a different cast in the eyes of the world.

"He speaks with great diffidence, and sometimes hesitates for a word; but it is always to find one particularly well adapted to his meaning. His language is manly and expressive. At levee his discourse with strangers turns principally upon the subject of America; and if they have been through any remarkable places his conversation is free and particularly interesting, as he is intimately acquainted with every part of the country. He is much more open and free in his behavior at levee than in private, and in the company of ladies still more so than when solely with men.

"General Washington's self-moderation is well known to the world already. It is a remarkable circumstance, which redounds to his eternal honor, that while president of the United States he never appointed one of his own relations to any office of trust or emolument, although he has several that are men of abilities, and well qualified to fill the most important stations in the government."

Madrid and Blasco Ibanez

MADRID—After weeks of campaigning, pamphleteering, threatening, prophesying and denouncing, Blasco Ibañez, the world-renowned author of "The Four Horsemen of the Apocalypse," is still safe and well in Paris, and King Alphonso of Spain, the object of these denunciations, is safe and well in Madrid. The French and the English are unmoved. The promised revolution, or even the overthrow of Primo de Rivera and his Directorate of generals, has not taken place. "The sequestrated Nation" is still more or less sequestrated. "Alphonso the thirteenth unmasked" remains unmasked, and no one in Spain cares a hoot.

The military Directorate was disturbed at the beginning of Blasco Ibañez's campaign. Admiral Magaz, who is in charge of affairs now General de Rivera is in command in Morocco, felt obliged to call the editors of the monarchist papers together and to beg them to defend the King at all costs. "We will slacken the censorship and let you attack the Directorate, but you must defend the King," the Admiral said. Next morning all the articles attacking the Directorate were blue-penciled, so no defenses of the King appeared. Ultimately two of the papers of the extreme Right began a campaign which noticeably was less a defense of the King than an attack on Blasco Ibañez. One or two authors of the lowest literary and of doubtful personal reputation poured forth their wrath on the head of Ibañez. But monarchists came on lamenting the type of defenders with which the King's cause had been saddled. Various public meetings were organized but as they were attended only by his fiercest supporters, no converts were made nor were any waverers roped in. Blasco Ibañez's films have had to be withdrawn in Madrid. His summons by a military judge in Valencia for *lèse-majesté* and on other charges was meaningless, since he is safely over the border, and the summons, a merely patriotic fiction, has been withdrawn at the King's request. His pamphlets have entered Spain in the smallest numbers. Some have been dropped by airplane in Burgos. Anyone found in possession of one of these pamphlets is liable to imprisonment.

The result of this campaign, as of all campaigns in Spain, is nothing. The attackers and counter-attackers have brought off a splendid haul of self-advertisement, with Blasco Ibañez at their head. The whole affair has now degenerated into a vulgar controversy. The King, who has preserved an apparent calm, has just broken silence. He says, "I wish Blasco Ibañez would stop his campaign against me and write some interesting novels which we could all enjoy and praise."

Madrid has taken the whole business very philosophically. Blasco has never attained in Spain to the wild reputation he has in the United States, South America, and England. "The Four Horsemen of the Apocalypse" is believed here to be one of his worst books. He is looked upon as one of those fantastic creatures of the Mediterranean coast—an extraordinary mixture of Don Juan Tenorio, Don Quixote, Sancho Panza and the wild picaros, a creature whom no one can take seriously. Republicans, Socialists, all the people of the Left, who agree with every word he has to say about the King and the Military Directorate, have been laughing at Blasco Ibañez's latest adventure. He has merely said in his pamphlets things which are everyday gossip in Madrid. He has added nothing to the information of the enemies of the King and of the Military Directorate, and has certainly not given these enemies a new weapon. The whole affair has been a great bubble. It has now burst.

French Aristocracy Today

By PHILIP CARR

EVER since the Third Republic came into existence, the French nobility has sulked in its tents and refused to have anything to do with the government. It has consented to hold commissions in the army and the navy—more especially the navy—and, as regards the army, more especially the cavalry. It has even condescended to enter the diplomatic service. Only in recent years, however, have a few of its more adventurous younger members made up their minds to present themselves for election to a Republican Chamber of Deputies or Senate, and then with a rather vague and quite harmless hope of eventually getting rid of the Republic altogether. For the nobility, France has meant the fighting services, the Quai D'Orsay—up to a point—and, of course, the church, which has always been at more or less open war with the secular republican state. For them, France has never meant the existing government of the country.

When I say that the nobility has sulked in its tents, I mean that it has retired rather to its country chateaux, and to the ancestral hotels, or family mansions, which are to be found surrounding quiet courtyards, with large and heavily closed carriage entrances of carved wood in most of the older streets of Paris, but especially in the Ile de St. Louis and the Rue de l'Universite. The ancient and princely houses in the latter street no doubt accounted for the name of Faubourg St. Germain being given to the whole of this retired and exclusive aristocratic society, which is not really localized in any quarter of Paris, and has acquired the character which now goes with the name long after the neighborhood of St. Germain des Prés has ceased to be a faubourg or suburb. It belongs quite appropriately, however, to that district on the south side of the river, rich in ecclesiastical and learned associations, through which the long Boulevard St. Germain runs.

Chateau at Chenonceaux with moat and gardens.

The aristocracy certainly still possesses some very comfortable tents to sulk in, both in Paris and the provinces; for the Revolution, though it abolished all noble titles, destroyed and confiscated far fewer noble houses than is generally supposed, and many, even of those which were confiscated, were recovered by their traditional owners under one or other of the succeeding régimes. The variety of these régimes in the last hundred and fifty years accounts for the extraordinary mixture of the titles of different vintages, which exist side by side today, with no officially or even generally recognized handy reference Burke to tell the sedulous snob whether they are valid or not. The Republic has never conferred any titles, but all the other governments, from that of the great Napoleon onward, sprinkled them freely. Napoleon very nearly succeeded in turning the whole thing to the ridiculous by making washerwomen into duchesses and sergeant-majors into hereditary princes.

After him, on each of the three occasions on which France was fitted out with a monarchical government, the event was celebrated by a goodly crop of titles, and Napoleon III gallantly followed the tradition by creating a dozen dukes and forty counts, viscounts and barons. Add to all of these the titles which French subjects have acquired from the Papacy on business terms, whose open frankness cannot be too highly commended, and it will be seen that the waiter who wants to be sure whether he ought to call his customer *"Monsieur le Comte"* has a difficult task of discrimination.

It need hardly be said that the several vintages do not recognize one another. The *ancienne noblesse,* which existed before 1789, thinks nothing of the *nouvelle noblesse,* whose mushroom growth dates from the Empire or later. The *noblessé titrée,* or possessors of a title which has descended to the head of the family, is far above the *simple noblesse,* who are given by custom what in England would merely be called courtesy titles, but are given them much more freely. For instance, supposing the eldest brother to be the Comte Durand —if a name as vulgar as Smith could be imagined ever to be that of a comte at all—his younger brothers would be called Comte Robert Durand. Comte Gilbert Durand, and so on. Moreover, the elder brother can apparently transfer his hereditary title to his junior if he happens to have acquired a better one. Thus I knew a man who was a baron by right, but had bought the Papal title of comte, and consequently passed on the baron to his *frère* cadet. The courtesy titles seem, moreover, to follow no rule. For instance, in England the eldest son of a duke would carry no higher rank than marquis, but the eldest son of the Duc d'Uzès is Duc de Crussol.

As for the *"particules,"* or persons who have been given the right to put "de" before their family names, I will not seek to discuss them, for their name, besides having "de" before it, is also legion. Napoleon III conferred the right on 368 families, whose members are by now presumably fairly numerous; but they are as nothing to the men whose "de" has mysteriously grown on to them in a night and has suddenly appeared on their visiting cards.

At the time of the French Revolution, a large number of the aristocracy found refuge in England, and during the Reign of Terror lived in absolute security separated from the scene of their troubles by the waters of the channel. A large proportion of these did not return to France at the restoration of the monarchy, but remained in the land of their adoption, dropping their titles, which were now really useless, and becoming English citizens in every sense.

A number of them also emigrated to the newly formed republic of the United States of America, where they found a ready welcome from the country which the Marquis Lafayette had helped in its great struggle for freedom, while others again joined their fellow countrymen in Canada, or New France, as it was formerly called.

Some of these refugees were of the best blood that France could produce, and a large proportion of the counts and countesses, and other titled persons who are now so much perturbed by the new laws being framed in their country, are unable to trace their ancestry nearly so far back as those refugees of the Revolution.

After all, the time does not seem to be far distant when titles will become a thing of the past over the whole of Europe. Men are being more and more assessed by their real value these days, and not by the numberings of quarterings on their escutcheons.

I have said that the republic grants no titles. Its only way of satisfying the greedy is to nominate them to the Legion of Honor; but although I have heard of the wives of British officers who, on learning that their husbands had received the complimentary appointment of Chevalier—the lowest grade in the Napoleonic Order—wondered whether they had acquired the right to call themselves "Lady," the Legion of Honor adds no title to the name, and its only outward expression is the red ribbon or more important rosette always worn in the buttonhole and giving the wearer the right to have a larger gratuity expected of him from railway porters.

The republic has never granted any titles, but it has hitherto recognized and even registered—for a small fee added to the revenue—those who considered that such a registration gave an added security to their nobility. An office of the Ministry of Justice, called the Bureau du Sceau, has for some time been in existence for the purpose. What will make the noblesse of all kinds sulk more than ever is that the republic has decided to refuse even this limited recognition and to abolish the registration altogether.

If a bill which has just been introduced by the minister of justice passes through Parliament—and there is no reason why it should not—public officials will be definitely forbidden, under pain of punishment, to mention any title in a public document. In future, therefore, when a Duc marries a plebeian damsel from Chicago, however much the lady will become a Duchess by the religious ceremony, the proceedings before the Maire, which alone make the marriage legal, will record merely that she is the wife of a simple Monsieur, and that she herself is no more than a Madame.

One would think that the Herriot Government would be tottering to its fall. But it is not.

The great tower, Amboise.

Turning Points in the Life of a Great American

Benjamin Franklin

By FRANK DORRANCE HOPLEY

BENJAMIN FRANKLIN often told the story of a call which he made, when a young lad, on Cotton Mather. Franklin was tall and lanky for his age. As he left the house he hit his head against a beam. "Stoop," said Mather. "You are young and have the world before you. Stoop as you go through it, and you will miss many hard thumps."

Franklin never forgot this advice, and all through his life profited by obeying the injunction of his friend.

Emma L. Dana, in her book "Makers of America," tells how Franklin came on the first turning point in his life, and became a printer:

"After two years of schooling, Benjamin went to work, at the age of 10, in his father's shop. Mr. Franklin was a soap boiler and a candle maker, so the small boy spent his time cutting wicks and filling molds for candles, tending shop and running errands. He hated this work and longed to go to sea. Swimming and pottering about boats, all his spare moments were spent near the water.

"At last, his father, fearing that Benjamin would run away to sea, as an older brother had done, took him to see men of different trades at their work, hoping to arouse in the boy an interest in something that would keep him on land.

"Always Franklin had a passion for books. He says in the story he wrote of his own life: 'I cannot remember when I could not read.' Because of this love for books, his father finally put Benjamin, when he was 12 years old, to work with his brother James, who was a printer."

When He Got a Silver Spoon

FROM the first day the boy delighted in the art of printing and soon became proficient in it.

Franklin's brother, however, was harsh to the boy and it was not long before he left his employ and went to Philadelphia. There, after several years of work for others, he established his own printing office.

At the age of 24 another turning point came in the life of Franklin, and that was his marriage to Deborah Read, which he always asserted was the one great factor in his future success.

Speaking of his marriage, Franklin said:

"We have an English proverb, 'He that would thrive must ask his wife.' It was lucky for me that I had one as much disposed to industry and frugality as myself. She assisted me cheerfully in my business, folding and stitching pamphlets, tending shop, purchasing old linen rags for the paper makers . . . . My breakfast was for a long time bread and milk, no tea, and I ate it out of a two-penny porringer with a pewter spoon. But mark how luxury will enter families, and make a progress, in spite of principle: Being called one morning to breakfast, I found it in a china bowl with a spoon of silver. They had been bought for me without my knowledge by my wife, for which she had no other excuse or apology to make but that she thought her husband deserved a silver spoon and a china bowl, as well as any of his neighbors."

Another hour when the road turned for Benjamin Franklin was when he was persuaded to go into politics. "The public," he writes, "now considering me as a man of leisure, laid hold of me for their purposes."

He was elected to the Pennsylvania assembly in 1752, and was made postmaster-general of all the colonies. By his genius he completely changed the whole system of the post office department, and gave a better postal system than had ever been known before.

What Joshua Did

FROM that time, down through the stormy days of the revolution, Franklin faithfully served his country, in varied capacities, and was chosen envoy to France to ask aid for his struggling countrymen. Miss Dana tells of his reception there:

"Paris went wild over him. The greatest writers, philosophers and scientists of France—men of all classes welcomed him as no foreigner had ever been welcomed before. People crowded the street to see him pass. His portly figure, his heavy walking stick, his head without a wig, such as French gentlemen wore, but covered with a heavy cap of marten fur; his shrewd eyes twinkling through his great horn spectacles, his spotless linen, his simple brown suit of colonial make, all marked him as Franklin, the American. People of fashion began to copy his dress. They hung his picture over their fireplaces."

Franklin's ready wit always stood him in good stead, and helped him to win many friends. At the close of the war, Franklin, the English ambassador and the French minister, were dining together at Versailles, and a toast from each was called for. The British minister began with:

"George the Third, who, like the sun in its meridian, spreads a luster throughout, and enlightens the world."

The French minister followed with:

"The illustrious Louis XVI, who, like the moon, sheds his mild and benignant rays on, and influences the globe."

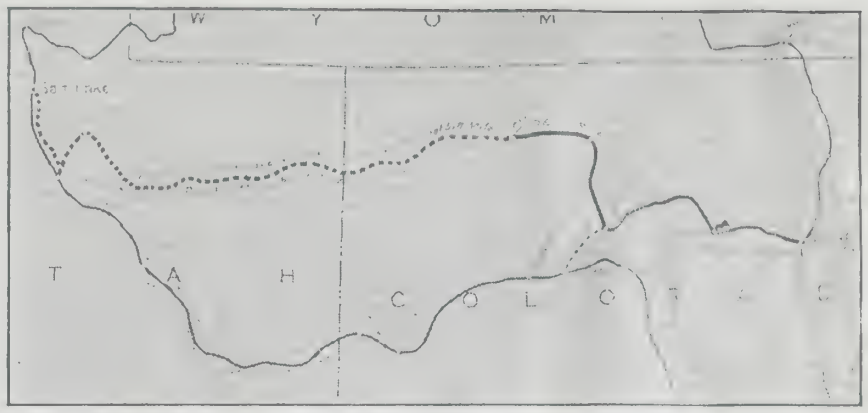
Franklin slowly rose, and lifted high his glass.

"To George Washington," he said, "commander of the American armies; who, like Joshua of old, commanded the sun and the moon to stand still, and they obeyed him."

The Moffat Tunnel

Boring Through Mountains; World's Longest Short Cut

By E. L. M'COLGIN



Map showing existing railroad routes between Denver and Salt Lake City, with comparative mileages, when the Dotsero cut-off and the Denver and Salt Lake extension shall have been completed.

THE city of Denver and several associated counties in Colorado are boring what will be the longest railroad tunnel in America through the Continental Divide a few miles west of the city. This huge project, the so-called Moffat Tunnel, will be a twin railroad and water bore 6.1 miles long under James Peak. It will be 9,000 feet above sea level and replace the present crossing of Rollins Pass at an altitude of 11,660 feet.

As a public undertaking the Moffat Tunnel can best be compared with the Hoosac Tunnel under the Berkshires, built by the Commonwealth of Massachusetts, and the railroad between Cincinnati and Chattanooga, built and owned by the city of Cincinnati and leased to the Southern Railway. They all represent efforts of communities to open up new trade routes.

The Moffat Tunnel, which is more than one-third completed, will enable the people of Denver, the largest city between the Missouri River and the Pacific Coast, to realize their long deferred ambition to be on a short, direct railroad route across the United States.

The Denver & Salt Lake Railroad, upon whose line the tunnel is being built, will, through its use, be able to eliminate 23 miles of curving tracks with a 4 per cent grade over Rollins Pass. The improved line will permit heavy freight and passenger trains to use the road and justify the construction of a "cut-off" or connecting link with the Denver & Rio Grande Western at Dotsero, Colorado. The joined railroads will create a new transcontinental route.

This new 572-mile route between Denver and Salt Lake City will be 173 miles shorter than the present Denver & Rio Grande Western line via Pueblo, and it will also be about fifty miles shorter than the Union Pacific route between Denver and Salt Lake City.

Especially significant is the fact that the new route west of Denver will provide the Burlington and Rock Island railroads with a connection that will give them through routes between Chicago and Kansas City comparable to the present Chicago & Northwestern-Union Pacific short line via Omaha and Cheyenne, which passes more than one hundred miles north of Denver.

Professor E. Z. Ripley, in his famous report to the Interstate Commerce Commission upon the proposed consolidation of the railroads, mentioned the necessity in the public interest of "a more evenly matched rivalry" as a check against "the dominant key line, the Union Pacific."

A unique feature of the operation of the Moffat Tunnel will be the conveyance through it of automobiles upon ferry trains of flat cars. The highways between Eastern and Western Colorado cross passes over the Continental Divide that are closed by storms and snows during about six months of the year.

Loop, where Denver and Salt Lake Railroad four per cent starts, in foreground. Circle—16 feet by 24 feet railroad tunnel, right; roundhouse for electric locomotives, center; water tunnel snowshed, left.

The 8 feet by 8 feet water tunnel which parallels the 16 feet by 24 feet railroad tunnel will divert the waters of the Fraser River, which flows down the western slope of the divide, to the east side of the mountains. These waters will supply irrigation and municipal needs in Denver and the surrounding country embraced within a fifty-mile distance from the east portal of the tunnel to Denver.

About fifteen miles west of Denver the crest of the Rocky Mountains with many peaks more than 14,000 feet in height and passes averaging ten thousand feet are encountered. As the Medicine Bow Range it extends north, unbroken for more than one hundred miles. Southward, as the Rampart Range it is a solid wall for the same distance.

The Union Pacific, the first transcontinental railroad, wanted to build its main line westward through Denver, but could not find a feasible and economical crossing of the mountains there. The line was built through Cheyenne and Laramie, Wyoming, because it could be finished in time to win the land grants offered by Congress. No tunneling of the main ranges of the Rockies was necessary upon the Wyoming location.

The Denver & Rio Grande Western Railway between Denver and Salt Lake City has to proceed 119 miles south to Pueblo before it can start through the mountains. It then threads the tortuous Royal Gorge of the Arkansas River and climbs over the 3.3 per cent grade of the Tennessee Pass near Leadville and is again as far north as Denver before the westward trend can be resumed. It is 745 miles from Denver to Salt Lake City, and 343 miles from Denver to Dotsero via this route.

West of the tunnel a 42-mile line will be built along the Colorado with but one-half per cent grades, joining the Denver & Salt Lake and the Denver & Rio Grande Western roads together at Dotsero. It will reduce the 745-mile line between Denver and Salt Lake City to 572 miles by cutting the distance between Denver and Dotsero to 170 miles, a saving of 173 miles. The circuitous Pueblo route will be circumvented. The steepest grade on all of the new routes will be but 2 per cent.

Professor Ripley in his consolidation report has described the Pueblo gateway of the Rio Grande road as "physically impossible for the stem of a great national railroad."

The completion of the Moffat Tunnel and the transformation of the Denver & Salt Lake Railroad into the keystone of a new transcontinental rail route will realize the dreams of David H. Moffat, one of the outstanding figures in the upbuilding of Colorado.

For a generation or more Mr. Moffat was the controlling power in Denver's business and financial existence as the president of the First National Bank. However, it was as a railroad builder and mining operator that Mr. Moffat first obtained prominence. Coming to Denver from upstate New York he obtained a foothold by selling Eastern papers, brought by the Pony Express, at 25 cents each. Later he entered banking, he had been a bank clerk in the East, and also became the owner of about one hundred silver mines.

Moffat employed his capital by participating in the building of the first railroad to enter Denver, and also the Colorado & Southern, and other lines. He was president of the Denver & Rio Grande for eight years and broad-gauged its narrow-gauge line through the Royal Gorge.

The last ten years of Moffat's enterprising life of 72 years were devoted to planning and building the Denver & Salt Lake Railroad, which like the new tunnel has always been known by his name. He gave his fortune to further Denver's efforts to obtain a short line to the Pacific Coast. David Moffat would doubtless have become a national figure had he settled in New York or Chicago.

Work upon the new road began in 1902, but it was nine years later before it reached Steamboat Springs, 214 miles from Denver. Moffat's resources became exhausted. Colonel D. C. Dodge, a famous Colorado pioneer, then contributed his fortune and enlisted other Denver capital in what was regarded as a civic enterprise. Mr. Moffat died in harness in 1911. Later the road was extended to Craig, 40 miles from Steamboat Springs.

The Denver & Salt Lake Railroad was built to a maximum grade of 2 per cent, the equal of any other railroad crossing the Rocky Mountains, except for 27.63 miles of what was termed the "temporary line" over Rollins Pass, 11,660 feet above sea level. Seventy-eight per cent of this section is composed of curves, and 31 per cent of it is on curves of 16 degrees or more. This segment has 4 per cent grades. It will be entirely eliminated by the tunnel.

A locomotive pulling uphill encounters a resistance of 20 pounds a ton of load for each per cent of grade, and sharp curves also impede the train. It requires four big Mallet engines to haul 22 freight cars "over the hill," as the summit of Rollins Pass at Corona is termed.

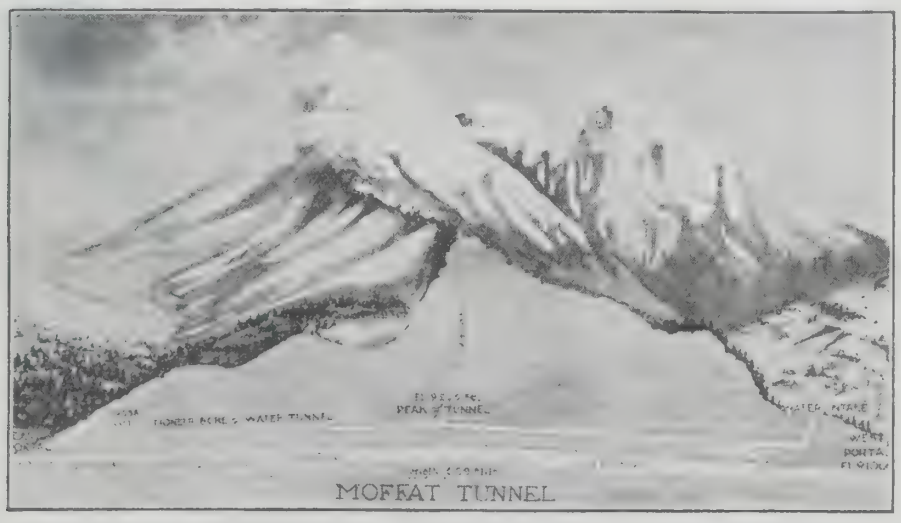
The Moffat Tunnel will replace the entire line over the pass and effect a reduction of 23 miles of track by converting the existing maze of curves and loops into the 6.1 mile tangent (straight line). An ordinary consolidation locomotive can then haul a 22-car train between the terminals of the old Rollins Pass line in half the time four larger engines now require. Long, heavy passenger trains, now impossible, can then pass swiftly over the Denver & Salt Lake road.

Forty-one per cent of the operating expense of the "Moffat Road" has gone in fighting snow, most of it at the pass. During the winter the road is often tied up completely for thirty or sixty days. Even when it is open in winter the cold and winds at the top of the exposed pass make it impossible to ship livestock and perishable merchandise to and from Denver.

The new tunnel, whose portals will be below the timber line, will avoid the snow handicap of the present high mountain crossing. Incidentally, most of the passes over the Continental Divide are not narr[illegible] between towering walls. They are usually [illegible] saddles between the higher range that can be more or less easily reached from the lower country.

In addition to carrying rail and water lines and furnishing a ferry train service for motor cars, the Moffat Tunnel will perform other public services. Telephone, telegraph, and electric power cables will be laid through the tunnel. It is difficult and expensive to maintain pole lines over the mountain passes where the winters are long and the frequent storms furious.

(Concluded on page 15)



Drawing illustrating engineering features of the tunnel by means of a cross section of the Continental Divide. Elevation of Rollins Pass where the road crosses is 11,660 feet.

Nordic Race, Its Quality and Place

Distinguished by Creative Energy, Love of Freedom and Common Sense

THE purest Nordics are to be found in Sweden; next to the Swedes in racial purity come the Norwegians, Danes, Dutch, and English. Elsewhere the Nordics are an aristocratic type, differing markedly from the masses, especially in the towns. Has the Nordic race the superiority which has been claimed for it? And are racial differences, apart from nationality, a very important factor in European history? Race and nationality are quite different things. The only definition of a nation is a large group of people who wish to belong together. The French, for example, are intensely national, but racially they belong to three different stocks.

Mr. Lothrop Stoddard, who is well known as a prophet of racialism in the interpretation of history, has lately put his theory to the test by visiting almost every country in Europe, and has given his experience to the world in a brilliant and extremely interesting book called "Racial Realities in Europe." It is, of course, a defense of a particular theory, which may be only one of several keys for unlocking the mysteries of national life; but I cannot doubt that the author has opened a very fruitful line of study, and that the philosophy of history will in the future have to pay more attention to the factor of race than it has done hitherto.

The main facts of race distribution are well known, and there is no longer any serious difference of opinion among experts. Europe contains two long-headed races, the Nordics and the Mediterraneans, and one round-headed race, the Alpines. The Nordic is tall and fair; the Mediterranean shorter and more slenderly built; his hair and eyes are dark, his skin olive, or swarthy. The Alpine is broad and sturdy, clumsily made, and usually dark. The Swedes, Spaniards, and Russians supply typical examples of these three types; though we must not select an aristocratic Russian, who may be a pure Nordic, nor the Mongolized type, which is very common, as an impolite proverb about scratching a Russian and finding a Tartar indicates.

Differences of mind and temperament are as well marked as variations in height, figure, and color. The Mediterranean is emotional, passionate, wanting in tenacity. He is sociable, but undisciplined, and rarely founds a stable or strong government except under Nordic leadership. He excels in the arts, and in the joy of living. From various causes, the Mediterraneans of today are racially impoverished, and are sometimes, as in Portugal and South Ireland, of very poor quality.

The Alpines are the typical peasants, sturdy, tenacious, stolid and unimaginative. They are not warlike, but have a gift for peaceful penetration, soaking in among Mediterranean populations and supplanting them. The Nordics have conquered them, but have gradually been absorbed by their dogged subjects. In Germany the Alpines have spread at the expense of the Nordics, in France at the expense of the Mediterraneans. Both countries are now predominantly roundheaded. The ruling class in an Alpine population is seldom of the same breed as the ruled.

The Nordics are essentially a northern race. They are distinguished by a restless creative energy, which carried them far to the south and east of their homes. The Aryan conquerors of India, Homer's Achaeans, the ruling class in ancient Rome, the Franks and Normans, were all Nordics. Today their chief hope of racial predominance lies in the United States and in the British Dominions. The Americans have resolved, just in time, that they will not allow themselves to be swamped by alien immigrants. The Nordic has political ability, and is too sensitive of his personal rights to tolerate tyranny. Toward other races he is proud and exclusive; he will not willingly mix his blood with theirs. He loves good living, and is therefore a high-standard man—a doubtful advantage for his survival value. The Nordic is also penalized by his fighting qualities. In every war he is the first to volunteer and the first to fall. Every great war has diminished the Nordic stock. Perhaps the three most disastrous struggles, from this point of view, were the Thirty Years' War, the American Civil War, and the recent Great War.

Common Sense a Characteristic

IT IS probable that the hatred of the privileged class, which has several times led to violent revolutions, has a racial origin. One of the cries against the aristocrats in the French Revolution was "Send them back to the German marshes whence they came." And nothing delighted the small, dark mob who gathered round the guillotine more than when the executioner held up the head of a lady by her long blond hair. In Russia the aristocracy which has been massacred by the Bolsheviks was largely of Nordic origin, and the same is true of Ireland. . . .

Mr. Stoddard's theory makes him a good friend to this country. He considers that we are a very homogeneous nation, since the Alpine roundheads are not represented in our population. This is the more curious, because there was once a roundheaded race in Britain, who buried their dead in round barrows; but they seem to have died out, after leaving (according to one theory) [illegible]d Celtic language behind them. The British, before the English conquest, he regards as pure Mediterraneans, who made their way far north of their usual limit, tempted by the mildness of our climate. To me, however, it seems probable that these Mediterranean invaders mingled with an earlier Neolithic stock, of which nothing is known. The island was inhabited before the coming of the Mediterraneans; and the non-Nordic parts of the population, such as the Welsh, are surely different from the pure Southerners, sturdier in build, and unlike in feature. The Nordic invaders, including the Normans, were all of kindred race, and fused readily with each other.

> In a series of articles in the *Morning Post*, London, the Very Rev. W. R. Inge, dean of St. Paul's Cathedral, under the heading of "Europe Today," makes the following references to the Nordic, the Slav, and the Latin races, and their influence in molding the destinies of the Old World continent.

The homogeneity of our people is a great safeguard against revolution. A foreigner is struck with the quiet, temperate way in which political possibilities are discussed here. Nobody seriously believes that a revolution in England is probable. "The British workingman," Mr. Stoddard thinks, "is about the poorest material for a red revolution that can be imagined." He also finds abundance of coolness and common sense, which he regards as Nordic qualities, in the English character. "Englishmen rarely waste time spinning elaborate logical theories of what may happen in the future. Instead, they look at what is happening in the present, see what is amiss, get after it, and keep their eye on the ball. This is why in the long run they usually come out on top."

Our American friend noticed, when he went to France, the almost universal disposition to belittle England, to deny our achievements, and to predict our downfall. It is very much like what the Germans did before the war. A German once exclaimed indignantly, "Why do you English all look such fools? You deceived us entirely; it was not fair." The French ought to know us better, after fighting by our side; but it appears that they do not. The situation is serious, because we are grappling with gigantic difficulties, from which no way of escape is yet visible. But Mr. Stoddard found that few Englishmen doubted that we shall win through somehow.

I entirely agree with his unstinted admiration of the three Scandinavian nations. He notices the farseeing wisdom which prevented the Swedes from declaring war upon seceding Norway, a war which would have left both at the mercy of Russia; the moderation of the Danes in claiming only the purely Danish part of Schleswig-Holstein, and their good-natured concession of autonomy to the 90,000 inhabitants of Iceland; and lastly, the prudent statesmanship of the Swedes in not taking the purely Swedish Aland Islands from Finland. They knew that a friendly Finland might be very useful to them in the future.

Central Europe Balkanized

WHEN I talked to Mr. Stoddard last year, he was just leaving England for Paris. In France he found a nation intensely unified in government and habits, but very diverse in racial qualities. The reason the French are always stressing their unity and favoring complete centralization is that they are conscious of having no racial unity. Nationality is with them a conscious principle, hardly won and jealously prized. Clemenceau said: "Regionalism (local autonomy) might correct those evils of excessive centralization from which we still suffer so cruelly. And yet somehow we feel that if we relaxed our unifying bonds, France might well be lost." We can understand why the doctrine of race is unpopular in France. Speaking very broadly, Northern France is mainly Nordic, Central France Alpine, and the South Mediterranean. But the Alpines have steadily gained at the expense of the other two. The result is that the French spirit now is very different from what it was in the Middle Ages. There was then a fierce self-assertiveness and a richness of local life which are lacking in the centralized, regulated France of today. The average Frenchman now is hard-working, avaricious, stolid, unimaginative; he is a typical Alpine. The nation stands today at the parting of the ways. Shall France use her mighty army, and her vassal allies, in a great military adventure, or shall she endeavor to stabilize her disordered finances, and become again the self-centered, stable, prosperous nation that she was before the war? Frenchmen have not made up their minds; but Mr. Stoddard hopes that the progressive "Alpinization" of their population may tend to the less ambitious policy, and save the world from a second outbreak of Napoleonism.

There is no "Latin race." The so-called Latin peoples do not get on well together. French, Italians, and Spanish are conscious of deep differences, and instinctively dislike each other. They differ also in that while Spain and Portugal are in a state of eclipse and seeming stagnation, Italy is full of vigor. But in Italy also there is no racial unity. The Roman Empire left the peninsula denuded of its best stocks, and the south remains to this day the home of a mongrel population, racially exhausted. The north has been renewed by waves of vigorous immigrants, some Alpine, some Nordic; it is to these that the country owes its prosperity. But Italian democracy has been a dead failure, and (this is important) has been rejected as a proved failure by the most clear-headed men in the nation. Fascism is the antithesis to Liberalism, because it sweeps away all the shibboleths which the Liberal loves, and asks brutally of each cherished institution, "Does it work? Is it efficient?" If not, why cumbereth it the ground? Parliamentary government, say the followers of Mussolini, may suit Anglo-Saxons; it does not suit Italians—so out it goes! This entirely irreverent realism is a phenomenon of great political importance. The idols of 1789 are tottering on their pedestals.

The military rule of General Primo de Rivera in Spain is not to be compared with that of Mussolini. It is the work of discontented army officers, not of the popular will. In Spain racial differences are not serious, since the population is almost entirely Mediterranean, with a thin Nordic strain still persisting. The Nordic element was formerly very strong, and accounts for the roving *conquistadores* of the sixteenth century. But constant war, emigration, and the Inquisition between them ruined a splendid and virile stock. For three centuries energy and intelligence were steadily drained out of the country. "Castile makes men, and wastes them." Spain is now resting, and will certainly recover; but the tragic end of her days of glory is a warning that no nation can afford to go on wasting its best blood. What great personalities, we may ask, has Spain produced in the last two hundred years?

The history of Germany, which for English readers has been mainly a struggle on the western frontier, has been more vitally a struggle to prevent the Slavs from inundating Central Europe. Germany was left half empty by the migrations into the Roman Empire, and the Slavs poured in till they even reached the Elbe. Politically, the Germans subjugated the invaders, but racially the Alpine race remained and multiplied as the serfs of their conquerors. But disunion was the ruin of the German Nordics, who never recovered from the terrible wars of religion (1618-1648). Since then, the "Alpine" qualities of reliance on authority and disciplined tenacity have displaced the adventurous, chivalrous character of the old Germans. Bismarck, one of the mighty personalities which the pure Nordic race produces, was the ideal ruler of an industrious, docile, Alpinized population. Unfortunately, the new science of race was perverted into an instrument of jingo propaganda. The Pan-Germans confounded national imperialism with race, and taught the nation to believe itself an incarnation of the superman. The result of their tragic adventure was a further impoverishment of the Nordic stock in Germany. But a German industrialist may have been right when he said to Mr. Stoddard: "We Germans can take a lot of punishment; we are just too tough to kill." The modern Germans are in truth a tough combination of two vigorous racial elements; they have dogged tenacity, and they may find another great leader.

The former Austro-Hungarian Empire contained three main races, the Germans, the Magyars, and the Slavs. The Magyars are something of a mystery, since they retain few traces of their Mongolian ancestry. A traveler told me that the typical Magyar gentleman looks rather like an English city man. Two things, however, are certain. One is that the disruption of the Austrian Empire has been a great misfortune for Central Europe, which has been "Balkanized" by the peace treaties, as Mr. Lloyd George ruefully confessed. The other is that, as Mr. Stoddard found, while the Austrian Germans are broken in spirit, and vainly hankering after union with North Germany, the Magyars are angry and defiant, resolved to re-establish their old boundaries as soon as they can. "Everywhere in Hungary one can see maps contrasting the pre-war and post-war frontiers, these maps further bearing the significant words, *No, no, never!*" In Jugo-Slavia and Rumania there are parties which wish to anticipate Magyar ambitions by wiping Hungary off the map. The Little Entente is armed to the teeth.

Eastern Europe is still in the melting pot; there is no appearance of finality about any national frontiers. In this vast region the three European races have been deeply tainted with Tartar blood, which infects not only the Russians and Poles but millions of so-called Jews, who are very inferior to the genuinely Semitic Hebrews. Western Jews ought not to be indignant when Bolshevist atrocities are brought home to Russian "Jews"—they are not really their kinsmen. The most hopeful part of the chaos is Czecho-Slovakia, the Bohemians being a fine race. But even there race-hatred exists; the Germans hate the Czechs, and the Czechs despise the dirty Slovaks.

Keeping One's Blood Pure

POLAND took its religion and civilization from the West while Russia was still barbarous. But the Poles were politically incompetent, and their weakness tempted the land-hunger of their powerful neighbors. The break-up of Russia in the war was a godsend to the Poles; no other turn of events could have suited them so well. But the new Poland is as unwise as the old. It has already quarreled and fought with all its neighbors, and has not a friend in Eastern Europe. "All things considered," our author sums up in good American style, "New Poland seems to be a pretty poor life-insurance risk."

Russia is still an Asiatic country with a European veneer. The Czars ruled like Tartar Khans, and the Bolsheviks have retained all that was worst in their methods. The upper classes, largely of Western origin, have been destroyed, and the "window to the West," opened by Peter the Great, has been closed. The native Russian is a talker, not a man of action. The country seems unlikely to recover without German help.

We cannot follow our author into the Balkan jungle, in which he sees no light. The extermination of the Asiatic Greeks, who have inhabited Ionia since Homer, is one of the worst tragedies of modern times.

The moral of the whole story is, "Keep your blood pure." To admit large numbers of undesirable aliens is the most irreparable of blunders. They may corrupt and debilitate the national type for all time. The Americans have closed their doors, as they had every right to do. When shall we, overpopulated as we are, do the same? How long shall we tolerate constantly spreading ghettos in London, and the *collwvies gentium* which is making the slums of Glasgow and Liverpool, and some mining districts, a factory for political poison gas and a breeding ground of the offscourings of humanity?

The Moffat Tunnel

Concluded from page 13

The Colorado River, on the western slope of the Continental Divide, gives that region greater hydroelectric resources than the Platte River basin on the eastern side, where the city of Denver is located. It is said that practically all of the eastern streams are now utilized to their capacity. The tunnel will facilitate the transfer of power from the scantily populated western side to communities that can stimulate their growth through its use.

The Yampa coal field, which is penetrated by the western portion of the Moffat Road, covers an area of about twelve thousand square miles. This field, according to the United States Geological Survey, has a probable available tonnage of thirty-nine billion tons of a good grade of bituminous coal. Twenty miles northwest of Steamboat Springs there is an area of anthracite coal of good quality of perhaps twenty-five square miles, with a known area of ten square miles. Pennsylvania has the nearest other anthracite coal.

The quality of these coals will enable them to be sold as far east as Minnesota when the tunnel makes reliable and reasonable railroad service available. The high costs of the makeshift line over Rollins Pass and its frequent shutdowns because of snow and storms have combined to make it difficult for the coal measures to be developed as the market warrants.

There are four million acres of Federal farm lands open for patent in Northwestern Colorado to which the tunnel will give cheap transportation. Prior to the building of the present inadequate road, the district it reaches had attracted many farmers whose productive ranges are known throughout the Rocky Mountain country.

Thus, aside from the part it plays in the strategy of a new and badly needed transcontinental route midway in the country, the Moffat Road has local possibilities that justify the construction of the tunnel.

When Denver and Northern Colorado found that private capital could not be enlisted to build the Moffat Tunnel within a reasonable time, the civic spirit that caused Denver to bond itself for $500,000 to obtain its first railroad when the population was 3,000 was aroused.

The city and the counties along the road were organized into a special improvement district. Commissioners to build the tunnel were elected, and $6,272,000 of bonds authorized.

The tunnel can never be sold; but through the lease of railroad, water and wire privileges sufficient revenues will doubtless be received to carry the investment. However, the expected general development through the use of the tunnel would justify the public credit being used when private agencies were hesitant.

The intense cold and heavy snows of the long winters combined with the high altitude of the workings make provisions against pneumonia and other pulmonary diseases very important.

Each man is provided with sleeping quarters of at least four hundred cubic feet with two and one-half square feet of window area and 0.3 square feet of ventilation opening that cannot be closed. Each man has his own bed or cot, and not more than two men use one room.

The tunnel is being built by contractors under a fixed fee form of contract which provides for the division of any savings in the cost under an upset price of approximately $5,250,000, the exact amount depending upon the actual quantities involved.

Dollar Diplomacy—What Is It?

Concluded from page 6

model instead of devising it on the American plan. To be successful, American diplomacy should not imitate, duplicate or trail; it can be successful only in proportion to its impartiality, originality, timeliness, wisdom and energy. Monotonously, regularly, we hear the lamentations of those who attack Congress for not regaling the country with a system and personnel and pay "like Europeans," but after all our best ambassadors and ministers abroad are American business men and American business products.

It is useless to go into analysis; one universal answer covers the problem—that our inexperienced diplomatists, for better and for worse, have been much more successful in the peaceful affairs of this world than all the experienced ambassadors of foreign countries. Nothing is so futile as that overpraised but inexistent diplomatic "career" we hear so much about; nothing is more ridiculous than the office-boy and office-clerk type of work done during working hours, whatever these be, by these diplomatists. Our own have been fairly free from this glittering gilded nonsense, but of late some evidences have cropped up here and there. I have met American representatives abroad who show evidences of becoming as foreign as the foreigners among whom they serve.

I dubbed it Dollar Diplomacy because the mechanical exigencies of headline composition, plus the pressing need of a caption that would mesmerize readers, limited me to the number of letters. Diplomacy was a repellent word; Dollar was a hypnotic word. They did the trick.

Using the capital of our country in the foreign field in a manner calculated to enhance fixed national policies; the substitution of dollars for bullets; the creation of prosperity which will be preferred to predatory strife; taking advantage of the interest in peace of those who benefit by the investment of capital, and recognition that financial soundness is a potent factor in political stability.

That is the Dollar Diplomacy creed. Wilson never changed it; Harding liked it; Coolidge will continue it.

If he can add publicity to it, President Coolidge will become the most famous international figure of the century—bar none.

Shooting the Fox With a Camera

How Reynard Was Beaten on His Own Ground

By E. R. GAMMAGE

OUTWITTING the American fox is the cameraman's hardest task, for he is, as everyone knows, one of the most cunning of all animals.

When I was out in the Big Bend, Davis Mountain country of Texas, looking for everything of interest to

a cameraman, I discovered signs of fox and decided at once to photograph sly Mr. Fox among the natural surroundings of rocks and mountains of his native country. Accordingly, I hid behind some large boulders and focused my camera on a rock which I thought he might have selected as his place of concealment and there patiently waited for him to emerge to scan the country for enemies which might be lurking about. He took his time about this, however, and there behind those boulders I did my hardest day's work as I waited for hours to photograph this wise old fellow.

The fox is closely related to the dog and the jackal, but differs from them by its sharp muzzle, erect ears, vertical pupils of the eyes, and the long and bushy tail.

There are several kinds of foxes which are common in different parts of the world with the exception of South America, "Foxey Grandpa" being the only "fox" of South America.

The Red fox of America resembles the common fox of Europe and Great Britain but, nevertheless, has a few slight variations which distinguish it. Its head and body will measure approximately thirty inches and the tail about a foot and one-half in length. It has a reddish-yellow-colored fur with tips of black on ears and tail and a white line on its belly.

The American Yellow fox is regarded as the most cunning animal in the world, and is often able to outwit American fox hunters and their hounds in the chase. It robs hen roosts as well as mother goats, sheep and hogs of their young.

The Grey fox is a timber fox which, along with its other cunning attributes, possesses the power of climbing trees. It is, however, becoming more and more scarce with the gradual disappearance of our forests. Most foxes live in burrows.

The Arctic fox, which ranges southward to Labrador and Newfoundland, has beautiful silky fur which is a bluish or brown color in summer and a pure white in winter. Fox skins are always in steady demand in the fur market.

The best skins come from Yakutsk, Kamchatka, and Russian Lapland, and are in their best condition from November to January.

American Libraries Lead in Service

Concluded from page 9

the Bibles, the British History and the French History Collections, and the German History Collection which perpetuates the name Hohenzollern. However, some are of a nature to gladden the heart of the pure collector, being collections undefiled by any scholarly implications that are not inevitable. Harvard has a wonderful fish collection, or rather one "on angling," to be more bibliographical. Izaak Walton's "Compleat Angler" of 1653 is to be found in more than 160 out of 170 known editions, varying in size from that of the "thumb edition" (2 by 1¾ inches) to the edition by "Lea and Dove" in two large folio volumes. One of the books touching fishing dates back to 1471. The Magna Charta mentions fishing and so this collection includes a copy, that of 1556, which belonged to Mary Queen of Scots. This collection numbers more than twelve thousand volumes with books in twenty different languages, prints and pamphlets by the hundreds, and long sets of journals devoted either to fishes or to fishing, which brings strange bedfellows together as fishes and fishing are essentially different topics. Needless to say the enthusiasm of a collector is responsible for this aggregation of books, as Harvard has no more natural interest in fishes than many another college. The collector was Honorable Daniel B. Fearing, of Newport, who spent wisely and with great profit and pleasure to his soul many years in the accumulation of these treasures which will now be kept together for generations to come.

Bostonians may wince if we mention the fact that across the river from Cambridge lies Boston. As a book center of America Boston revolves about Harvard. However, even apart from the college Boston would be a library center. The Boston Public Library is one of the largest libraries in America, one with great devotion to public service and housed in a building which is itself a work of art. The Boston Athenaeum, the Massachusetts Historical Society, the Massachusetts Institute of Technology Library, and a dozen others are worthy of honorable mention, contributing to place Boston on a par with New York and Washington.

One may well hesitate to attempt to describe the Nation's storehouse of literary treasures, the Library of Congress. Here are thousands upon thousands of manuscripts, here is lodged the finest collection of early American newspapers, here is the finest collection of maps and atlases relating to America, here are deposited the fine books and also much trash issued under the American Copyright Law. Washington is probably the most beautiful city of the world and the Library of Congress is its most enduring ornament. The Library of Congress is worthy of the place and of the Nation. Having mentioned Harvard, naturally the other colleges expect mention. Yale has more than a million books (as well as a good football team which receives more press notice); at New Haven the four-million-dollar Sterling Memorial Library is under way. Brown University has on its campus the John Carter Brown Library, easily among the most notable of libraries of Americana. The University of Michigan has a remarkable general library of half a million volumes, together with the William L. Clements Library of Americana, one of the greatest gifts ever made to any university. The Universities of Illinois, California, and Pennsylvania all come in the half-million class, with Princeton older but no larger, and all growing with tremendous strides. Cornell, with noteworthy special collections on China (1,000 volumes), on Iceland and on Dante and Petrarch, is in the three-quarter-million class, with Wisconsin and Chicago. Without fear of contradiction one may assert that our universities have now awakened Europe to the fact that there are books and all the trappings of scholarship even in America.

No American library has aroused more amazement than the Henry E. Huntington Library at San Marino, a gift to the people of California by the most famous collector of this century. Within some thirty years this library has been formed which, in the field of early English literature, disputes first place with the British Museum and the Bodleian at Oxford. Here are found the first edition of Hamlet, 1603, one other copy in the British Museum, and the equally rare Venus and Adonis by Shakespeare. This library possesses the only known copy of the Laws of Massachusetts printed in that state in 1648. Lincoln's Notebook and Franklin's Autobiography for which $80,000 was paid are in company which is worthy. The library is not designed to have more than a quarter-million books but it is even now recognized as one of the great libraries of the world.

Chicago boasts several libraries of international fame. The Newberry Library includes Americana gathered by Edward E. Ayers with the finest collection in the world on the American Indian and also the more recent typographical library, the John M. Wing Foundation, to illustrate the development of the printing art. The John Crerar Library is devoted to science, comparing favorably in the various fields of science with far larger libraries. The Chicago Public Library, Northwestern University Library at Evanston, the Chicago University, The Armour Institute, and various theological and other special libraries make Chicago a growing center, particularly since there is quite well established specialization in purchasing the more expensive items so as to avoid duplication.

Cleveland and Pittsburgh are up and coming strong, both having a citizenship accustomed to making large gifts to the community.

In the South, Baltimore and New Orleans and Austin, Texas, are the three outstanding library centers. There is plenty of public spirit in the South but there is comparatively little wealth.

The fortune of Andrew Carnegie has made possible fine libraries in three thousand American cities. Approximately $100,000,000 has gone into these Carnegie libraries and who will say that it has not been well spent with continuous dividends for years to come. A wise provision in all Carnegie's gifts provides for maintenance of the library by the community in which it is located.

At the present time the American libraries have devised a system of inter-library loans which make it possible for the student to use in his own city library books borrowed from Washington or Boston or Chicago or New York.

Not the least noteworthy movement in our libraries is the attention paid to children's libraries. Systematic efforts are made by schools and libraries and even museums to interest the younger generation in books. This movement potent in promise is already bearing fruit in a wider American interest in good literature. Were there in every home a small library, a few good books like those which Lincoln thumbed so diligently, then many of our agencies for reform would have less to do.

The wonderful growth of the American libraries is largely the work of the past 30 years. The public libraries and university libraries have tripled in that time and the use has increased tenfold so that European libraries are now studying American methods of bringing books to the people. It is also safe to say that the scholarly use of the library treasures has increased in a generous measure—justifying their possession in America.

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

A new school for the education of rabbis has been opened under Soviet auspices at Leningrad, according to the Jewish *Daily Bulletin*. The conditions include instruction for one hour a day in political economy and three hours a week in the history of communism. There are 2,000 rabbis in Poland waiting for admission to the United States.

Immediately before Easter Sunday in Spain, everything is closed, but, on the afternoon of Easter day, bullfights, cafés, and theaters all come in for their share of attention.

A Bible and a hymnal are part of the kit of every Chinese soldier under General Feng Yu-Hsiang.

Garlic was distributed as a tonic to the laborer who raised the pyramid of Cheops.

The youthful Amir of Afghanistan encourages home industries. If he sees an Afghan wearing foreign-made clothes he slips up behind and slashes the clothes apart with a penknife, kept sharp for that purpose.

Cork trees of Algeria are stripped once in nine years after the age of fifteen, and give an average of fifteen harvests of a hundred pounds each.

Mother polar bears frequently have three cubs at a time.

There are 2,000,000 "radio pirates"—that is, people who have installed indoor listening apparatus of their own without bothering to pay the required license fee—according to British official estimates. Over there, radio is not "as free as air."

The light in Bishop's lighthouse, off the southwest coast of England, weighs several tons, but can be revolved by a child because it rests in a circular trough of mercury.

The first known trade-mark is Nine Stars, adopted by a business house in ancient Carthage. This house manufactured a delicious fish sauce which it packed in hermetically sealed pitchers, marked with nine stars, and sold throughout the then known world.

Stenographers in Germany have cocoa or coffee in the morning and afternoon. This is a relic of the old custom of having five meals a day.

Arthur Law, a cotton spinner, and representative of Bolton in the last Parliament in England, being ill and unable to obtain employment, was compelled to sign for unemployment pay with the local labor exchange.

Frank L. Stanton, nationally known as the writer of the South's best lyrical verse, has been appointed by Governor Walker as poet laureate of the State of Georgia.

An average of ninety-four tornadoes occurs every year in the United States.

Oil of cedar distilled at small cost from cedar wood waste is used to impart the necessary cedar aroma to boxes and containers used as cigar boxes which are made of other woods.

A valuable shipment of furs, sent from Prince Edward Island to Oregon, consisted of 100 black and silver foxes valued at $100,000.

Residents of Brush, Colorado, and the vicinity thereabout, killed more than 32,000 rabbits and loaded 112 tons of juicy, corn-fed rabbit meat into five box cars. The rabbits were distributed to the poor of Denver.

When an inhabitant of Little Russia wishes to indicate that a man is very strong, he says, "He is a haymaker."

One rarely sees anyone chewing gum in Berlin.

The tombstone of Eurysaces, the pastry king of Rome, was in the form of an enormous cake, which also served as an advertisement.

"Fib" is an abbreviation of fable, an improbable story.

Green County, Wisconsin, farmers are advertising their Swiss cheese by yodeling in the radio.

The theatergoers in Berlin take sandwiches along, which they eat between acts.

"On tick"—getting things on credit—is derived from the days when storekeepers gave tickets containing the amount charged instead of making a ledger entry.

A Frenchman is privileged to have two wedding days, the civil and legal marriage preceding the church wedding by twenty-four hours.

Kangaroos outnumber sheep two to one in the Australian Northwest where they are proving a nuisance.

Five hundred dollars was paid for the destruction of a wolf which had killed $25,000 worth of cattle and sheep in Arizona.

Oak trees are more attractive of lightning than other kinds.

A soft collar for men has been worth $1,000,000 in royalties to its inventor.

"Dago" is derived from the Spanish form of James, and San Diego—or St. James—is a common name in South American countries.

The Greeks originated shorthand.

"A collie has the brains of a man and the ways of a woman," says an old Gaelic proverb.

According to Arab lore, the date tree must "have its head in the fire and its feet in the water," if it is to prosper.

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in the papers all the stuff published about the end-of-the-world furor. Not because I was interested in the end of the world, but to observe what publicity can do to people. The idea began with a few obscure persons who were ordinarily out of newspaper purview altogether. Poor, misguided as they were, flying in the face of the very revelation on which they pretended to base their conclusions; they were not nearly so misguided as were the flippant journalists who made the matter a thing of national importance. The people who committed suicide, who sold their property, who destroyed their standing in society, certainly would not have been moved to do so without newspaper aid. These tragic occurrences must be laid at the door of those who thought it worth wire tolls to telegraph from one end of the country to the other the vagaries of people whose opinions on any subject would have no intrinsic value. I noticed also that the newspapers did nothing whatever to enlighten people concerning the religious beliefs involved. All of us from childhood have heard talk of "the end of the world." It is generally supposed that the idea has a basis in the Bible. No newspaper, so far as I know, told the people that "world" in the Bible often means "age." "The end of the age" has quite a different meaning from "the end of the world." This "age" will end, as others have before it, and insofar as it is bad, we want it to end. We want the "next world," the next age of justice and righteousness. Instead of fearing that, men in every sort of accent are asking for it. That is what all our reform movements mean; dumbly it asserts itself in all the forced changes that occur. But an age changes slowly; the end of one and the beginning of another is decreed, but the change does not occur on a stroke of the clock. The New Age is already here in its beginnings, but the old age still hangs on, vestiges of it remain. They overlap. If the religious teachers of the nation had seized the opportunity to tell the people what the idea represented, what the very phrase, "end of the world" means in Biblical usage, the weeks of trivial talk through which the nation wandered might have been redeemed to some increase of knowledge on the part of the people. But the opportunity was lost.

I have heard—I don't know how true it is—I only know that those who say it ought to be in a position to know, that there is considerable "inside" disappointment at Washington on account of the President's Cabinet appointments. Not disappointment *with* the appointments, but because of them. It is actually said by those who seem to know that Mr. Hoover was receptive of the Secretaryship of State and that Eugene Meyer, Jr., was, if not expectant, then receptive of the Secretaryship of Commerce. It was hard to believe that either of these men had any hopes in the indicated directions. Hoover in the Department of State would be a spectacle for men and gods. Meyer in the Department of Commerce would constitute a serious blunder. Say what you like about "experience" but too much Washington experience unfits men to serve the Nation. The professional officeholders, like the Hoovers and the Meyers, who can afford office because of their large private fortunes, are not the kind of stuff of which to build a government.

I read in the papers that hotel men the other day reported that about 95 per cent of hotel guests were honest. This looks like a very high percentage until we examine the negative side. Five per cent of hotel guests are dishonest, which is rather too many, at all, at all! To think that of every hundred guests on the hotel floor you are occupying, five of them are thieves! Dishonest hotel guests appear in three classes: those who try to evade payment of the bill, those who actually succeed in doing so, and those who love to secure "souvenirs" in the form of towels, table linen, and an occasional spoon. It is rather startling for an unsophisticated stranger who has done his best to live "the white flower of a blameless life," to discover on his hotel towels such legends as "Stolen from the Hotel Magnifique," or to have his appetite taken away by seeing the same inscribed on his serviette. It reminds him of the dark line that runs through human affairs. It throws him, willy-nilly, into the uncomfortable sense of being regarded as a possible member or recruit for the reprehensible five per cent. We wonder if such crude methods are necessary. Why penalize the decent public? Why not seize and prosecute the thieves? Instead of always reminding the 95 per cent of the blacklegs, why not put the latter in mortal fear of the former?

I read in the papers that the map which served to inspire the voyage of Columbus to the New World is carefully stowed away in a wooden box, less than a yard long, in the National Library in Paris. It is a hand-painted chart of the design known as "Planisphere," which means the representation of the circles of the sphere on a plane; especially a projection of the celestial sphere and the stars on a plane passing through the Arctic or the Antarctic circle. This map is believed to have been presented to King Ferdinand and Queen Isabella by Columbus when he went to Spain in 1491 and asked for vessels with which to cross the Atlantic. The map was bought for $50 in 1849 at a sale of books, and today is estimated to be worth many thousands of dollars. In spite of this one wonders why some effort has not been made to bring it to America, for that hand-painted chart was the real charter of world expansion and of the universal liberty which we enjoy today.

MR. FORD'S Page this week deals with the power of excessive taxation to discourage ownership. The greater the number of possessors of a definite, tangible stake in the country, the more stable and secure the nation.

"WE, THE people of the United States" belongs in the Constitution, but not in the Amendments, for the Constitution was referred to the people for action by conventions chosen by the people for this express purpose, and the Amendments were not. Amendments are passed upon by legislatures chosen without reference to them. If you want to know the interesting facts about altering the Constitution, turn to page 11.

Editorial Comment, political, foreign, human. (p. 8)

TOM MASSON, for thirty years editor of *Life*, America's greatest magazine of humor, asks if America has produced a literary genius. As a man who has known most of the literary lights worth knowing, he is competent to discuss the question, which he does with a freshness which even literary people will like. The unliterary, being the real makers of verdicts in the realm of letters, will read it with delight. (page 2)

WHEN bootleggers are appointed to be Prohibition enforcement officers, what chance has a poor law got? Yet that is what sometimes happens. An insight into the condition which has become so bad as to force government correctives into action is given on page 10.

"I Read In the Papers"—observations, wise and otherwise. (p. 16)

AS WOODROW WILSON was driving through the White House gate to his second inauguration, the splendid black horses that drew his carriage slipped and fell. "Oh! bad luck, bad luck!" screamed a woman from the crowd. Before his first election, Mr. Wilson expressed his entire confidence in winning the campaign, but, said he "I cannot meet this great honor with delight, for I see over the horizon a black cloud that gives me an ominous feeling I cannot dispel." Huston Thompson who heard the remark, and four years later heard the woman's scream, tells of the last phase of Woodrow Wilson's life, thus closing a notable series of reminiscences. (pp. 4 and 5)

A picture of Spanish women. (p 3)

THE flavor of old and odd things is to be found in the quaint conduct and philosophy in which the children of a century ago were trained (p. 6) and the forthright bravery of the days when Americans knew more of the deck and the mast than of the tonneau and the gas tank. (p. 9)

DID you know that the Swedenborgians had a beautiful cathedral in this country? Neither did we until we saw this article. (page 12)

A MINOR page from American history contains the story of the Maine boundary, and the trouble it gave to two governments. (p. 15) Jumping from the northern to the southern boundary, there is a sketch of Mexico's thirteenth president in fourteen years. (p. 13)

Has America Produced a Literary Genius?

A Breezy Discussion Ranging From Laura Jean Libbey to William Dean Howells

By THOMAS L. MASSON

IN THE winter of 1907 I was present at a birthday dinner which was given to W. D. Howells by George Harvey, to commemorate Mr. Howell's seventieth birthday. It was a large and distinguished gathering. President Taft came from Washington specially to be present. All the *literati* of the day were there—men and women. Howell's daughter Mildred sat with him at the head table, and a great deal was made of her. Gus Thomas made a speech—among many others—and brought down the house when he said that he and Howells were the only uneducated men present. He referred to the fact that neither of them had been through college.

George Harvey, who at that time was the head of the House of Harper, had staged the whole affair, just as he staged the dinner to Mark Twain, on his seventieth birthday, two years before that. George Harvey was a past master at the somewhat vulgar art of staging dinners to authors whose works he was booming. In those days he had an enormous lot of pep, and this pep carried him well through the war, when he ran his paper, *Harvey's Weekly*. But he seemed to have lost it when he became Ambassador to Great Britain. London has tamed him; his force and fury have evaporated into the unsubstantial and misty atmosphere of a Washington editorial sanctum. Thus great press agents pass.

Mark Twain's Oft-repeated Speech

I was also present at the dinner given to Mark Twain in 1905, and the difference in the affairs was very noticeable. Mark Twain fairly reveled in the adulation ladled out to him. Mildred Howells, next to whom I sat, before Mark Twain spoke, told me that he had been living at their house, and that for six weeks she had heard nothing else but that speech. It was a good speech, as all of Mark Twain's speeches were. He was a past master himself in playing up what has now come to be known as the inferiority complex—in itself a species of egotism—and he dilated on his own wickednesses, to the enormous glee of the audience. After he spoke the dinner lagged a bit, until toward the last a young man, who had never been heard of before, got up and caught the audience at once with a wonderful talk. His name was Rex Beach. Since then he has come to be more or less famous.

The Howells dinner lacked the adulation tone of the Twain dinner. Howells was plainly weary. Under the forced gaiety of his fine face could be discerned that kind of fortitude which really modest men develop in the face of vulgar flattery. He read what he had to say, and read it rather poorly, in a low voice. It was all good, but it was too literary to catch the audience. Afterward it was printed in *Harper's Magazine*.

It happened that some years before that, I had attended a reception given at her home in Brooklyn by Laura Jean Libby, the then popular woman author whose "Lovers Once But Strangers Now" may sound familiar to some of our older readers. Miss Libby died only last year. But it is not too much to say that twenty-five years ago, she was the most popular "low-brow" novelist of the day. At that time she filled more completely the field now occupied by the work of Gene Stratton Porter and Harold Bell Wright. She was the natural outgrowth of The Family Ledger, of Godey's Lady Book. With her, sentimentality was not only a passion, it was a religion. I have always admired her, because she was so much in earnest. Her self-advertising was not the artificial, smart, obviously efficient self-advertising of today; it was the outcome of her sincere belief in herself, in her "art," in her mission and as such it deserved respect. Every year she gave a reception. I was told on the best authority that she got most of the names out of the social directory and the telephone book. Her invitations were spread among the élite, and a few always responded; of course, she sent them to the *literati*. She had made a good deal of money and lived in a fine house, filled with ornate furniture. There was a small mob. She stood at the door, clad in what looked like a wedding dress, with a magnificent bunch of American Beauties in her left hand. She was all dignity and graciousness. At her side stood a violently red-headed young man, who looked like the middle-weight amateur champion of the United States. She introduced him to me as her "poet." She was proud of him. I inquired and was told that Miss Libby hired him to write the poetry to embellish the love passages in her novels. I liked this about her very much; it showed good judgment to relegate that part of the work in which she was weak to another, and along with that, to make him stand by her side and give him all the credit. That idea is the foundation of modern business. Miss Libby was a pure, sincere, fine, if somewhat mistaken, soul.

"Deans" of American Letters

Now I have touched thus briefly upon these three personalities, because, in a broad, popular way, they represent fairly well the whole of American literature. At the dinner given to him, Mr. Howells was proclaimed the "Dean of American Letters." There was no doubt that, up to his death in 1920, he held this position. There is at present a tendency to reclaim him; in a small way, Mr. Howells is coming back. His novels are again being discussed in limited literary circles. But, practically and definitely, Who reads him? What does he really amount to?

He is a delightful writer. And that is true of a great many others. It is certainly true of Mark Twain. It is true in many respects of James Russell Lowell, who in his time was likewise proclaimed the "Dean of American Letters"—and who reads him now? *Is there any name in American literature, from Hawthorne to Tarkington, destined to "live"—as they say?*

This brings us face to face with the question which has never been properly answered, but which I believe can be answered, and which I shall attempt to answer in connection with my theme—namely, What is genius? But before going on to answer it, let me say briefly that, as far as writing is concerned, I think our readers will agree that all writers may be roughly divided into six classes: poets, dramatists, novelists, philosophers, historians, and essayists. It must be remembered that Humor is a by-product of literature. Its very nature depends upon its being incidental. There are no great humorists who stand alone by themselves, as humorists. This would be impossible. Dickens, of course, is a great humorist, but he is much more. Mark Twain, in the long range of time, is a real humorist, but he is much more; he is a delineator of boyhood, of a certain stratum of American boyhood.

In these six departments I have mentioned, can we say that America has supplied first-rate genius? Certainly we can show no great dramatist. Our novelists, or writers of first-rate fiction, can be numbered on the fingers of one hand, with some to spare: Hawthorne, Mark Twain, perhaps Herman Melville (who has so recently been cast up at us from the sea) and in modern times possibly, but doubtfully, Henry James, W. D. Howells, Edith Wharton—all very doubtful. Have we not exhausted our philosophers when we mention Benjamin Franklin and Ralph Waldo Emerson? And the name of the latter comprehends our chief essayist, although I confess to a sneaking admiration for Paul Elmer More. The historians, such as Parkman, Prescott, Motley, Bancroft, Adams, McMaster, and Rhodes, while extremely interesting and useful, are certainly not to be classed as great geniuses, in the sense that Gibbon and Thucydides and Macaulay were geniuses.

Only Two Facts Are Included

We have only the poets left, and two of them—Edgar Allan Poe and Walt Whitman—have commanded the attention of the English, and indeed European, world. Some English critics think that Walt Whitman is the only first-class genius that America has produced. Others include Poe. As far as we ourselves are concerned, it is significant that Poe's name was withheld from our Hall of Fame until 1910. As far as the world at large is concerned, then, that is about the situation: Of all the writers America has produced since it began, two poets—Poe and Whitman—are haltingly declared to be our only entries to the sacred company of world immortals.

What difference does that really make and is there not just as much to be said on the side of the ephemeral? Is Mr. Howells' "Venetian Life" or his "Silas Lapham" any less delightful because, for example, Mr. Edmond Gosse or Mr. George Moore have never—possibly—heard of him? Must we stop reading Mark Twain, or, say, Booth Tarkington's next novel, because a young woman critic from London tells us privately that neither of them will live? Indeed, there is much to be said for the short-lived book, for the fleeting author! I have in my own library a small group of books that nobody ever heard of, and pore over them with constant delight. All this does not answer the question, What is genius? which I now propose to answer, first, by stating what Genius is not.

Genius is not necessarily the ability to produce works that are permanently popular, or even permanently known. Genius is not the original, creative product of certain individuals; it is merely something, the excess of which these individuals are obliged to work off—in fury, in passion, or in long bursts. Shelley's "Lark" is not Shelley; it is something that Shelley caught out of the air.

Genius, then, is the expression of a universal force that comes in through an individual in some manner, the mystery of which we cannot account for. That is about all we can say of it, by itself. We can, however, say a great deal more of it, by its manifestations and workings. To understand these things, we must get rid of some of our false notions about the machinery through which genius works. We must pay only so much attention to the individual as is necessary, to see how the genius works through him. For instance, in Shakespeare's time there were a great many minor Shakespeares. There had to be, to produce one like him. A lot of dramatists tuned in, and among them all, he was the best.

We see the same process now going on, right here in our own land. Short stories are all the rage. There are, literally, thousands of short-story writers. Back of it all is the economic urge. It seems an easy way to make money, and as everybody wants to increase his earnings, and very few succeed, there are a great many persons trying to make money in this way. Owing to this stimulus, the art of short-story writing has immensely improved in the last few years. Among so many thousands who are trying, there are sure to be a few, through whom this kind of genius is best expressed. Genius is not a separate entity, which comes in original packages and is handed out, unbroken, to a few. Everybody has it, more or less. *Our illusion about what genius really is proceeds entirely from the fact that we lay too much stress on recognition.*

We Lay Too Much Stress on Recognition

When the question is asked, "Has America produced a first-class literary genius?" the superficial answer is precisely what we think it is: No, probably not, with the possible exception of Poe or Hawthorne or Emerson or Whitman. But we must remember that *writing, in itself, is a small part of the total record.* There are many other ways in which genius, and super-genius may express itself.

The general characteristic of all genius is to express itself in some form of what, for practical purposes, we term Art. And when we come to define Art, we are in the same dilemma as with genius. Most of the authorities disagree. A small group of intellectuals in New York or Chicago, who live and move and have their being—whatever that is—in frank and slavish imitation of decadent European circles, will get together and pronounce a new book, written quite possibly by one of their own clique, a work of "art." Doubtless it is "art" for them, but not for anybody else. In a year or two it is forgotten. But a true work of art, as the world goes, is one that persists over generations and still holds its own. And the qualities which make it persist are that it is what we call fundamental. It is always fresh, always modern. If you will pick up and read one of Plato's dialogs, you will think that two men you have always known have got into an argument. There is a Socrates in every hick town.

Perhaps the strongest sign of genius is its utter shamelessness. I have heard Walt Whitman often referred to as a "dirty old blackguard." They tell me that the room in which he lived was a sight to behold. I have just been reading the latest collected edition of his poems. Their utter and complete shamelessness rises up and strikes one in the very face. This same quality of shamelessness appears in some form in all geniuses. In some cases it is called courage; in others, an absence of conventionality. Or else a genius is spoken of as one in revolt. All these definitions are misleading. There is not really anything the matter with true genius; the trouble is with the rest of the world. True genius is the most stable thing there is; it is a steady flame that never goes out.

Genius Cares Nothing for What Happens

In addition to this thing I have termed shamelessness, genius has another quality worth mentioning. It ignores its material body, that is to say, it never stays put in its material environment. Genius cares nothing, apparently, for what happens to it, materially. There seem to be exceptions to this rule, but they are not really exceptions. The genius is able to get glimpses of reality; and these glimpses upset him so—as far as this material world is concerned—that he cares not a rap what happens to him materially, as long as he can make something, or do something, or write something, which will put on record what he sees as real.

It has always seemed to me, as long as I have been able to think about it at all, that America, among nations, has a kind of genius for self-government, a sort of vision of national reality which other nations have not. If this is true—and certainly all of us hope that it is—then, this is much more important in the long run, than the glory of literary masterpieces. Besides, if it should happen to be true—if we finally emerge from much of our money wallowing and our sob stuff and our indecencies, into such shape that we can say to the rest of the world, "Do not only as I say, but as I do," then the literary masterpieces, the outpourings of genius, are certain to follow—such as have not been known in this world before.

Spanish Women—A Transformation

Mantillas, Red Roses, Guitars and Orange Blossoms Are Now Rare

By EVELYN M. VIGORS

SPANISH women! What delightful vision far removed from our matter-of-fact world did the words once present to me. Spanish women! There was magic in the sound. Mysterious mantillas, woven from black and white cobwebs, floated before my eyes; I saw high, romantic combs; crimson, velvety roses in dark hair; *mantons* with delicate, silken fringes, profusely patterned like outrageous butterflies with scarlet and green on black or yellow. I heard the twang of guitars; smelt the sweet, entrancing scent of orange blossoms on the air; saw moonlight shining on smiling, ivory-complexioned faces murmuring to their lovers from behind barred windows . . . . That is how I pictured Spanish women before I was disillusioned by reality. That is still the rare picture on nights of fiesta in the spring at Seville. But it is an episode not a complete play—one of the details of a Spanish woman's life. Her mantilla, her comb, and her *manton* are only for the bullfight, for weddings, for feast days. Ordinarily she wears black. She wears crape and mourning for every distant relation she loses. If a widow she will probably never wear colors again.

In Andalusia, where Moorish customs and influence still largely prevail, the women of all classes are housewives, if not house slaves, first, last and always. The traditional window bars are the bars of a prison. The care of their families—cooking, sewing, cleaning—fully occupies these women. Frequent visits to church supply their only spectacular entertainment. Besides ironing, washing the clothes in a neighboring stream, and carrying water for the house in earthen jars little or no manual labor is allowed or expected of them.

In the north of Spain and even in Old and New Castile, the country women work in the fields and on the land as hard as, if not harder, than the men. They are strong mentally and physically. Their husbands appear to be incidents in rather than masters of their lives. One cannot imagine the peasant women of Northern Spain submitting to the law which empowers husbands to dispose of their wives, like bits of furniture, as they think fit. The woman rules the roost. Although the contrast between the peasant women of north and south is so marked, all Spanish peasants, men and women, are united by one common link—their firm belief that their own village is the most beautiful, the most flourishing though always, in the face of the most difficulties, the most famous; in fact the most perfect and desirable spot in Spain if not in the whole world! Says the Asturian song with complete confidence:

> "I am from Pravia,
> And my mother is a Praviana
> Therefore I can do no evil."

while the Andalusians are content with:

> *"Viva Sevilla, Sevilla, Sevilla,*
> *Viva Sevilla, Sevilla, ad infinitum.*

In Spain, as in most countries, it is the upper classes that are the most strictly conservative. Spanish conservatism is something of which the most conservative American can hardly conceive. It stands for political and religious intolerance and repression, and endeavors to keep out of Spain the modern tide of education. It is a powerful and determined enemy of democracy in even its attenuated forms. It is reactionary to a degree unthinkable in most civilized countries. Practically all Spanish women of aristocratic families are carefully brought up in this tradition. Their daughters never move without chaperones except perhaps to church in the morning. Two or three girls are not allowed to chaperon each other even at the cinema. The average upper-class woman lives a secluded life. She attends to her household duties in the morning, no matter how many servants she employs. She takes her drive down the Castellana in the afternoon. She meets her friends in one of the little, fashionable tea shops, or at a tea party in a friend's house. At the parties and receptions the men and women gather in separate groups at opposite ends of the room. Sometimes the women fade altogether to another room. I know an American couple

Spanish ladies in the audience at a bullfight Seville.

who always bid each other farewell before they go to a Spanish tea party. The women will talk of their homes, their children, the latest play, a recent film, they may dip into the arts, so and so's picture exhibition, someone else's sculpture, or perhaps! discuss a new book. They will rarely mention politics unless to say how fortunate there is once more a conservative government in England.

Marriages in Spain are generally arranged. Spanish girls have little opportunity of knowing young men intimately. Spanish boys entertain their friends anywhere but at home for fear of being accused of trying to get husbands for their sisters. Restricted by all the conventions as Spanish girls of the upper and middle classes are, when engaged to be married they have even less liberty. They may only dance with their fiancés and if they are away the girls must not dance at all. They may scarcely look at another man. Some fiancés, I am told, give their fiancées lists of what they may or may not do and of what they may or may not wear mentioning in some cases, even such intimate things as corsets! Once married, the Spanish woman is entirely under her husband's control. A Spaniard can, on mere suspicion of his wife's fidelity and without proof, shut her up in a convent for as long as he likes. And yet every Spanish girl wants to be married!! On certain days outside a well-known church in Madrid long queues of girls of all classes may be seen. Inside the church they light a candle to St. Anthony and pray for a fiancé. If the candle remains alight it is a sign they will have a fiancé within the year. If the candle blows out the prayer will be unanswered! Sometimes, aggrieved at St. Anthony's refusal, they return home and turn the saint's picture to the wall. Others, more violent, may seek revenge by beheading the poor saint's statue!

When one remembers that in polite society it was considered indelicate up till quite recently for a girl to sit with her knees crossed, it is easier to realize the revolution effected by the first girl who some ten years ago was brave enough to wear breeches when skiing and tobogganing in the mountains near Madrid. Her example, which at first shocked and outraged and which has since been generally imitated, indicated that the influence of the more modern and liberal ideas about women, disseminated in Spain by a small group of idealists and intellectuals, was being felt. This group has encouraged women to undertake business and professional work, though public opinion—if one can apply such a term to Spain—does not favor this emancipation. Besides initiating co-education in Spain, these intellectuals have crystallized their ideals in various educational centers, including a residence for university women, where games and sports have an important rôle.

The middle class, though in a minority here, is more liberal about women than the conservative upper classes. Women recruits to the professions and to the business world come chiefly from the middle classes. Although most of the professions are nominally open to women they have, when taking up any work, to face the cynics who regard all women workers above the peasant class as adventuresses, and who claim that girl students at the university are seeking for husbands rather than for knowledge. So strong are social prejudices that most Spanish girls prefer poverty to the opprobium their well-earned money would bring on them if they worked. Two girls I know were both in great need of money. One, imbued with modern ideas, earned enough to appear presentably clothed. The other, miserably dressed but dominated by pride and tradition, scorned the very idea of earning money, and, although too poor to buy herself new shoes, insisted on having a paid chaperone to escort her when she walked abroad.

Spanish women have a long journey to go before they can take their place among their emancipated sisters in America, England, and other enlightened countries. But they have started on the journey. The municipal vote, in a limited form, was recently granted to women in Spain, and in acquiring this they left French women behind. A small, undenominational group of women, the first and, I think, the only group in Spain to have an entirely feminine executive, has been working here for universal suffrage for some fourteen or fifteen years. These women feel assured they will obtain their goal very soon now. They believe Spanish women are wanting better conditions, and that they need only encouragement and more modern education to enable them to participate intelligently in politics. Spanish women are naturally quick and intelligent and when fully roused their influence should be enormous. The results of this influence are at present difficult to foresee. The recent appointments of several women to municipal posts for the first time in Spanish history is considered a feather in the feminist cap, though it is recognized that as these women are not from progressive groups their votes are more likely to represent outside control than individual conviction. These are arbitrary appointments and are out of touch with the true spirit of Spanish feminism. The chief argument against giving women the vote is put forward by the progressive parties who claim universal suffrage would swell the reactionary vote. This is answered by a counter claim that the reactionaries among the women—mostly of the upper classes—would not be sufficiently interested to vote, as was shown by their recent refusal to register at the municipal elections, and that, therefore, votes actually cast would favor progressive parties. No change in the legal status of women is expected to take place until the Dictator, Primo de Rivera, returns from Morocco, but it is thought he is not unfavorable to universal suffrage. Meanwhile Spanish women are gradually awakening to their own limitations, an awakening which is bound to precede any whole-hearted efforts for better conditions and wider fields of activity.

Wet Congressmen Who Vote Dry

By BURT M. M'CONNELL

A CONGRESSIONAL investigation of Washington in general and official Washington in particular is one of the possibilities since it became known that several members of Congress who consistently vote "dry" brought into this country, in violation of the law which they helped to enact, a considerable quantity of liquor. They were able to do this without detection because, in the first place, they were returning from a "junket" to Panama, and in the second place, being Congressmen, they were entitled to "the freedom of the port" in question.

Now, a steady diet of Congressional investigations becomes monotonous. And it may be that the "wets" in Congress are making matters appear in the worst possible light, to bring about a more liberal revision of the Volstead Act. Nevertheless, the wetness of many "dry" Congressmen is notorious despite the fact that Congressmen are pledged to obey the law and *support the Constitution.* If prohibition is good enough for the average man (thinks the "average man") it ought to be good enough for those who voted to make it the law, and who annually appropriate millions of the taxpayers' money to enforce the law for everybody but themselves.

Those familiar with Washington life have known for a long time that nowhere else in the United States is the Prohibition Law being flouted more brazenly than in the nation's capital. The very Capitol has become a "house of a thousand scandals." If any city in the country should be a model for the enforcement of prohibition, that city is Washington. In the District of Columbia, Federal and local governments are virtually identical. The President and his Cabinet; the nation's lawmakers; the Prohibition Commissioner and his enforcement agents—all are there. Yet Washington is generally regarded as the wettest city in the country outside New York. With the greatest moral problem of a generation confronting the country, we enter the sixth year of prohibition with the examples of these wet Congressmen before us; a flagrant disregard of one law which tends to bring other laws into contempt.

The impartial enforcement of all law is becoming a national problem of the first magnitude.

The public's confusion of mind on the subject of prohibition is great enough, without having it made more chaotic by Congressmen who violate the Volstead Act.

Millions of individuals, for instance, undoubtedly believe that prohibition is a mere law of Congress, which should be repealed.

This brilliant suggestion has been dinned into their ears by candidates for Senatorships who would make their particular state "as wet as the Atlantic Ocean" and by governors who refuse to co-operate with Federal enforcement officers.

These uninformed people do not understand that if Congress should repeal the Volstead Act, it would be in duty bound to enact another law enforcing prohibition.

Nor do they understand why, if Congressmen break the law which they helped enact, the "man in the street" should not do likewise.

A man who will help to pass a prohibition law with one hand and drink with the other is beyond the ken of the average man.

Just as a chain is no stronger than its weakest link, so are prohibition enforcement units no stronger than the individual human links that go to make up the whole. And the majority of these have been recommended for appointment by Congressmen.

Are Congressmen who themselves wink at the Prohibition Law going to choose agents who will enforce that law?

A reversal of public opinion in favor of prohibition enforcement has in the last few months manifested itself. Ridicule of the liquor laws has disappeared from the majority of newspapers. And anti-prohibition jokes are seldom cracked on the stages of the better class of theaters. Public opinion has brought about these two reforms. If the proposed investigation of wet Congressmen who vote dry, however, is conducted in good faith, it may result in a house cleaning that will make it impossible for a member of Congress to drink either publicly or privately, and still hold his seat in the House of Representatives. If, however, it becomes nothing more nor less than a whitewashing affair, in which Congressmen are acquitted of all charges of tippling, many who are familiar with Washington life and the intricacies of Congress will probably laugh themselves to death.

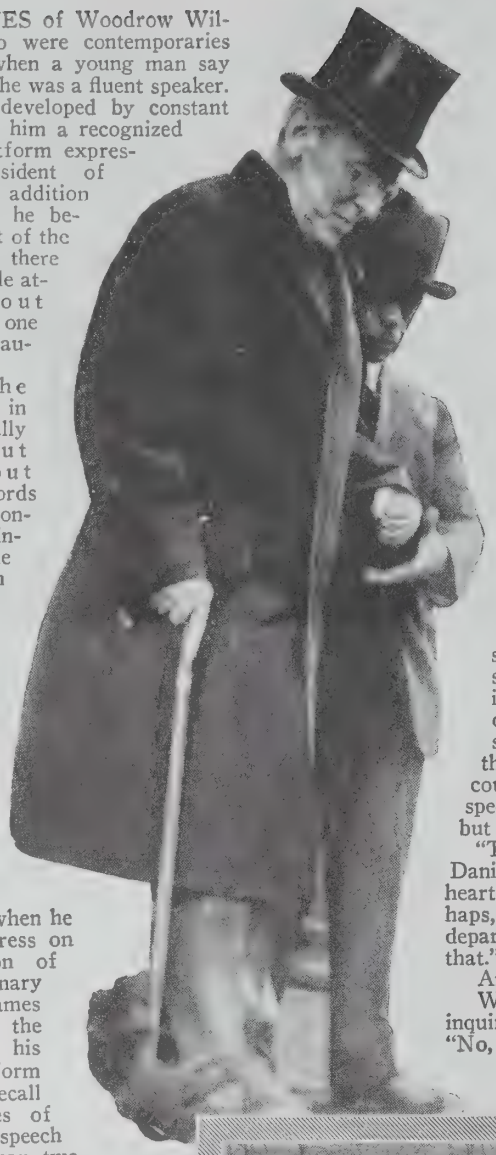
At the Close of the Day

"He Held On When There Was Nothing in Him," Except the Will to Do

By HUSTON THOMPSON

Copyright, 1924, by Huston Thompson. All rights reserved.

This is the third and last of a series of articles giving intimate glimpses of the life of Woodrow Wilson.



RELATIVES of Woodrow Wilson who were contemporaries of his when a young man say that even then he was a fluent speaker. This fluency, developed by constant practice, made him a recognized master of platform expression as president of Princeton. In addition to this, when he became President of the United States there was a noticeable atmosphere about him as of one speaking with authority.

Up to the World War in 1914, he usually spoke without manuscript, but when his words began to be considered and interpreted by the entire world in those perilous times, he resorted to written speech, a practice which he disliked very much. In the days before responsibility and fear of misinterpretation were upon him, as when he made the address on the celebration of the Tercentenary of the King James Version of the Bible, he put his speech in the form of notes. I recall that the notes of that particular speech covered less than two pages. On that occasion, I asked for copies of his speech, that they might be given to the press and in response to my request, he drew from his pocket two sheets of ordinary note paper with an outline sketched on them in pencil. On the opposite sides of these two pages were the notes for two other speeches.

This incident brought an inquiry from me as to his method of preparing his speeches, in answer to which he explained that in his youth, and until he became president of Princeton, it was his custom to write them out in full before delivering them, but that after he became the head of the university, his time was so occupied with other matters that he was forced to rely merely upon outlines. At the same time, he discovered that through the years of constant writing he had acquired a vocabulary such that if he had the outline clearly in his mind, he found no difficulty in dressing it up with suitable words.

One of his most noted speeches was made without the writing of a single word on paper in advance. It took place in the ballroom of the Willard Hotel in April, 1916. The occasion was a banquet given by the Common Council Club, a progressive organization of appointees under Wilson, together with Senators and Congressmen. His first administration was coming to a close, and, as the party conventions were soon to be held, the members of the club thought that a Jefferson Birthday celebration would supply a fitting opportunity for the President to voice his views on what the administration had done and to express in a general way the plans which it was developing and proposed to carry out in the future.

That evening, as President Wilson left the White House, he was followed to the door by one of his daughters who asked: "Father, what is the subject of your speech for tonight?" Taking her hands in his, he said: "I have no idea at this time, but I recall something that is more important to you. Tomorrow is your birthday and I want you to invite all of your friends in to dinner."

The Willard ballroom was crowded to capacity that night, but not when the President entered, punctual as usual. He arrived and took his place just as the crowd was beginning to filter in. Quizzical as to the many tables and few diners, he asked in a slightly annoyed way why they were late. Aside from this, President Wilson was in high spirits. The appearance of each well-known character or personage was the occasion for some humorous quip or story that kept those around him in gales of laughter. During the service of the course, he leaned over and said, as he did in Denver, back in 1913: "I am at a loss for a subject tonight. Can you give me a suggestion?" But this time there was no appearance of worry. He was more in the frame of mind of one who had many subjects to talk upon but was seeking aid in the choice of the most appropriate. This was the period of the administration when Secretary of the Navy Daniels was under fire from many sources. He had taken a decided stand on Prohibition on board our battleships and had also refused to accept the bids on steel armor plate because they were approximately identical. It occurred to me that some remarks in defense of his administration would be timely so I suggested Mr. Daniels as a subject, adding that, as the President knew the causes for the attacks, he could give the same considerable publicity in his speech. This suggestion appealed to him very strongly, but he replied:

"There is no one whom I would rather speak for than Daniels. He knows what I think of his work and how heartily I am behind him, so he is not worrying. Perhaps, however, this is not the occasion to discuss his department. I would like to take a whole evening for that."

And he did a short time after in that same ballroom.

When the speeches were about to begin, I ventured to inquire if he had yet selected his subject. He replied, "No, but I shall take my cue from the other speakers and shall undoubtedly get some suggestions from their addresses."

Only the slight drumming on the table and a fixed gaze over the heads of the diners in front of him gave any indication of his preoccupation. When Senator Glass, who had spoken on the Federal Reserve System, finished, the President remarked to those about him that it was a masterful presentation. Intervening between the last address and that of the President, was a number by the orchestra. During this interval, he said: "It is so difficult to make a speech where there is no opposition. Practically all of those here tonight are our friends." I replied: "But there are four or five million people scattered over this country who are not in accord with the Administration. Why not address your remarks to them?"

It was not a time when an attack, even if he had the desire to make one, would have been wise. He was doing his utmost to keep the nation neutral, and so, even though we were approaching a Presidential campaign, his attitude toward the opposition was one of gentle irony.

Throughout the whole speech there ran a very serious vein in which the background of the European conflagration and the danger that it might embroil us in it was the keynote. There was a moment in that speech that sent thrills up and down one's spine and held the banqueters spellbound until the final word and then brought them to their feet in a wild burst of applause. Pointing his inquiring forefinger at his audience, he said in slow measured tones:

> "God forbid that we should ever become directly or indirectly embroiled in quarrels not of our own choosing, and that do not affect what we feel responsible to defend; but if we should ever be drawn in, are you ready to go in only where the interests of America are coincident with the interests of mankind and to draw out the moment the interest centers in America, and is narrowed from the wide circle of humanity? Are you ready for the test? Have you the courage to go in? Have you the courage to come out according as the balance is disturbed or readjusted for the interests of humanity?"

President Wilson was not only keenly alive to the effects upon his audiences in his Washington days but as far back as when he was a professor in his lectures on Constitutional Law which were elected and attended by more students at Princeton than any other one subject. In those days, his manner of handling the subject aroused even the most critical, information-resisting students to spontaneous applause which would frequently interrupt him. Who could have so lacked humanness as not to have been pleased by the stamping and handclapping of students who crowded the largest lecture room on the campus? There can be no gainsaying the fact that it pleased Woodrow Wilson and the expression on his countenance revealed his pleasure. In response, he would pause with forefinger suspended in the air and with a slight smile playing around his eyes. When in this way he had acknowledged the compliment, down would drop the hand as a signal, and a serious expression from him would cut short the enthusiasm. Again one would hear in the silence the scratch of the pencils of his auditors as they continued to take down the lecture.

It was a part of Woodrow Wilson's Scotch reticence that made him shield his tender emotions from the public. Because he refused to wear his heart upon his sleeve and advertise the fact, his enemies sought to build up before the public a cold and calculating personality, while the proud Wilson disdained to let them know whether their outrageous attacks upon his character had hit the mark.

Even in Princeton days, Woodrow Wilson was able to hide his sufferings, though they may have been poignant. When he received the nomination for Governor of New Jersey, but was still at Princeton, many of his friends felt that he was entering a life for which he might be unsuited, where he would be subject to cross currents of attack and criticism that, despite his standing and character, would injure him and bring him down

to low estate. In this vein, I wrote him in September, 1910, expressing regret that he had taken this step. He replied that he would not have turned away from Princeton for anything which did not seem to him a superior duty. He was sure that if I could have seen or known the circumstances under which he received the nomination I would agree that it was a call from which he could not and should not escape. In closing the letter he said:

> "I hope that with all my heart, and believe, there is force enough in the Board of Trustees (of Princeton) to prevent any serious reaction of policy, but I must admit that I have spent a very unhappy life under the attacks which have been made upon me by some Princeton men."

There came a day when he was able to joke and laugh about the Princeton situation though he never did overcome what he thought was the injustice which he had received at the hands of those with whom he had been intimate for a long time. Some years after, at a dinner in the White House, which he was giving to the Supreme Court of the United States, the present conditions at Princeton and those at the time of his withdrawal became a matter of a few minutes' discussion between himself and Mr. Justice Pitney who was a classmate of Mr. Wilson's at Princeton. The ladies had withdrawn from the dining room and had crossed the White House to the East Room, leaving the men standing around in groups smoking and chatting. Mr. Wilson who was a reader of the Princeton *Alumni Weekly,* while in the White House, brought up the subject of an article that had appeared in the *Weekly* discussing the developing of the Quadrangle system on the campus, a thing which he had urged as a substitute for the social club system of Princeton. During the discussion, I recalled that it looked as if the college was coming around to the point of view that he had advocated as president of the university, when he said with a laugh:

"Well, then why did they kick me out?"

During his incumbency at the White House, many of Mr. Wilson's friends did not agree with the silence which he maintained in answer to the false stories that were spread about him, and thought that he ought to take the offensive such as Mr. Roosevelt did when he sued for libel, a party charging him with being given to drunkenness. But Mr. Wilson's attitude was expressed in the idea:

"What's the use? My friends don't believe them and my enemies won't believe me no matter what I say."

No matter how bitter his enemies in Washington were, they universally conceded that Woodrow Wilson had one virtue—a cold intellectual ability, if that may be called a virtue. Certainly Woodrow Wilson would not have considered it such. Perhaps that is why hostile partisans conceded this type of ability to him. Seldom if ever did one hear the opposition admit, even with reluctance, that this "man of mystery" was moved by generous impulse. In fact, those who were his friends were constantly combating attacks of this kind, and the writer was more than once challenged to name a single generous action on Mr. Wilson's part. A never-failing and unanswerable reply was the statement that Woodrow Wilson during his professorship at Princeton when living on a salary of $4,000 a year, and caring for a family of five, at the same time took into his home and sheltered, free of charge, for their four years' college course, a brother-in-law and a nephew, and at the same time kept open house for many relatives who frequently spent their vacations with him. If the facts could be measured, it is fair to say that no college professor ever gave more freely and with more joy and in greater abundance of what he had to those in need than did Woodrow Wilson. To meet the demands upon him he was compelled to add to his salary by writing constantly and lecturing on many occasions in addition to his college work. In Washington during the days when absorbed and weighed down with the war and world problems, and spending a great deal of time so that he would not say the wrong thing in the statements which he was making to the world, even his friends sometimes mistook his engrossed state of mind for coldness, yet during those days, his sick friends at the hospitals in Washington were receiving notes of cheer and flowers from him. The little boys and girls over in Virginia along the route to the golf course, who ran from their modest homes to greet him on his way to the game, were being individually remembered with Christmas presents. The wounded sailors and soldiers were being visited. Even the old man who sold fish to the White House was being looked after personally by the President when sick, and the many benevolences to which the White House checkbook responded were being taken care of with as much thought as ever. Yet all this was done secretly and with the sensitive reticence of Woodrow Wilson so that there were few persons in Washington who were acquainted with this side of his life.

Back in 1913, as his campaign train halted before a good-sized crowd gathered at the little station of Castle Rock, Colorado, he made a few remarks and was bade goodby with a cheer by the crowd.

As the train pulled out, I said, "Well, what do you think of your chances for election in November?"

"I am as good as elected already," he replied, "It is only a question of the number of votes."

The lack of spirit in his voice as he made this remark caused me to comment on it, to which he answered as a serious look swept over his face:

"I know I ought to meet this great honor that is coming to me with delight, but somehow, I see over the horizon a black cloud that gives me an ominous feeling which, try as I may, I cannot dispel."

Superstitious persons might have been troubled over an incident which occurred to Woodrow Wilson on the morning of his second inaugural. As no newspapermen were about and as the incident apparently made little or no impression on Mr. Wilson and those about him, it seems never to have reached the public press.

The hour had arrived for him to proceed to the Capitol from the White House. Just as he passed out of the north gate accompanied by Mrs. Wilson and Dr. Grayson, in an equipage drawn by two magnificent black horses, the horses slipped on the pavement and fell to the ground. The writer was standing a short distance away when it happened. The only impression at the moment was that this was an embarrassing occurrence, but a woman close by said in a suppressed scream:

"Oh, bad luck! bad luck!"

Then it was that the incident at Castle Rock, Colorado, was brought to my mind, but almost immediately dispelled. With the assistance of Dr. Grayson, the footman and driver got the horses on their feet again, and had the carriage moving in a few minutes, while the President and Mrs. Wilson looked on calmly and silently, except for an anxious inquiry as to how the horses had fared.

So far as my conscious mind was concerned after this incident, the remark made at the little station in Colorado was gone completely. But when the news was flashed across the country that Woodrow Wilson had been stricken on his train and would not be able to respond to an address which he was to make on the League of Nations at Wichita, Kansas, on the twenty-sixth day of September, 1919, then the forgotten remark made in Colorado, coupled with the tragic news of his being stricken down, either in Colorado or just as he crossed the border line into Kansas, came back.

Following the funeral of the Unknown Soldier

It set me to wondering whether his remark of those earlier days was portentous of a cloud of hate that was to gather above him and hurl its bolt upon his wearied brain in that same part of our country, or whether it was the World War cloud that gathered in 1914, or was it simply the thought of what the Presidency must bring to one when he realized that he was about to occupy that position. Whatever it was, Woodrow Wilson had gone ahead regardless of the cloud on the horizon or the many storm clouds that gathered during his eventful career. True to the philosophy of Kipling's "If," having passed through the war to peace time, he had dared to make a great solemn referendum of his League of Nations to 110,000,000 persons. All his life, he had loved a contest with the opposition. Now he met it. In all its strength it was comparable to none that was ever before faced by a President. To the opposition was added a withering wave of personal hate.

Opposition in the form of conscientious difference of belief on a debatable question he welcomed, but hate hurt him, just as it had done in the fight at Princeton, and undoubtedly this was the accelerating cause of striking him down when his heart broke during the tour across the country in behalf of the League. Again in the words of Kipling, he had forced his "heart and nerves and sinew to serve" their turn long after they could respond. Even as a casualty of the war, "he held on when there was nothing in him," except the will which said to him "Hold on!"

Probably no one who stood and witnessed his last public appearance at his home on Armistice Day, November 11, 1923, had fully sensed his "will to hold on" to a cause when all else but the will had fled. Had those in charge of the event been aware of how terribly Woodrow Wilson had failed in the preceding month, they would never have invited him to put himself to such a test. With feet so swollen that they had to be incased in shoes whose cloth uppers were held together by strings in overcatches, with countenance so swollen that his smile could not express itself beyond his eyes, he nevertheless, with the assistance of a servant, slowly made his way out on the porch and gazed at the ten thousand or more who had gathered to hear him. This demonstration of loyalty, and particularly the view of the armless, legless and sightless veterans from the hospitals surrounding the doorway and within a few feet of him, moved him to tears. When silence was obtained, in low, husky, broken words, he almost whispered his thanks for the reception accorded to him, and then paid a compliment to General Pershing, whom he said was the real Commander-in-Chief of the Army.

In the middle of his speech, he halted as if to get his breath and said to me, "I can't go on"; but his will said "go on!" And he gathered the remnant of energy left in him and finished his remarks.

With the aid of his servant he turned and started to hobble slowly into the house.

It had been agreed that the moment his address was over, I was to signal to the band leader to start the music. With a lively air, the band had begun when Woodrow Wilson, who was just inside the door, slowly turned again and made some remarks.

His voice was so low that I could not hear until my ear was close to his lips. Finally I caught the words, "Stop the band, I have something more to say."

Again he struggled to the front step and in trembling, faltering tones he uttered his last public challenge to those who were opposing the League of Nations, and said, in weaker tones, "That is all." Then he passed forever from public view.

Training Youth in the Good Old Days

Son of the House Had Strenuous Time When Washington Was a Boy

By CHARLES J. FINGER

THE other day a well-meaning, but sadly misinformed old gentleman entered a vehement protest against what he was pleased to style "the artificiality of the present generation," and in the course of his dissertation ventured a prophecy that the day would come when we would gladly return to the simpler and easier manners of a past generation, a time when, as he held, the young conducted themselves "humanly and sensibly." Social veneer, he said, was a modern and detestable thing and the delightful and refined etiquette of the days of Noah Webster a something most heartily to be desired. Confronted with the statement that Noah Webster's moral lessons inculcated a kind of savagery, especially when praising philosophic farmers who, finding argument with apple-pilfering boys was of small avail, decided to try "what virtue lay in stones," the old gentleman grew restive. Speaking quite sharply, he assured his hearers that he could conceive of nothing more elevating than the juvenile literature of the past, but he was not explicit as to any particular period.

Now stupid and prejudiced old gentlemen are hard to convince, and the opinionated fellow refused to see good in "Alice in Wonderland," the Oz books, Miss Alcott, or anything of the kind, so neither of us got beyond assertion. But having read voluminously and unwisely all my life, I could not see the man's point at all. I recalled pages reeking with bloody daggers and the shrieks and the groans of melancholy specters, of dark and dreadful deeds done in caverns and barns, of secret rooms and trapdoors and gloomy halls, of reptile-infested caves, of haunted graveyards and blasted trees. And though those were for children of older growth, there were other things written, apparently with no other view than to awaken thrilling horror. I remember once being hailed in an eager and light-hearted way by an estimable great-aunt, a guileless old lady, very charming and attractive and genial, who felt moved to read to me a story from some juvenile magazine of her day. It was all about a girl, whose mother, wishing to convince the child of six years of age that life was uncertain, sent her into the churchyard with instructions to measure the little graves. Page after page was devoted to Bessie's reflections, and at the end, the child indulged in superhuman soliloquy somewhat in this fashion:

"Mother says that many children die before they are as old as I am, and I see that she is right. My string tells me that. How odd that I never brought a string to measure graves before. But here is another little stone with pretty verses on it. I must read them:

"'Two little babes this death-bed share;
However young, prepare, prepare.'"

I find something of the same tenor in the New England Primer (second edition, Boston, 1691). Apparently children of the day were expected to go about in a mood of broken-hearted solemnity, courting, as it were, the shadow of grief. To quote:

"In the burying ground I see
Graves shorter there than I;
From Death's arrest no age is free,
Young children, too, must die.
My God, may such an awful sight,
Awakening be to me,
Oh, that by early grace I might
For Death prepared be."

As for those simpler manners of a past generation, I turn for specimen to a book entitled, "How the Young Should Act," originally published in Boston, the year not given, but apparently embodying, or bringing up to date, certain "Rules of Good Manners" from some earlier work. Polite conduct in the days when Washington was a child would seem to have been a wholly unlovely and affected affair. From the section devoted to "Conduct when a Good Visitor Comes," I cull this:

1. You should not read when a Grown up person is in the Room, for that is not proper. When Mature Persons talk they give forth Wisdom and the Proper Youth must hearken with a lively ear, not looking in the Person's Face, but with folded hands, being Discreet, for thus the Person will feel Interesting and so talk more.

The better to provoke a burst of awe-inspiring oratory, the Proper Youth is instructed in the Manner of Standing.

2. When a Person visits the House, the Boy of the House should stand before the person in an easy manner, with one Hand in the Breast of his Waistcoat and the other under the Flap thereof.

Admiring the pony.

3. If the Visiting Person moveth, the Son of the House should push his chair after Him that he may at any time sit down.

Apparently, for the Son of the House the coming of a Good Visitor was a fundamentally serious social function, and there must have been moments of bewilderment when two or three restless and excited guests got to their feet, resolved in the heat of political argument to struggle on in feebleness rather than collapse in despair.

But it was at the table that the highly trained and attentive boy had his trials. To get through a meal successfully must have been a hard-earned and well-deserved triumph, especially in the deplorable combination of a hungry boy and an absent-minded host.

"The Model Youth must at all times say 'No' when asked to partake of a Nice Thing, especially if there be not much. Nor is he at any time to ask the price of the Dainties. Nor should he laugh or smile or feel amused when something should perchance happen to the discomfort of the Host or his Consort. Neither shall he drink from the Milk Jug, nor, standing upon his Chair reach across the Table, lest he be counted Ill bred. If he wish a serving from a Dish, he shall not stamp nor whistle, but shall look thoughtfully upward until, perchance, the Master of the House hitteth upon the Desired Thing. Also must he beware how he handle the Food, lest the Sweet Things or Jambs smear his Countenance."

From the context, it would seem that the Youth was left at the table when the elders withdrew, a happy provision in the case of an inattentive host and a boy with an appetite. For instructions follow, advising the boy as to his behavior when "The Company removes itself from the Board and becomes Disposed to Thought."

"The Boy must quietly enter the Room where the Grown People are disposed, not looking merry or amused, lest the Host be not pleased after the Meal."

Is dyspepsia hinted at?

"The Boy must not sit by his sister, but rather speak modestly to the Daughter of the House, or, should she be in no mood of the kind (!) then shall the Boy stand in some corner in contemplation and meditation.

"A Good Girl must not laugh nor speak until she is spoken to. She must neatly arrange her Frock and look before Her or at the Carpet, not seeming to be eager of the Conversation of the grown-up Persons. Let her at all times watch that her smile be pleasant, and if the Host say something to her she should say sweetly, 'Yes, kind Sir,' or 'No, kind sir,' and courtsey, prettily. Perhaps the Master of the House will ask you to recite something from the poets, or Dryden, which soundeth well at all times."

The Grown People were given every opportunity to score off the children, apparently, for the Boy also had to offer himself as candidate for the intellectual bear-baiting.

"When the Master of the House inquires into the Studies of the Boy, the Proper Youth should offer with willingness but not too trippingly, to work out some Arithmetick question that the Master may propound, or on occasion to recite his last Lesson. But he should at all times speak well of the Schoolmaster.

"In the Drawing Room no Good Boy or Girl should finger the books that be Layed so evenly on the Table, for your Good Hostess hath put them thus and so to the end that they may please the Eye. Neither should you praise the Things that you have at Home, but speaking of them, decide that they are Inferior, for thus the Hostess will be the more pleased with that she owns."

Taking it all in all, the Model Boy would seem to be heavily preoccupied, but the Grown People satisfied, or bored, there was a new campaign, this time in the shape of an exasperating ritual to be observed and carried on with hectic energy.

"The Visiting Boy shall admire the Structure of the House and shall praise the Flower Beds. It is also seemly for him to ask that he may pluck a Rose to bear to the Master of the House.

"If the Boy of the House hath a Pony or a Dog, the Visiting Boy shall ask him to ride it (!) Meanwhile the Visiting Boy shall run by its side and speak kind words of the animal, or admire the Furnishings, and when the Boy of the House hath shown the merits of the animal, the Visiting Boy must doff his cap and thanking him, bow."

So, after a day of miserable discomfort and ignominy comes the moment of farewell and the final curtain. All the incense of flattery has been burned and all the little monkey tricks have been performed, but one little conventionality remains to be attended to. The struggles, the efforts, must be approved or disapproved at the house door, though again the Boy runs the risk of a flood of oratory.

"If the Youth hath done all well and brightly and be not at the end thrust aside by his Parents, the Good Host may be so well pleased that on leaving he may hand the Boy a bright new Penny. If this be, and the Host inquires, as he well may, what the Boy propose to do with the Gift, he shall answer that it is to go to the Poor, or some such thing. Thus will be well pleased your Host and Entertainer.

"So all will fall out well except your Behaviour was not what it should have been, for the Cloud will gather when you are again at your home. For a Wise King said Spare the Rod and Spoil the Child.

"But if all was well and proper, then at the Door the Master of the House may smile and lay his hand on the 'Youth's head, at which the Boy shall say these words, 'Kind sir, I thank you, and your generous house shall be well remembered,' or some other pleasant speech that your Parents or Schoolmaster may teach."

The following letter from a son to his father, dated December 6, 1787, so delightful in its simplicity, may form an appropriate conclusion:

Honored Father,

As I have no letter from you since your favour of the 8th of October last, which I answered by the next post, I take this opportunity of enquiring after your health, and that of my sister: I have herewith sent you, Sir, by Samuel Simple, the Pempsey carrier, a spaniel dog, called Tray, who is an excellent good one of his kind, and fit for the sport of your place; he is very free for the water; and if he hath any fault, it is being a little too eager; but he is young and may be brought to what you please to have him. Pray give my love to my sister, and be pleased to accept of my duty to yourself, who am,

Sir, Your most dutiful Son,
and humble servant,
Anthony Addlehill.

If the Visiting Person moveth the son of the House shall push his chair after Him.

Mr. Ford's Page

THE strength of any country is the stake which its citizens have in it. A nation of tenants is an unstable mass. People who are only renting the right to live in the land are not likely to care greatly what principles rise and what fall at the hands of government. And governments who rule over a nation of citizens thus loosely attached are under less compulsion to care for the deeper public rights.

Tenant nations exist as the result of one of two causes—an initial inability to secure land, or a later inability to hold land because of high taxation. We have examples of the first throughout Europe, where in many countries the land was early taken by the nobility and held by them for centuries, the people, whether in city or country, being but tenants. It is hardly necessary to say that in those countries there has been ceaseless trouble, a growing division between government and people, an enmity between classes of the people themselves, and eventual downfall.

It is worthy of note that the revolutions which have occurred in the last twenty-five years have all used the land question as their chief lever. They have appealed to the land-hunger of the landless peasants by promising them a division of the nobility's estates when the new government should have been established, but they have created the confusion and chaos indispensable to a revolution by seizing such privately owned land as existed. The destruction of ownership on the one hand, combined with the promise of ownership on the other, but always involving in some way the matter of ownership, has come to the fore in every revolutionary activity. Revolutions do not and cannot occur where the people are owners of their own country.

The United States began with the greatest political and economic capital possible to any nation—men and land. The system of aristocratic ownership had no opportunity here at the beginning, the very bigness of the country discouraged it. Wherever the leading colonists tried to make themselves great landlords as the nobility of Europe had done, they thereby simply created a pressure which drove people farther toward the frontiers, to occupy the vast spaces which no amount of greed could control.

It was the possibility of people becoming part owners of the country that drew to us the great constructive tides of immigration that marked the earlier stages of our growth. People came from all parts of the earth because they could own a stake in the country. They could buy and work and hold in perfect security all the land they needed. The United States was a country where every man could sit under his own vine and fig tree, none daring to make him afraid.

That was our glory up to a short time ago. Our country was safe, because our citizens had their own property. Our country was conservative, because ownership begets a sense of responsibility. Our country was constructive and progressive because property must be used and developed to prevent it becoming a liability instead of an asset.

There were cities in this land that prided themselves on being "cities of homes." They were built up, lot by lot, by the home-building and home-owning instincts of the people. Homes brought industry, and industry brought more homes, and both together built up great centers of life. The people were interested in the quality and actions of government, because these had a direct effect upon the welfare of the home. Voters were owners, not merely tenants, and what they said had an air of authority about it. They were speaking from their own stake in the state, as partners in the business of government. The soundest communities were those in which the largest proportion of people lived on their own plot of land, though it were but a 30-foot lot in the city.

Few will deny that a change has come, and few will have any doubt as to its cause. The proportion of owners is decreasing. And the ratio of their decrease is the ratio of tax increase. It is time for our statesmen to begin to think about the widespread *discouragement of ownership* which overtaxation has brought about.

When men find it cheaper to rent homes than to own them, when the pressure of taxation becomes so great that it requires building and real estate corporations to meet it, when young married couples find detached homes impossible and must resort to a modern form of cliff dwelling, when ownership moves away from individuals and becomes more and more centered in syndicates, then a change is coming over the United States that is un-American. And if it is our system of taxation that is at the bottom of it, then our taxation is un-American. Any system which taxes the American citizen out of ownership into tenancy cannot by any stretch of loyalty be termed American. And any endeavor to remedy such a state of affairs in the interest of restoring widespread ownership to citizens cannot by any stretch of imagination be described as un-American.

ONCE in this country the plan was tried of taxing men out of their rights. Opposition to that was one of the causes that made us a nation. "No taxation without representation" said the first Americans. Now, however, we have seen taxation grow so large under representative government as to affect the stake in the land which every citizen would have if he could. Taxation has reached a point which makes difficult if not impossible small ownership where it has not yet been attained, and discourages it where it has. Any system that taxes citizens out of ownership into tenancy, that makes it easy to rent one's place in the nation and hard to own it under the security of law, is a bad system, and undermines the nation more than any destructive political teaching could. The homes of a people are the country's strength, not its tenements. This view of taxation merits attention.

The problem of taxes is not their *amount,* but their *effect.* The present system of taxation has been justified to the small owner because it has seemed to lay the burden on the large owner; but the *effect* of such taxation is to drive out the small owner and compel the large owner to become larger as a measure of self-protection. This only needs to be stated to have its dangerous character made clear.

What has been said as relating to the home owner who finds it as burdensome to own as to rent, or as relating to the tenant who finds it less burdensome to be tenant than master, also relates to business. The ownership of business is being made in some cases an impossibility by taxation. The legitimate motives to exertion have been neutralized, the legitimate necessity of expansion has been penalized, the whole drive toward initiative and excellency has been devitalized by the endless variety of tax charges that come from every direction and from every unit of political power.

The result is a socialization of all industrial effort without the social benefits which socialism promised. The beneficiary is the Government, and the beneficiary of the Government is largely itself. Government has usurped the place that was once supposed to be held by what was called the "capitalistic class," but whereas that class was compelled to keep its money in productive industry, and at least had its money invested where other people could use it and do things with it, the Government simply absorbs and goes on absorbing. If so-called "capitalism" had ever absorbed the fruits of industry to the same extent that taxes absorb them, it is impossible to say what would have occurred. What is occurring now is that taxation is discouraging effort, for men will probably never learn to find satisfaction in earning vast amounts for the purposes of paying taxes. If they could see any proportionate results from their payments, if they could see that money put into Government served as great a public benefit as money put into industry, they might be more satisfied; but that is a sight that no one has yet seen, and no Government has ever been bold enough to make the claim.

Again, it is not the *amount* of taxes that must be paid that causes the discussion, it is the *effect* it has in destroying the very tax sources. Living in a country like this is worth all it costs, with a lot more thrown in for good measure, but when the cost eats up the benefit, there is something fundamentally wrong—and the suspicion grows that it is the *system* that is wrong. Any system that turns free America into an unfree America is certainly wrong.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The New Secretary, Dr. Jardine

DR. WILLIAM M. JARDINE comes from the right state and probably from the right training to give him the elementary equipment necessary to the making of a good Secretary of Agriculture. The report that he owes his appointment to another, not the President, renders it advisable that he administer his office in such a manner as to leave no doubt that he alone is the Secretary of Agriculture.

Probably at no time since this Cabinet position was created has it been so important as it is today. It is not anywhere believed that the Secretary of Agriculture can become a Moses to lead farmers out of their wilderness of difficulty; but he has a tremendous opportunity to protect the farmer from continued victimization by false ideas of agricultural salvation. The farmer has suffered as much, in some cases more, from his confidence in remedies that did not cure, than from the ailments themselves.

Ever since the sparsely attended agricultural conference at Washington, when President Coolidge was prevailed upon to make an address, there has been a concerted program of propaganda, including even the city newspapers in its scope, to make the term "Co-operation" synonymous with an expensive agricultural patent remedy which has never cured anything, but has aggravated every condition it has touched. President Coolidge's speech was made coincident with an attack on THE DEARBORN INDEPENDENT, which in turn was followed by the publicity program which plainly sought to identify Co-operation with Sapiroism.

We have no means of knowing whether Dr. Jardine has taken sides on this question. As Secretary of Agriculture he will have to decide whether Co-operation is to be preached as meaning Sapiroism, or as a method of organized self-help which is as yet very far from having reached its best form. Co-operation itself, as a principle, does not need to be preached. Have not the farmers for years tumbled into everything that has borne that label? Have they not contributed their money and their loyalty without stint? But their experiences have been such as to make them begin to suspect the very name, so often has their confidence been abused. A distinction between false and true Co-operation is necessary.

It is sincerely to be hoped that the new Secretary of Agriculture will undertake a definite educational work to inform the farmer that not every movement that steals the name "Co-operation" is necessarily that, but may be something vastly different.

Whatever happens, the Department of Agriculture will have a larger observing public than it has ever had before. Events and tendencies have thrown it into the first rank in public interest, and its administration will be carefully scrutinized with all good wishes for its wise guidance.

The Air Question

THE aircraft controversy is most unfortunate. It has taken a turn which may prejudice the flying art, unless cool common sense takes the helm. The contest contains far too many personal elements, and the early stages of the investigation have not done much to clear up the situation. The question does not center where the zealots would have it center; the main question is not the independence or subordination of any department, but the best defense of the United States. The effort for an independent department will probably be lost at this time, because independence comes by desert not by decree. Are cavalry, artillery, engineering, independent of the Army? They are parts of the Army. If the Army needs airmen, as it does, are they part of the Army? If the Navy needs airmen, as it does, are they part of the Navy? Is not naval knowledge, experience and direction essential to a Navy airman?

A serious mistake has been made by precipitating the question, in just this form, at the present time. There were other matters to resolve first. Beyond question the airmen deserve more support than they have received from Congress. They have been compelled to work with obsolete material. Engaged in extra hazardous work, as all experimental work in the air must necessarily be, the hazards have not been recognized in their compensation. Scores of our best men have been drawn out of the service by the necessity of earning more money. Here were points to work upon, definite and practicable improvements to be made, actual advances to be won.

Instead of that there was heaped on the country the nonsensical charge that both Navy and Army were jealous of the Air service. A charge of jealousy is too often the product of exaggerated ambition in another direction. Our own inquiry among Army and Navy men indicates that this "jealousy" is a figment of imagination. If the Air service were all that its spokesmen claim for it, departmental independence would be the only status it could have; it would just naturally arrive there. It could no more be held under other jurisdiction than the Navy could be held under the Army. The whole question has hopped off on the wrong principle.

It is proper to suggest that when the investigating committee have determined the question of separate jurisdiction, they will not stop there, but go on and recommend obviously needed improvement in the status of the flyers.

A Labor Shortage?

THAT there may likely be a labor shortage in 1925 is the prediction made by one of the business statisticians. If it occurs, it will be interesting. We have frequently seen in this country the spectacle of more men than work. It has been said that our normal situation is 10 per cent more men than jobs. Industrial slave drivers approve of that condition because, they say, it holds men more attentively to their jobs. Right *there* is the problem of Labor and Capital, so-called: the driving boss and the worker who won't go unless he is driven. If both could be bundled up together and dropped off somewhere, the whole industrial situation would be much improved, and much class rancor would abate. Anyone who has seen both ends of the quarrel will agree with that. All the same, if a labor shortage comes, it will be interesting to see what pressure it will exert in the way of improvement. It may serve just to give the whole problem that trifling shift of emphasis that will set the whole line straight for a happy and practicable solution.

The Lion's Cubs

CANADA has now given her answer to Britain on the Geneva Peace Protocol. It is to the effect that she will not accept it in its present form. The position of Canada seems to be that the Protocol leaves the way open for one country's interference in the domestic affairs of another. In this attitude Canada aligns herself with Australia, New Zealand and South Africa. The Japanese amendment, which opens the way to the review of questions arising out of the immigration policy of various countries, is an especial cause of disagreement.

The Protocol is really a war protocol leaving it with an international committee at Geneva to order a member of the League of Nations to resist or attack any recalcitrant member.

It is thus that "the lion's cubs" define a policy which represents the judgment of the whole Empire. Instead of London announcing the policy, it comes from the various British dominions. It must not be forgotten that the term "British Colonies" has become almost obsolete. The "Commonwealth of Australia," the "Dominion of Canada," and the "Union of South Africa" are now familiar terms, and the "British Commonwealth of Nations" is a phrase which is generally applied to the collective whole. It was a foregone conclusion that no British nation would consent to put the British fleet at the command of an international committee whose members largely represent alien culture. The Geneva Peace Protocol came nearer giving the color of a "superstate" to the League than has any other proposal. Certainly the United States, were it a member, would not accept it. A few similar proposals and rejections will do more to injure the status of the League than any attack that could be made upon it.

Canada's peremptory rejection of Japan's claim that the barring of immigrants may be considered an act of aggression shows very clearly that our northern neighbor is alert to the problem of selecting future populations. Canada's opinion is American and sound.

Straight Roads vs. Crooked

THE straight road against the curved road, as a promoter of accidents, has been brought to the front again by a report of the North Shore Motor Club of Wisconsin which shows that of the 2,981 road accidents in that State last year, 2,044 occurred on straight roads, while curves, hills, railway crossings and other danger points were responsible for but 937 accidents. The conclusion drawn by the makers of the report is that a straight road invites to speeding while curved or hilly roads invite to caution.

This is an interesting contribution to a discussion which will gather importance with the years. Already the "staggered" railroad crossing has been pretty well advertised in the public mind. This is a type of crossing which angles in one direction to give a driver a view down the railroad track, and then angles in the opposite direction to permit the opposite view, before the crossing is made; the two turns having the additional effect of slowing up the speed at a point of possible danger.

It is an augury of the sane and safe solution of the growing traffic problems that so many minds are at work upon it.

Concerning Old Masters

SOME months ago an exhibition was held in London, England, which had for its object the enlightenment of those who have been the victims of "fake art." From a very early period unscrupulous and ignorant dealers have been in the habit of palming off on unsuspecting persons alleged old masters and "antiques" of all descriptions. Some people have even bought and sold their "ancestors" in this manner, with their eyes open and as willing accomplices of the dealer in fakes.

Recently there has been brought to this country quite a large number of old masters, including a magnificent Titian. There is no reason to believe that these are not genuine; but it should be remembered that there are old masters and old masters. Take Rubens, for example; he conducted a large and well-equipped school of painting, and this was attended by hundreds of pupils, and these hundreds of pupils painted hundreds of pictures. The best of these pictures received their finishing touches from the master himself and were signed with his name, and have been accepted ever since as genuine Rubens'. The practice of touching up and endorsing the works of pupils in this manner was common in those days, and was considered legitimate. Though Rubens had lived to the age of Methuselah he could not have painted all the pictures that are placed to his credit.

But there is another source from which so-called old masters originate, and it is here that the art faker comes in. Art students throughout the galleries of Europe copy the works of the old masters, and some do it so well that it takes an expert to tell them from the original. Even some experts are deceived when the faker, by means best known to himself, has imparted to the copies the mellow tone and coating of minutely cracked varnish which distinguishes some genuine masterpieces. The only safeguard against this for the genuine lover of art who wishes to procure a genuine picture is to buy nothing of the kind until it has been examined and certified by one whose judgment is above suspicion.

Human

WHAT a human lot of people we are after all. When the Alaska settlement had diphtheria, and Floyd Collins was pinioned in his cave, and some poor people sat up all night waiting for the world to end, and Alice Longworth had a daughter—they became for a time our chief national interests. A cave in a little-known community of Kentucky became through human sympathy the focus of the nation's attention—for which Washington must have been glad, in a way; it turned off some of the scrutiny. These are but a few of the hundreds of thousands of poignant incidents that transpire every hour in this favored land; they would be scarcely recognizable even by the eyes of immediate interest in the uncountable millions of intense occurrences during any twenty-four hours throughout the globe. Life, even as we see its restlessness in the atom, is an intense thing. Fortunately for the human race the life immediately below us is hidden from all but the microscopist, and the life above is hidden from all but the contemplative. If we knew the living world beneath and the living worlds above, our present life would become almost impossible. Our sympathies and understanding have not yet stretched to cover the life that is within our ken. It seems to be the function of experience to deepen our understanding and broaden our sympathy—which means to enlarge our life.

Leaves From Naval Log Books

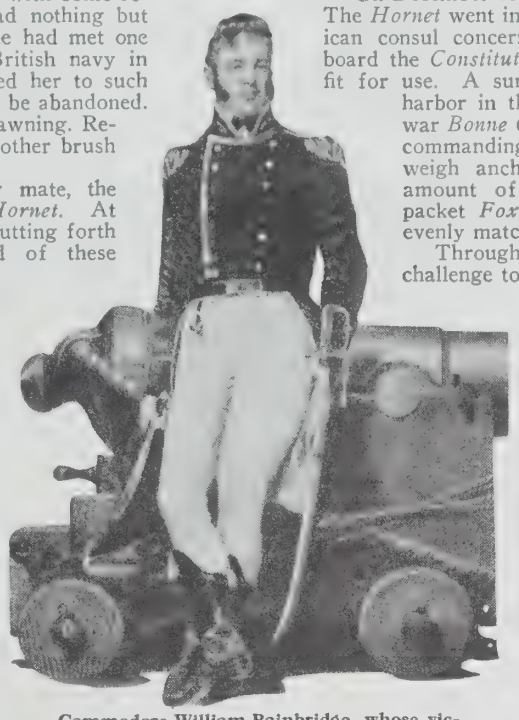
The Great Victories of the *Constitution* and the *Hornet*

By WILLIAM JOHNSTON MADDOX

Captain James Lawrence, victor in the 11-minute action of the *Hornet* and the *Peacock*.

LATE one afternoon toward the close of October, 1812, two ships, American by their trim, smart appearance, dropped cautiously down Boston Harbor, and, as dusk closed in, stood out to sea. For the moment the British patrol had relaxed its watch. The larger was a frigate of 44 guns, the *Constitution,* a name that was beginning to be spoken with some respect in Europe. They had had nothing but ridicule for her before. But she had met one of the crack frigates of the British navy in August and in fair fight reduced her to such a worthless hulk that she had to be abandoned. The heyday of her glory was dawning. Refitted, she was now ready for another brush with the enemy.

Her consort was a worthy mate, the saucy 18-gun sloop of war *Hornet.* At about the same time there was putting forth from the Delaware the third of these doughty musketeers of the sea, the light frigate *Essex* of 32 guns. They were bound for a cruise in the Indian Ocean to harass British shipping. A rendezvous had been appointed in the South Atlantic for their meeting. Great things were expected, from Commodore William Bainbridge on the quarterdeck of the *Constitution* down to little 11-year-old Midshipman David Glasgow Farragut of the *Essex.* It was a way these ships had. Wherever they went action was sure to follow.



Commodore William Bainbridge, whose victory over the *Java* added another glorious tradition to the history of *Old Ironsides.*

Destiny was to play a queer turn to the expedition. None was to reach the Indian Ocean. But for each was reserved a gallant, memorable achievement—not in company as they had expected to cruise, but separately, each for himself and in his own way.

The broad pennant of Commodore Bainbridge had been hoisted on the *Constitution* little more than a month before, when she returned fresh from her victory over the *Guerriere.* Isaac Hull, the hero, had believed there was glory enough for all, and had generously relinquished a command that he might have kept at a word.

Among the crew there had been some little grumbling at the change. But Bainbridge was an officer of high reputation and ability. He had served with distinction in the wars against the Barbary States, suffering captivity when his ship, the frigate *Philadelphia,* went aground in the harbor of Tripoli. In command of the *Hornet* was the chivalrous James Lawrence, who was later to be sacrificed in the wretched misadventure of the *Chesapeake.* One of Bainbridge's companions in captivity, David Porter, a capable and daring officer, commanded the *Essex.*

Disguised as British warships, the *Constitution* and the *Hornet* touched at the first rendezvous, Porto Praya in the Cape Verde Islands. Hearing nothing of the *Essex,* they proceeded to the second place of meeting, the Island of Fernando de Noronha, off the coast of Brazil. To the Portuguese governor his two visitors were the British frigate *Acasta* and the sloop of war *Morgiana,* and he graciously agreed to hold a letter, which Bainbridge intrusted to him, addressed to Sir James Yeo of the frigate *Southampton.* It read innocently enough:

"My dear Mediterranean friend, probably you may stop here. Don't attempt to water; it is attended with too much difficulty. I learned before I left England that you were bound for the Brazil coast; if so, we may meet and converse on our old affairs of captivity. Recollect our secret in those times? Your friend of His Majesty's ship *Acasta,* Kerr."

In sympathetic ink, however, it contained these orders for the private eye of Porter:

"I am bound off Bahia, thence off Cape Frio, where I intend to cruise until the 1st of January. Go off Cape Frio, to the northward of Rio de Janeiro and keep a look out for me. Your friend."

On December 13, the two ships arrived off Bahia. The *Hornet* went in to communicate with the American consul concerning fresh supplies. Those on board the *Constitution* had been condemned as unfit for use. A surprise awaited Lawrence in the harbor in the form of the British sloop of war *Bonne Citoyonne,* 18 guns, Captain Green commanding. She was just about ready to weigh anchor for England with a large amount of specie, in company with the packet *Fox.* The two sloops were about evenly matched.

Through the consul, Lawrence sent a challenge to Green inviting him to a meeting outside the three-mile limit, with the *Constitution* pledged to keep hands off. To show his good faith Bainbridge hauled off to sea thirty miles so that the two little fighters could have the ring all to themselves.

But Green declined. He distrusted the big frigate. The British press at home, when it learned of his refusal, was bitter in its criticism of him. The calmer judgment, though, has sided with Green on the ground that an officer's chief duty is to discharge his mission. At all events Green had the courage to maintain his attitude in spite of the repeated letters sent in by Lawrence. And for the time being at least he decided to stay where he was and leave the American to bite his nails outside the harbor.

Leaving the *Hornet* to watch over the English treasure ship, Bainbridge moved southward along the coast.

The weather was pleasant, with light winds from the east-north-east and little sea. On the morning of the twenty-ninth, the *Constitution* was proceeding easily about ten leagues offshore. At 9 o'clock, being in latitude 13° 6′ S., and longitude 31° W., two sails were sighted inshore and to windward. The smaller vessel went farther in, while the larger, altering her course, stood out toward the *Constitution,* which tacked to close with her.

The sinking of the *Peacock* by the *Hornet* was one of the hottest sloop actions of the war. In eleven minutes she was in a helpless condition. Striking her colors, she hoisted them again with the ensign down as a signal of distress.

For two hours they drew slowly nearer each other, when at 11 o'clock the stranger was discerned to be an English frigate. Bainbridge tacked again to the southward and eastward to draw her off the land, which was plainly in sight. By meridian he had enticed her far enough out to suit him and he broke out the Stars and Stripes at the peak and main, with a jack at the fore. Almost immediately an English ensign was run up on the other ship. She was the frigate *Java,* 38 guns, Captain Henry Lambert commanding.

At 1:20 Bainbridge tacked toward the enemy, who was a mile distant to windward on his quarter. Both ships headed southward and eastward. Then the Englishman did something that mystified the American. He hauled down his ensign, leaving only a jack flying. Bainbridge sent a shot across his bow to make him show his colors again. But the *Java* replied with a vicious broadside. It was 2 o'clock. Ten minutes later the action had become general with heavy cannonading on both sides.

The light winds favored the *Java,* which had the advantage of the windward position. Lambert used it now to keep away, for Bainbridge showed a desire to close. At 2:25 the ships passed on opposite tacks. As they did so a shot carried away the *Constitution's* wheel. A small copper bolt from the flying debris lodged in Bainbridge's thigh. It was his second wound of the day. The first was a musket ball in the hip. But he refused to leave the deck.

The loss of the wheel was a serious blow. As it was, the *Java* had proved herself the better sailer in the light wind, and Lambert was handling her with great skill. To have to resort to the tiller, which was worked two decks below by means of tackles, left the *Constitution* almost as awkward as if she had been stricken blind. All orders had to be relayed from the quarterdeck along a line of midshipmen. The maneuvers that followed reflect great credit on the men who handled her.

Aware of the mishap to the *Constitution,* the *Java* forged ahead and attempted to cross her bow to rake. But Bainbridge avoided this by skillfully bringing his ship around in the same direction. The *Java* closed gradually to within pistol shot and made a second attempt. But the American wore around again. For the third time the *Java* tried, and once more Bainbridge frustrated the move. And the Englishman was forced to tack to keep his weatherly position.

Bainbridge anticipated this also by bringing his ship smartly around. She was the first to come up to the wind, and she gave the *Java* a good raking.

Both ships now ran off free with the wind on their quarter. Being severely damaged, the *Java* attempted to close intending to carry the fight hand-to-hand in good old British fashion to the American's deck. In running down on the *Constitution's* quarter, however, the *Java* fouled her jib boom in her antagonist's mizzen rigging. Here she was held while the American gunners swept her decks from stem to stern. The head of her bowsprit was the first to go. Then her foremast came tumbling down. The ships parted, the *Constitution* shooting ahead of the enemy. Bringing his ship around, Bainbridge came up alongside and engaged her yardarm to yardarm. At 3:55 the *Java's* mizzenmast went by the board, leaving only the mainmast standing, with the main yard shot away in the slings.

For a time the English had worked their guns with spirit, but now their fire suddenly ceased. Bainbridge thought they had struck. The ensign in the main rigging was down, and the ship was a wreck. So at 4:05, hauling aboard his tacks, he luffed across the *Java's* bow and passed to windward with topsails, courses, spanker, and jib set. He set about repairing damages and had been engaged in this about an hour when an ensign was sighted flying on the *Java.* Bainbridge immediately brought his ship again across the enemy's bow prepared to renew the action. But the ensign came down.

The third English frigate of the war had struck her colors.

Captain Lambert was mortally wounded, dying a few days later after being landed at Bahia. He was brought on board the *Constitution* where a cot was prepared for him on the quarterdeck. Bainbridge, supported by two of his officers, went up to the cot, and, presenting Lambert his side arms, said with emotion: "I return your sword, my dear sir, with my sincerest wish that you may recover and wear it as you have hitherto done, with honor to yourself and to your country."

In spite of the severity of his own wounds, Bainbridge remained on deck until midnight, directing the work of taking over the prize and making things shipshape again on the *Constitution.* Lieutenant Alwyn, a junior officer of the *Constitution,* was also severely wounded. He died some days afterward.

Bainbridge was a little distrustful of Brazilian ports. Indeed, American naval officers went into none along the whole South American coast with any too much confidence. Portugal and Spain were inclined to favor England for one reason or another, despite their show of neutrality. A British ship taken into one of them as a prize got about all the neutral protection the guns of its captor could command. The *Java* was too badly damaged to go farther than the nearest port, so rather than take her into Bahia Bainbridge ordered her sunk. Her wheel, though, was first taken to replace the one he lost.

The *Constitution* then went into Bahia, where the prisoners were paroled and landed. Among them, as a passenger on board the *Java,* was Lieutenant-General Thomas Hislop, recently appointed governor of India, with his staff. His appreciation for the kind treatment

(*Concluded on page 14*)

The *Constitution* cutting the *Java* to pieces off the coast of Brazil.

Liquor Law Enforcement

Bootleggers Who Say It Is a "Farce"

By MONTFORD T. STOKES

This is the second and concluding article.

ONE of the few women enforcement agents was once assigned to go to a popular eastern seashore resort to obtain evidence against café and hotel violators. A man was instructed to accompany her, as in such places a man and woman together dropping in for something to eat and drink are more apt to be successful in liquor "buys."

This woman was widely known throughout her own state as an effective moral leader and was respected and loved by her associates in the work. Fighting for prohibition for years, she had been in the very front rank of women crusaders and it was because of her effective service her companions insisted she should be rewarded with a place of authority, in the enforcement of the law she had been so ambitious to see on the statute books and in the Constitution.

She had been a lifelong total abstainer and the very idea of tasting liquor was abhorrent to her. But she and her companion had not been back from this assignment very long until it was whispered about by the employes of the office that this good woman, while in the discharge of the duty demanded of her, had imbibed sufficient liquor to cause her to be more or less under its influence. It was astounding information for her friends, and no doubt no other thing ever occurred in her life that so humiliated and embarrassed her.

About the same time a young man, fresh from college, who had had a brief connection with an Anti-Saloon League office, was sent out on a similar mission soon after becoming an enforcement agent, and, under very similar conditions, took his first drink and got his start as a regular consumer.

A Good "Buyer"

WHEN due consideration is given the handicaps that have from the beginning beset the path of prohibition enforcement, it must be admitted that it is amazing that any progress has been made or that it still commands anything like respectful consideration. Confronted with double-faced politicians, possessed of large powers, directed by officials who are expected to respond to the demands of these same self-serving officeholders and who do, and manned by a force of agents, most of whom are irresponsible and unsympathetic with their work, disloyal in their regard for the laws of their country and without the respect of those who know them best, it is remarkable that there has been any survival of law observance.

This disregard of the law is the fault of the politicians who dictate the appointments and the officials who make them, as there is scarcely a community in the land without good, earnest, honest men who are loyal friends of the law and who would be very thankful for an opportunity to serve their country in this way. In many instances the politician either is "wet" in his sentiments and practices and is squarely opposed to the law, or is a pretender—politically "dry" and personally "wet."

Their first purpose is to find a job for ward and small town heelers whose help they want on election day. Therefore, it is not unusual to find among prohibition agents many former saloon keepers, bartenders, gamblers, and even bootleggers. Senators and Congressmen are often imposed upon by their "good" friends at home, who make pleas for and obtain influential indorsements for men who do not have good reputations where they live.

But politicians are not the only persons who are careless with their indorsements. Prominent Anti-Saloon League officials and even ministers have been known to be responsible for the appointment of some very questionable characters. Occasionally an appointee with a shady past does very creditable work for a time, sometimes better than some from whom more should be expected; but they rarely stand up long.

Just as soon as every enemy of prohibition is driven out of the enforcement service and it is constituted only of sober, intelligent, energetic, earnest, loyal and patriotic supporters of law and order there will be an immediate change in the results, and the claim of the bootlegger and his abettor that enforcement is a "farce" will mean nothing, while their law-defying activities will rapidly grow less fruitful and their crime-breeding profession will prove the "joke and failure."

No private employer would for a moment consider the selection of a man to represent him in any business, whom he knew to be interested in its destruction and whose sentiment and character plainly indicated his natural hostility to its interests.

Only State and Federal administrators will knowingly take such chances.

In the springtime of 1923 the state director of one of the largest Federal enforcement offices came into possession of information convincing him that a general agent, who had been transferred to his domain from another state, was frequently guilty of flagrant offenses against both the moral and civil laws and was an outstanding disgrace to decent manhood. Although a very tolerant and forgiving official and very apt to find himself on the side of mercy when dealing with transgressions by members of his force he found himself in this case thoroughly aroused and he promptly decided on suspension and notified the offender by telegraph.

It was a very provoking matter, involving drunkenness, unfaithfulness, and dishonesty and the director felt he could now get rid of this man who had so grossly disgraced the service. Imagine, however, his astonishment and humiliation when very soon after he reached his office the next morning, his secretary called him to answer a call from Washington and he was instructed by a superior officer that the suspension order must be rescinded and that the man must be kept on the force.

When he asked the reason for the setting aside of his judgment, the director was frankly told that this violator had been recommended by an official very prominent in the national administration, and that his removal could not be considered.

Another Federal agent was from a suburban town and he was not long in demonstrating that he was capable of doing effective work in securing evidence. He could drink a good deal of liquor before being intoxicated, and he soon earned the reputation of being a good "buyer" and consumer. His appearance and congenial personality made it easy for him to impress the liquor sellers that he was on the square with them. He made many "buys," swore out many warrants for violators, and was soon the chief prosecuting witness in many Federal court proceedings.

But it was different when his first important case was on. The defendant had employed a noted criminal lawyer to defend him and when this agent took the stand he was given a merciless cross-examination. There was a pricking up of ears in the crowded court room when the defense attorney blurted out the question:

"Just previous to being sworn in as a prohibition agent, were you not a bootlegger, were you not making that your business?"

There was a still greater sensation when the witness frankly admitted that this was the truth.

When the attorney followed with questions concerning the defendant's appointment, and demanding to know who had been his sponsors, he named a well-known pastor of his own home town—who knew all about him. Naturally jurors did not feel like returning convictions on the testimony of witnesses of this sort and the usefulness of this agent was much weakened. But there seemed to be no idea of letting him out. He was retained in the service, and in a short time transferred to another city and given a more responsible position, being made a group head directing the work of several other agents.

When the recommending preacher was asked why he gave his indorsement to this person, his explanation in substance was that he knew this man was in close touch with the liquor business, knew many of the bootleggers and other violators, and that, being a popular fellow in that class, he could use his knowledge and personality to great advantage in the detection and exposure of such criminals.

An awakened public sentiment favorable to the cause has supported and backed prohibition enforcement in communities where it has attained anything like success.

Under the system generally followed by the Federal offices, agents are sent to a city or a community, unheralded and with disguised identity. They have no plans of procedure and are ignorant of local conditions. They are, as a rule, without information as to violators and violations, except perhaps a brief and unsatisfactory complaint, signed by no one, and, if signed, with the injunction, "Don't mention my name." True, agents so handicapped often accomplish a little—dig up a violator or two—and rush to the next assignment.

As public sentiment is one of the most important elements in successful law enforcement, in fact, the most important, agents assigned to work of this kind should be able to produce much greater results than those engaged in the ordinary routine of the department—chasing from one grog shop to another, trying to buy evidence, and following up here and there with a raid.

Lincoln's Slogan

IN MOST instances, if a raid is made in the forenoon, the place is open and ready for business again in the afternoon, with the same old stuff for sale. But with a group of first-class, local people constantly on the job the results are more far reaching, and soon decent conditions become permanent.

Working under the inspiration of the slogan with which Abraham Lincoln aroused an audience to action while making a temperance address in his early manhood—"Let us have faith that right makes might and in that faith as to the end dare to do our duty"—the possibility of accomplishment by these local clubs is practically limitless.

Particularly applicable to this phase of a discussion of ways and means for prohibition enforcement, is a great principle of government administration to which President Lincoln once gave utterance in the course of a public address, which is at once a model in expression, truth, logic, and wisdom:

"With public sentiment, nothing can fail, without it nothing can succeed. Consequently, he who molds public sentiment goes deeper than he who enacts statutes or pronounces decisions. He makes statutes or decisions possible or impossible to be executed."

This is just as true and sound as in Lincoln's day and every friend of law enforcement must give due heed to these potent facts if he hopes for the success of the great moral reform legally inaugurated by the enactment of the Eighteenth Amendment. Not only is favorable public sentiment necessary, but it must be awake and active; it will not do if it is dormant, weak or cowardly. It has been well illustrated just what a live-wire, red-blooded, fighting and uncompromising public sentiment can do when completely aroused and intelligently directed.

Turning Point in the Life of a Great American

Henry Wadsworth Longfellow

By FRANK DORRANCE HOPLEY

WHEN Henry W. Longfellow was a boy it was his custom to spend his summer vacations on the estate of his Grandfather Wadsworth, near Portland, Maine. It was his delight to listen to stirring tales of '76. One story in particular, that of a fight with the Indians, thrilled him exceedingly, and at 13 years of age he wrote his first poem, "The Battle of Lovell's Pond," which begins:

"Cold, cold is the northwind and rude is the blast
That sweeps like a hurricane loudly and fast."

Without telling anyone but his sister what he had done, young Longfellow sent the poem to the Portland *Gazette,* signing it simply "Henry."

The next morning Longfellow walked up and down in front of the newspaper office in a snowstorm, fancying that his poem was being set up, and that the typesetters were stopping to read and admire it. The next day it did appear, and Henry read and reread it, and each time he did so it seemed to him more beautiful.

That evening he was at the home of a friend, Judge Mellen, who remarked: "Did you see the piece of poetry in today's paper? Very stiff, remarkably stiff; and what is more, it is all borrowed, every word of it."

Without waiting longer, the boy hurried home and sobbed himself to sleep, but in the morning, when he arose, a great determination had entered his soul that some day he would write poetry that every one would admire.

Choosing His Path

AS LONGFELLOW was just about to graduate from Bowdoin College, the necessity of choosing a career was on him. He wrote to his father:

"I want to spend one year at Cambridge to read history and to become familiar with the best authors. The fact is, I most eagerly aspire after future eminence in literature, and every earthly thought centers in it. I have a most voracious appetite for knowledge. To its acquisition I will sacrifice everything."

His father, being of a practical turn of mind, replied:

"A literary life, to one who has the means of support, must be very pleasant. As you have not had the fortune to be born rich, you must adopt a profession which will afford you subsistence as well as reputation."

Young Longfellow reluctantly turned his thoughts toward law, though he hated it, and if it had not been for a fortunate happening, a great poet might have been lost in a poor lawyer.

The professorship of modern languages, just created at Bowdoin, was offered to Longfellow, and money was provided that he might study three years abroad to fit himself for the position. This was a turning point in his life, and with his return to America he entered into his duties full of zest and hope.

Five years later Longfellow was offered a professorship at Harvard University, and with his wife, went to Europe to study before taking his new position. There Mrs. Longfellow died, and his grief was overwhelming. He returned home and entered on his duties at Harvard. In his depression, he again turned to poetry, of which he had scarcely written a verse in several years, and during his spare minutes he devoted himself to making verses. It was during this period of sorrow that some of his most beautiful poems were written, "The Psalm of Life," "The Reaper and the Flowers," "The Wreck of the Hesperus" and "The Skeleton in Armor."

Eight years later he was again married, this time to the beautiful Frances Appleton, and now, at the age of 36, life opened to him anew.

On their wedding trip the couple visited the wife's relatives in Pittsfield, Massachusetts, and while there, seeing an ancient clock in the hallway, Longfellow composed his poem, "The Old Clock on the Stairs."

Shortly before his marriage, Longfellow had strained his eyes by using them in the twilight. Now his wife acted as his amanuensis. Her society was ever an inspiration to him, and he often declared that his marriage to this talented woman was the great turning point in his life.

Now followed "Evangeline," "Hiawatha," "The Courtship of Miles Standish," and other of his best poems.

Again the turn in the road came for the great American poet and this time a tragedy. Mrs. Longfellow let fall a lighted match on her thin dress, and before her husband could stamp out the flames, she was fatally burned. "How can I live any longer?" he wrote in his journal. Yet he did live for 20 years, and did his most beautiful work. Two years before he died, he wrote, and put away in his portfolio not to be published, a tribute to the woman, the memory of whom still acted as an inspiration:

THE CROSS OF SNOW.

"In the long sleepless watches of the night
A gentle face—the face of one long dead—
Looks at me from the wall, where round its head
The night lamp casts a halo of pale light.
Here in this room she died; and soul more white
Never through martyrdom of fire was led
To its repose; nor can in books be read
The legend of a life more benedight.
There is a mountain in the distant West
That, sun-defying, in its deep ravines
Displays a cross of snow upon its side;
Such is the cross I wear upon my breast
These eighteen years, through all the changing scenes
And seasons, changeless since the day she died."

On Altering the U. S. Constitution

Often Easy When Manipulation Is Used, Otherwise Difficult to Amend Basic Law Owing to "Lame Duck" Proceedings

By AARON HARDY ULM

Did you ever vote on an amendment to the Constitution of the United States? Probably not and even if you did the vote was not binding and in all likelihood didn't count. It is possible for fewer than 3,000 persons to make any change whatever in the fundamental law of the land, and in total disregard of what others think about it. This article tells the story of past "amending waves" and shows how they were expedited by the faulty process set up for making changes in the national charter of government and freedom.

"WE, THE people of the United States, ..." So begins the Constitution of the United States, and correctly. But does this hold as to amendments which since have been tacked on that document and others that may be added to it? Since the ratification of the Constitution as originally drawn, "we, the people" of the country, or of any state, never have passed directly or conclusively on a single change that has been proposed or made. Only fractional proportions of them have done so.

While "the people of the United States" now number more than 100,000,000, *it is possible today for fewer than 3,000 persons to make any change whatever in the fundamental law of the land. And after one is made, it is possible for as few as 167 persons to prevent its being revoked!*

"Trick" figures? Yes; in some measure they are; but to a great extent they are not.

For a change to be made requires the votes only of two-thirds of the members of Congress that are present when the vote is taken, together with majority votes in the legislatures of three-fourths of the states. The total membership of Congress is 531, and there are thirty-six state legislatures with an aggregate membership of only 2,316. Even assuming that all would be present when the votes on amendments are cast, it would be possible for 2,610 of these to do anything they pleased with and to the Constitution. In fact, if you want to speculate as to extreme possibilities, you will find that a much smaller number holds this singular power. For only *two-thirds of a quorum* in the two houses of Congress, and of *majorities of a quorum* in the state legislatures are required for amending the Constitution. And the repeal of an amendment can be blocked by majority votes in only one branch of the legislatures of twelve states. And there are twelve state senates whose aggregate membership is only 334.

"Jamming" and "Ramming" Is Made Possible

Of course, no amendment is apt to be submitted by two-thirds of half the members of Congress, though few if any disputed amendments have been adopted and submitted by two-thirds of Congress' full membership.

In the ordinary course of affairs the consent of only about 4,000 persons is required to amend the Constitution of the United States. These persons, however, are so distributed and hedged about that the process is by no means an easy one. Yet it seems to be historically true that several amendments that have been adopted were made possible—at least at the time—by the fact that the consent of only a comparatively few persons was necessary to their adoption. This does not mean necessarily that they were not supported by public opinion, it means only that their procurement was marked by "jamming" and "ramming" methods made possible by the limited number of minds to be moved, and that but for these they wouldn't have gone through at the time.

The framers of the Constitution referred the Constitution itself to the people of the various states, who were authorized to choose conventions for the sole purpose of passing on the document. In choosing the members of those conventions the people were able to express themselves directly as to the Constitution.

The amending process was not made so simple. It was provided that the Congress might propose amendments, to be passed on either by the state legislatures or conventions. It also was provided that on the demand of three-fourths of the legislatures a national convention might be called for submitting amendments.

These conventions were provided that the people as a whole might act directly both as to the submitting and ratifying of amendments. But the convention method has never been used. All amendments to date have been submitted by Congress to the state legislatures. These rarely if ever have been chosen with regard to amendments which they passed upon. In most cases legislatures that have acted on proposed changes in the Federal Constitution were chosen before the amendments were submitted.

Amendments That Expanded Federalization

The first ten amendments were submitted by the First Congress and were accepted without virtually any dispute. These, together with the eleventh and twelfth, which were adopted during the first twenty years of the government, were in the nature of "perfecting" amendments. Eleven of them *subtracted from* rather than *added to* the powers of the Federal Government. The twelfth made merely a routine change in electing the President. There was scarcely any opposition to any of these proposals.

Three other amendments were submitted by Congress during that period, two in 1789 and one in 1810. The first two related to Congressional apportionment and pay. The last provided that no citizen of the country should accept a title of nobility from a foreign power without Congress' consent. None of these amendments was either accepted or rejected by the states, and all of them still technically outstand.

At the close of the period another Amendment that likewise still outstands was submitted. It was put forward on the eve of the Civil War, its aim being to forestall that conflict. It provided that Congress should never interfere with slavery in any state except by the state's consent.

When that proposal was passing through Congress a strenuous effort was made by anti-slavery people to have it referred to conventions. Abraham Lincoln favored that method. But the pro-slaverites held out for legislative reference, which fact was turned on them when the second period of amending began.

This period followed the Civil War, its product being the Thirteenth, Fourteenth and Fifteenth amendments, all having to do with the results of the war.

These were the first amendments that expanded the Federal prerogative. Those who opposed them—or, rather the last two, as there was virtually no opposition to the one abolishing slavery—tried to have them referred to conventions, so that the people might have a chance to pass directly upon them. But they were referred to legislatures—through some of which they were "jammed" by the boldest sort of "strong-arm" methods.

In truth, it is believed that the courts since then have hesitated to look very closely into the ways by which several amendments have been procured on account of a fear that they might have to make rulings which would throw serious doubt on the validity of the Fourteenth and Fifteenth amendments.

The third amending period began with the submission in 1909 of the one providing for a Federal income tax. Even its sponsors had little hope of that amendment ever becoming a part of the Constitution, because it was believed by many that we had reached the stage whereby it was virtually impossible to amend the Constitution in the way provided therein. This feeling was so fixed that almost no serious agitation for new amendments was made during the quarter of a century preceding the third amending period. Many proposed amendments were introduced in Congress but committees gave no serious consideration to them. Even the submission of the Sixteenth or income tax amendment was the product of a parliamentary maneuver; it was not so much as referred to a committee.

But it was ratified with such expedition and ease that encouragement was given to all persons who would achieve their ends by way of changes in the Constitution. It opened up a new way for procuring rapidly and with minimum effort "reforms" which could be achieved otherwise—that is, by state action—only tediously, if at all.

Ratification If Delayed May Be Rejection

Within the fifteen years following 1909, four other amendments were proposed by Congress—those providing for the popular election of United States Senators, for prohibition, for woman suffrage and for Congressional control of the labor of persons under 18 years old. The last one now pends. Two of the others were carried through during or immediately following the World War. The adoption of these two served to illustrate the fact that only a comparatively small number of persons' consent being necessary makes it comparatively easy for a proposed amendment bearing on a sentimental problem and backed by a well-organized propaganda to be carried through during a period of national excitement.

Several interesting questions arose as to these two amendments. In one state, for example, where the state constitution says that the people may demand a referendum on any act of the legislature, its opponents forced the taking of a popular vote on one of these amendments. The vote was against the action of the legislature ratifying the proposal. But the United States Supreme Court held that this referendum was invalid; that, since the amendment was referred to it, the action of the legislature held in despite of its state constitution.

Another state's constitution provided that no proposed Federal amendment should be acted on by other than a legislature chosen after the amendment was submitted—that is, after the people of the state knew that the subject pended and therefore could express themselves regarding it in choosing legislators. But the legislature of this state went ahead and ratified as soon as the amendment in question arrived. A certificate of the ratification was hurried to Washington, and, being the thirty-sixth, the Secretary of State was aroused out of bed at midnight, and then issued a proclamation declaring ratification completed.

The legislature in question later revoked the act of ratification, and held that it had been put through illegally. A second certificate, to that effect, was sent to Washington. But the courts held that the Secretary of State had no authority to go behind a state's certificate when properly authenticated, and that his proclamation based on the first one stood. This largely was an academic question, for, meantime, other legislatures had ratified the proposal, but the action of the legislature in question easily might have been a conclusive one. And it is generally agreed that it was brought about by manipulation of the most suspicious sort.

Under the precedents and court decisions, therefore, manipulation is much more effective in securing the ratification than the rejection of amendments.

In fact, there is doubt whether an amendment can be rejected conclusively by the state legislatures. The Federal statute defining the machinery for handling amendments after they are submitted by Congress takes no notice whatever of possible rejections. It says merely that when three-fourths of the states have ratified the Secretary of State shall proclaim the amendment a part of the Constitution.

No submitted amendment ever has been affirmatively rejected by the states, though, as stated before, four have never been acted on finally one way or the other.

In the case of the Fourteenth and Fifteenth amendments the legislatures of several states, after ratifying, reversed themselves and rejected the proposals. Though these shifts were made before a proclamation was issued from Washington, Congress directed the Secretary of State to ignore the changes and to proclaim ratification on the basis of the first actions.

Hence it is unsettled whether a state may reverse a ratifying act, even when the reversal is attempted before the Secretary of State proclaims ratification. It is settled, however, that *an act of rejection can be reversed.*

This may mean that once it gets through Congress, a proposed amendment may float around forever—or until ratified. That is to say, it is not certain that if all the legislatures were to reject the pending Twentieth amendment this year they could not during the coming year ratify it and still make it a part of the Constitution. Many advocates of the amendment believe that this is true—and declare that the fight for it will go on regardless of what the legislatures may do now. The Supreme Court held in a case arising on account of the Eighteenth Amendment that an amendment must *be ratified within a reasonable time after submission* or be considered rejected by inaction. But there is no definition of a reasonable time.

A Movement for Putting On the Brakes

Some constitutional lawyers say that if twelve or more legislatures were to reject a proposed amendment the Secretary of State would be warranted in issuing a proclamation declaring the matter at an end. Some say that he might be mandamused and compelled to do so, the basis of this contention being that the law by implication requires that such be done. Others believe, however, that the letter of the law would prevail. Congress, of course, might amend the law so as to provide for declaring the rejection of amendments.

This, however, is probably true: A legislature must reject affirmatively and see that the act is so certified to Washington for it to count in the premises. To vote down, for example, a resolution of ratification would alone mean mere failure to act, and leave the way clear for later ratification. One of the legislatures cited as having rejected the so-called "child labor" amendment, merely voted down a resolution of ratification.

Improvements in the machinery for making formal changes in the Federal Constitution is proposed in an amendment now pending in Congress. It is a sort of anti-amendment proposal, in that it aims at making the amending process more difficult in times of hysteria and less amenable to manipulation and propaganda.

It provides that no legislature shall act on a proposed amendment until or unless one of its houses is elected after the proposal is submitted by Congress. This would give the voters a chance to express themselves.

It also provides that any state may require that legislative action in the premises be confirmed by popular vote.

It provides further that until an amendment is finally accepted or rejected any state may change its action regardless of its nature.

The supporters of this amendment are those who object to hasty or manipulated changes being made in the Constitution, and who oppose the tendency toward Federal centralization which has been expedited by virtually all amendments adopted since the Civil War, which would be carried forward by virtually all other amendments now pending in Congress. These number around one hundred, though many of them are duplicates and few of them have the slighest chance of being submitted. Only one other has been given so far any serious consideration. It is the Norris amendment, which would have the inauguration of the President take place in January following each Presidential election. It also would have each new Congress begin its work in January following election, thus eliminating the "lame duck" sessions of every Congress and the long period between the election and the taking of office of a new President. This proposed amendment has been approved by the Senate.

Process Becomes Dangerously Easy in Certain Cases

Although there is no great opposition to either of these proposals, the prospect of either of them being soon adopted is not good for the reason that they make no emotional appeal and command no widely supported propaganda—without which it is evident that it is exceedingly difficult to bring about formal changes in the Constitution. But with these aids the process often is a dangerously easy one.

Cathedral of the New Jerusalem

A Sermon in Stone Inspired by the Followers of Swedenborg

By WILLIAM A. M'GARRY

MOTORISTS traveling the Lincoln Highway and other through roads north from Philadelphia are often able on unusually clear days to catch a glimpse of a Gothic tower that seems to stand in the center of the wooded hills, its pinnacles rising against the sky above the tops of the ancient white oaks for which this region is famous.

Many of them turn aside in search of a closer view and get tangled in a veritable maze of perfect roads, but the traveler with enough persistence and a motor powerful enough to climb the steep hills is rewarded by a sight not to be equaled elsewhere in America for sheer architectural beauty. Indeed, it is to be questioned whether the setting of the building that meets his eye has been rivaled even by the master builders of the European Guilds, or by the Greeks of still more remote antiquity.

The main body of this building has only recently been completed. Although work is still under way in the construction of a wing, a general view of the structure may be had unimpeded by workshops. Officially the building is called the Cathedral of the Church of the New Jerusalem, and as such it is the world center of a cult whose followers make up in devotion what they lack in numbers.

To outsiders the church is known as the Bryn Athyn Cathedral. It is located on the top of the highest hill in the hill country of Montgomery County—almost in the center of the community of Bryn Athyn. Even at a distance of a half-mile it seems to be alone in the forest. It is only on closer view that it is seen to be part of a far-reaching institution, the buildings of which are dwarfed by the trees.

Its architectural features have made this cathedral a sort of textbook in stone for artists and architects, among whom it is a constant topic of admiring discussion. But the story of how it was built is to the layman its most remarkable feature. Nowhere on all its intricate surfaces of stone and wood and glass is there to be found the mark of a machine tool. Stone by stone and timber by timber it was put together by hand—by

Cathedral of the New Jerusalem Church at Bryn Athyn, Pennsylvania.

the hands of artisans recruited from all over the world. Not only that, but every stone and timber was cut by hand to duplicate models made in three sizes and often studied in every detail by the artisan before he set to work reproducing them.

The idea back of all this was to build a cathedral as the famous edifices of the Middle Ages were constructed, by craftsmen intent on constructing a perfect thing. In the opinion of many architects the two men who were the moving spirits in the work succeeded far beyond their dreams. They not only recreated the spirit and work of the guilds, but also imparted to the work of these craftsmen secrets of stone fashioning that have been lost to the world since the decline of the ancient Greeks.

The late John Pitcairn, head of the Pittsburgh Plate Glass Company, was the man who conceived and launched the project. Ground was broken in the autumn of 1913, and the cornerstone was laid in June of the following year. Mr. Pitcairn did not live to see his dream come true, but long before his death he had assurance that it would be completed.

Raymond Pitcairn, his oldest son, took up the work when his father's health began to fail. Even during the latter's lifetime he had become the moving spirit of the project. He gave to it time and energy that were beyond the reach of the older man. During the early stages of

Interior view showing the sanctuary and the great stained-glass window.

the work he went abroad and, equipped with an architect's knowledge and the soul of a poet, studied all the famous cathedrals of Europe. He studied also the ruins of Greek temples that modern builders have sought vainly to reproduce.

The famous Ralph Adams Cram, of Boston, was the original architect. He designed the building as it was projected by John Pitcairn. But on the death of the latter, Raymond Pitcairn took charge of the architectural designing, as well as the active direction of the building. It is to him that credit is given by artists for the amazing effects achieved. Lines that in familiar Gothic work are stiff and rigid have been given a flowing softness without in any way detracting from the sturdy strength of the structure. Tricks of perspective have been achieved in three dimensions that were considered impossible save on a flat surface.

The cathedral is like a many-sided picture. Most buildings, like most pictures, must be seen in a certain light and from a fixed point to appear at their best. The Bryn Athyn Cathedral seems equally perfect from any angle, at any time of day or night.

The reason for this is to be found in the extraordinary pains taken in building the edifice. Work on the foundations and lower walls was relatively easy. Above them every course of stone was subjected to the most minute scrutiny not only by Mr. Pitcairn, but by his associates. At one time a flight of granite steps leading to the main entrance was rejected after it had been put permanently in place, because of some slight incongruity. The steps were torn out and an entirely new flight built. The method of conducting the work was such that although unusual precautions were taken, it was impossible to tell accurately in advance how a given design would look in relation to the whole until it was put in place. When it failed to achieve the harmony he sought, the builder invariably rejected it.

The New Jerusalem Church is the name adopted by the followers of Emanuel Swedenborg, or Swedborg, the Swedish philosopher, scientist, traveler, and mystic. Swedenborg was born in Stockholm, January 29, 1688, and died in London in 1772. Early in his life he became interested in the Scriptures. He became one of the leading Hebrew scholars and soon began to write, expounding his interpretations of the various books of the Bible. At the time of his death these constituted a complete religious philosophy.

Swedenborg himself, although a preacher and lecturer, made no attempt to found a new denomination, contenting himself with the publication of his interpretations of the Word. But after his death the influence of his writings multiplied. Fifteen years later, in May of 1787, the New Jerusalem Church was founded in London. Its first general conference was held two years later in the Great Eastcheap Church, London.

The church teaches a gospel of peace and brotherly love, and enjoins on its membership a life of simplicity and piety. It is said that the total following in the United States is about 8,000 with about the same number in England. The only other settlement of any size in this country besides Bryn Athyn is near Chicago. It is of interest to note, however, that the Swedenborgians as a rule are persons of unusually high mental standards. There is a broad line of mysticism running through all the simple teachings of the founder that has appealed to dreamers and poets.

The first of the New Church preachers to appear in the United States was James Glen, a Scot who had been preaching in London. He came to this country about the beginning of the last century and lectured in many cities along the Atlantic seaboard. At that time societies were formed in Baltimore, Boston, New York, and Philadelphia. Records of these are found as early as 1817, but it was not until 1856 that the community now known as Bryn Athyn had its beginning.

Mr. Pitcairn was instrumental in establishing this—in fact it was he that bought the land in what was then known as Alnwick Grove. The spot is a group of hills overlooking the beautiful Huntingdon Valley. At that time it was almost a wilderness.

In company with his wife and certain leaders of the cult, Mr. Pitcairn toured all Eastern Pennsylvania to find a suitable site for a school. This has now grown to the New Church Academy, in which children of members of the denomination are educated. It comprises full university courses as well as the most elementary branches, and draws on the knowledge of the world. Particular reference is paid to the study of Hebrew, so that graduates are able to

A page from Swedenborgian manuscript on the laws of physics showing his idea of a heavier-than-air machine.

read the Bible in the original. The academy was heavily endowed by Mr. Pitcairn. He built his home, Cairnwood, on one of the hills. Other beautiful suburban homes were constructed, and a half-dozen years ago the community obtained from the courts a separate charter. By that time it had the finest roads in the country, paid

He Is Mexico's Thirteenth President

But General Calles Hopes to Begin New Era by American Methods

By JOHN SLOAN

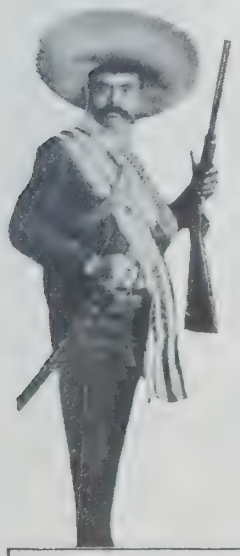
MEXICO has had almost a ruler a year, on the average, since she held her celebration of one hundred years of freedom from Spain, in September, 1910. In fact, the thirteenth president in these fourteen years has taken his seat in the big black teakwood chair in the National Palace in Mexico City. Of these thirteen, eleven have been unable to serve out the terms for which they were elected, or for which they were imposed, by force of arms, on the people. What will happen to the thirteenth is a matter for conjecture, albeit one of no little interest to the United States, whose investments in Mexico total approximately $800,000,000. The twelfth president, who retired at the end of 1924, was able to hold the presidency, partly by armed strength and partly by personal ability, for the full period allotted him.

The thirteenth president, General Plutarcho Elias-Calles, comes into office succeeding Alvaro Obregon, and those presidents who preceded the latter are:

Porfirio Diaz, who went into voluntary exile in the spring of 1911. Francisco Leon de la Barra, who became president *ad interim,* succeeding Diaz, until Francisco Inocente Madero, head of a revolution against Diaz, could take office. Madero ruled from November, 1911, to February, 1913, when he was deposed and assassinated as a result of a military uprising, headed by Felix Diaz, nephew of Porfirio, and Bernardo Reyes. Federico Gamboa served as president for 46 minutes, succeeding Madero, until he could resign in favor of Victoriano Huerta. The latter was forced out of office by the combination of pressure from Washington and attack by a revolution headed by Venustiano Carranza. Francisco Carvajal then served for a few weeks, until Carranza could take possession.

Revolutions headed by Francisco Villa in the north and Emiliano Zapata in the south compelled President Carranza to accede to demands for two so-called "peace conventions," both held in Aguascalientes. At the first of these Eulalio Gutierrez was named president. He found the presidential duties too arduous and fled in a few months. At the second convention, Roque Gonzalez Garza was placed in the presidency. He, too, fled, after six weeks in the chair. Lagos Chazaro was appointed "provisional president" by Carranza, with the consent of Villa, Zapata not being in this agreement. Chazaro disappeared in a few weeks, and Carranza named himself president, only to be ousted by a revolution headed by Alvaro Obregon, Plutarcho Elias-Calles and Alfredo de la Huerta, the last named of the triumvirate becoming president in the meantime until Obregon could hold an election and be declared the duly elected chief executive. And now comes General Calles, also "duly elected" to the presidency.

Of these thirteen presidents, De la Barra is in France; Gamboa in Mexico; Carvajal in New Orleans; the whereabouts of Gutierrez, Garza and Chazaro unknown, while Diaz, Madero, Carranza and Huerta are dead, Diaz and Huerta having escaped Mexico with their lives to die natural deaths in foreign countries, while Madero and Carranza were assassinated. De la Huerta is among the missing, probably in hiding either in the United States or some of the Latin-American republics. Obregon is retiring from the presidency, and report has it that he will become minister of war in the Calles cabinet.



Experience of eleven of these presidents would indicate that the only avenue of escape from the presidency of Mexico is flight or death, though the twelfth man to rule from the palace on the Zocalo has managed to maintain his health and his office down to date. The new president, General Calles, is of different character, environment—one might say hereditary tendencies—and political beliefs from those who preceded him in the presidency, all of whom were known to the writer.

The National Palace, seat of the federal government in Mexico City.

Better to understand the scene into which the new president steps, let us for a moment consider briefly the manner of men who have preceded him. Diaz was a man of the soil, a three-quarter blood Mixteca Indian, who developed into a paternalistic dictator. De la Barra was essentially a diplomat, having been ambassador to the United States, and not an executive. Madero was a pronounced Socialist who desired to accomplish his plans by means of the ballot rather than the bullet. He would have made a capable president for Mexico fifty years from today. Federico Gamboa, the famous "forty-minute president," is an attorney devoting virtually all his time and abilities to international law. He was as glad to lay down the presidency as he was sorry to take it up. Huerta was a military dictator; Carvajal another attorney and a judge. Gutierrez, Garza, and Chazaro were native opportunists and politicians who had little or no effect on either government or people of Mexico. Carranza had been the mouthpiece in the senate of the Porfirio Diaz dictatorship, a judge, and governor of the State of Coahuila. He was qualified for small government, not for large affairs. De la Huerta was a business man converted by revolution into a soldier, who, when his own schemes came to naught, started a revolution of his own which was defeated, no later than 1924. Obregon, a farmer, descendant of an Irish adventurer, militaristic in his tendencies, but broader in his angle of vision than the majority of those who preceded him, still lacked both experience and competent advisors in international affairs.

Thus, Mexico has been governed by militarists, socialists, politicians, legal experts, judicial minds, and adventurers, yet never has been given what she at all times has needed, an economic government, a business administration. It remains to be seen how close to this great necessity of every Latin-American republic the new president will be able to steer the Mexican ship of state. General Calles is far from being a Conservative; neither is he the Radical, nor yet the Socialist, he has been pictured. It is quite certain that his government will not be Red, though it may be rather pink in spots. He declares that he believes in "Mexico for the Mexicans" even more strongly than does President Obregon, but both of them appear to realize that Mexico cannot supply the needed capital for its industrial, commercial and agricultural development, and that conditions for foreign investment in Mexico must be such that other nations will send capital and men there.

Born of a family of agriculturists, General Calles has been by turns farmer, merchant, soldier, judge of military courts, ruler of a state, member of the Mexican cabinet and practically premier of that body, and extensive employer of labor. As secretary of the interior he had a large part in the application of the celebrated agrarian laws, by which it was sought to divide the large and idle estates among persons who would produce food supplies from the soil. The plan has not been a complete success, largely through faults inherent in the law, but the economic condition of the Mexican peon today appears to be much improved as compared with his condition at any time during the past three centuries.

It is the announced determination of General Calles to apply prohibition of the manufacture and sale of intoxicating liquors to Mexico as rapidly as possible after his inauguration. A few months ago, the president-elect issued a statement in Nogales, Sonora, to this effect. There is now a Mexican law, well enforced, which compels the closing of saloons at an early hour in the evening, and forbids them to reopen until a comparatively late hour in the morning. This law was designed to protect workers from the saloon and its influences both after work in the evening and before working hours in the morning. It has been a remarkably effective law, particularly in the larger cities, such as Mexico, Guadalajara, Puebla, Monterey, and Vera Cruz. Demands for liquor by American tourists in Tia Juana, Mexicali, Nuevo Laredo, Juarez, and other points along the border, have worked to nullify this statute in those towns.

The thirteenth president of Mexico is confronted with the necessity of establishing and maintaining an economic and industrial government, rather than a political one. The army threatens a revolution, but it is generally believed that the appointment of the retiring president, General Alvaro Obregon, as minister of war, will avert this uprising. It is written in the history of Latin-America that no purely military revolution ever has proved a permanent success, or ever has been able to hold control even after overthrowing a government. A vivid example of this was the army uprising headed by Felix Diaz and Bernardo Reyes, and, later, by Victoriano Huerta. The Madero government was overthrown and the president murdered, but the heads of the military revolution soon were out of power and forced to flee the country.

Mexico's public debt approximates seven hundred million dollars, about one hundred million less than the investment of American capital in Mexico, and less than half the total foreign investment in that country, which is variously estimated at from one and one-half billion to two billions, probably nearer to the former figure than to the latter. Mexico falls far short of producing enough corn, beans, Spanish peas (*garbansos*), rice, or other foodstuffs to supply her population of approximately 15,250,000. Production of an adequate supply of food would reduce the heavy imports of these commodities, build up a race of better nourished people, and pave the way for the only industry for which the mass of the Mexican population is fitted—agriculture. The development of this industry is also closely linked with reduction of the external debt of the southern republic, and the president-elect has announced that he will devote the strength of his office first and foremost to the advancement of agriculture.

When one remembers that of the fifteen million or more inhabitants of Mexico there never have been more than 150,000 men under arms on both sides at any time in the fourteen years of revolution which that country has suffered, it appears quite clearly that 99 per cent of the people are not interested in revolutionary movements. It is to this 99 per cent that President-elect Calles promises to devote his attention, rather than to the upbuilding of a military machine which would increase taxation and involve the country in further internal strife.

Under the Obregon administration elementary education was advanced to a remarkable degree throughout Mexico. More than 200 new primary and grammar-grade schools were opened in the year from June 30, 1923, to July 1, 1924. General Calles has promised that he will put the national department of education in a position to exceed this record during his administration. A large number of schools were established in Mexico during the thirty-five-year rule of Porfirio Diaz, but the majority of these schools were of the higher grades, or else devoted to military training and to the arts, with very little attention paid to agriculture, manufacturing or commerce. The educational necessity of Mexico today is the school which will teach reading, writing and arithmetic, and then release the greater number of the pupils to carry on the work of the nation,

Cathedral of the New Jerusalem

Concluded from page 12

for by the inhabitants out of their own funds and without any call on the tax funds of the county to which they had contributed. They had also paid all the costs of educating their children, in addition to the original endowments established by Mr. Pitcairn.

The academy was founded in 1877, and at that time the nucleus of the present library also was established. Mr. Pitcairn and other followers of Swedenborg each contributed a few of his more widely known works, and funds were established for the purchase of others.

Today the library contains approximately 49,000 volumes and there is nothing else quite like it in the world, even in Swedenborg's home in Sweden. For, in addition to the collection of general literature, the library contains the largest and most complete gathering ever made at one place of the works of Swedenborg himself, and the works to which he referred in his writings.

A tour through the many rooms of the building devoted to this purpose gives the layman only a slight idea of the tremendous amount of work produced by the Swedish mystic, according to scholars at the academy. Research work has been under way at the academy for a quarter of a century for the purpose of tracing the life history of Swedenborg, and yet at times even now the experts come across traces of books and pamphlets by Swedenborg hitherto unknown.

Officially, Swedenborg is credited with approximately two hundred literary compilations; but even that figure fails to furnish an adequate idea of his output. Some of the books referred to as single works are so large as to require from six to ten volumes of printing. When it is borne in mind that all of this output was made in Swedenborg's own handwriting originally, his work assumes almost inconceivable proportions. One of the illustrations reproduced herewith is a copy of an original manuscript in Swedenborg's hand, now in the Royal Museum at Stockholm.

When the Bryn Athyn Academy started to gather books on Swedenborg the world was searched for original manuscripts that could be purchased, but so far the library has succeeded in getting only a few letters. It has hundreds of copies of first editions published by Swedenborg, and it has a complete set of photographic copies of his own originals.

It is said by scholars at the academy that no other man in the history of the world attempted to cover so wide a range of human knowledge as Swedenborg. On one of the pages of his books is to be found his drawing of an airplane. He never attempted to demonstrate or build it, but his studies in physics had convinced him that a heavier-than-air machine could be made to stay aloft. It was his idea that it would be operated by man power. The gliders of today are in a sense a development of his idea.

During the first half of his life Swedenborg devoted his talents to scientific matters and information of general interest. He wrote books which are said to be still of value on chemistry, physics, geology, astronomy, and mathematics. Then he went into biology, with particular reference to the human body and its functions. His production on this topic alone would represent a life work for most scientists. In recent years Swedish and German scientists have been turning to his works to check up on their own modern experiments, and have been amazed at the knowledge he had attained.

The first theological work by Swedenborg was published in 1749, in Latin. It was the "Arcana Coelestia." His main religious works thereafter were the "Apocalypse Revealed," "Conjugal Love," "Divine Love and Wisdom," "Divine Providence," "Four Leading Doctrines," "Heaven and Hell," "True Christian Religion," and "Miscellaneous Theological Works." "The Apocalypse Explained," "Posthumous Theological Works," and the "Index to the Arcana" were published after his death. These, however, are only the main volumes. The "Arcana" is generally published in eight books.

One room at the library is devoted to original editions published by Swedenborg, and to the richly bound photographic copies of his own manuscript originals. Another room is set aside for the books to which he referred in his writings. It was even more difficult to gather this than the Swedenborgian books, and today the collection could not be replaced and cannot be matched anywhere else in the world.

Originally the academy had only the theological school, the chief purpose of which is to educate young men for the ministry of the New Church. Since its foundation it has added the college, for the higher education of men and women in the sphere of philosophy and social ideals of the New Church; the secondary school for boys and girls from 15 to 18 years of age; the Bryn Athyn elementary school, for children 5 to 14 years of age; the library and archives, and the publication office and book room.

When the community had become the largest of this church in the world, Mr. Pitcairn developed the idea of building the cathedral. How much the building has cost is a matter of conjecture. The Swedenborgians have shunned publicity. It is known, however, that the elder Pitcairn left some two million dollars to complete the work, in addition to vast sums expended during his lifetime. The rest of his fortune was left to his sons, and their funds have been available for whatever was needed.

None of the work of building the cathedral was let out on contract. Most of the artisans were brought from abroad. Raymond Pitcairn searched Europe for stone masons imbued with the spirit of the Middle Age craftsmen. He found them here and there in villages, most of their work being the repair of statuary or other delicate bits of earlier workmanship.

In time he built up an organization of these men. Most of them lived near the project. Stone for the walls was quarried a half-mile from the church and brought to the site in huge blocks, where it was fashioned to shape. The sandstone for the interior came from Ohio.

One of the features that lends distinction to the edifice is the seemingly spotless whiteness of the tower. This is due to the fact that a special stone containing natural oil was obtained at Bowling Green, Kentucky. The effect of the oil and the elements is to bleach the stone, so that instead of becoming gray with age it has grown whiter year by year.

In the handling of all these and other materials the same painstaking method was used. First a cardboard model of the entire project was made, and changed again and again. Then each detail was modeled to a tiny scale. After that another model, larger, was made. When this had been perfected in its relation to the whole, a full-size model was constructed and placed in position on the church to determine its harmony. Only when that had been achieved was work started on the permanent piece.

When the stone work was well under way Mr. Pitcairn discovered that there was nowhere in the world he could get the necessary craftsmanship in the making of stained glass. Winfred Hyatt, a member of the church and an artist, took up the study of stained glass and scoured the world for craftsmen. By the time the building was ready for its windows a fully equipped organization was functioning on the site for their production. A similar procedure was followed with reference to the furniture, roof and wood trim.

Within a few miles of the cathedral were to be found some of the finest white oaks in the world. This area had been acquired by Mr. Pitcairn. The timber was hauled to the site, seasoned there and fashioned by hand. A sawmill built for the purpose handled some of the work, but a great deal of it was too large for machinery. Every roof beam was hewn out by hand. All the carvings also were done by wood sculptors. The roof was built first on false work, the same preliminary models of all details being made.

Recently, following the dedication of the edifice itself, it became known that Mr. Pitcairn plans to surround it with lesser structures, some of which are now under way. The greater part of the work has been done regardless of weather conditions. Stoneworkers operated under a temporary frame structure with a glass roof. This was done not to expedite matters, but rather to be sure that each man would have all the time requisite to do his work perfectly.

The Bryn Athyn Cathedral is now the world center of the Swedenborgian cult. In the library of the academy (sixty thousand volumes) repose many of Swedenborg's works, including a few of his original letters. There conferences of the denomination are held from time to time, and members of the creed make pilgrimages to the edifice from all parts of the world.

Chief Justice Robert N. von Moschzisker, of Pennsylvania, is a member of the Bryn Athyn congregation. Emerson's brother was a member. George Washington is said to have been a student of Swedenborg's works.

As one result of the ten years of unremitting attention given to the construction of the edifice, an artists' colony has been established nearby, and almost any day groups of students may be found on the surrounding hills trying to catch and transmit to canvas the spirit of the tall white spire.

Leaves From Naval Log Books

Concluded from page 9

he received from the Americans was expressed upon leaving the *Constitution* at Bahia by a gold sword, which he presented to Bainbridge.

Giving up the cruise to the East Indies for the time, Bainbridge weighed anchor for home January 6, arriving at Boston, February 27. His victory was hailed with the greatest rejoicing. The insignificant little navy that President Madison had intended keeping safely moored up in the harbors out of harm's way was giving a good account of itself. Three British frigates beaten decisively in four months! Congress voted the usual gold and silver medals for the officers, with $50,000 prize money for the crew to make up for the loss of the ship.

As for *Old Ironsides*, she was in need of extensive repairs. By the time these were made the British had her pretty well blockaded, and it was not until the winter of 1814-15 that she was able to slip out to sea again.

The yelp that went up from the British lion at the loss of the *Java* was heard round the world. Lloyd's had just published a list of five hundred merchantmen taken by the Americans during the first seven months of the war. The London *Times* of March 20, 1813, the day after the news arrived in England, exclaims:

"Five hundred merchantmen and three frigates! Can these statements be true? And can the English people hear them unmoved? Any one who had predicted such a result of an American war this time last year would have been treated as a madman or a traitor. * * * * Yet down to this moment not a single American frigate has struck her flag."

For two weeks the *Hornet* kept her vigil over the *Bonne Cityonne*. It had settled down to a game of sitting the other out, when late in the afternoon of January 13, His Majesty's ship of the line *Montagu*, 74 guns, hove in sight, much to the consternation of the little blockader, who was glad to take advantage of the gathering darkness to scamper off. She stood northward and eastward for Pernambuco, taking several prizes including the brig *Resolution* with $25,000 in specie.

Continuing her cruise down the coast, the *Hornet* neared the mouth of the Demarara River, February 24. A brig was sighted and the *Hornet* gave chase, running in toward short until warned off by shoal water. According to Lawrence's reckoning he was two and a half leagues from the fort at the entrance of the river, well outside the neutral three miles. The chase set English colors and he determined to attack. He was beating around Carabana bank, which lay between him and the chase, when another sail was sighted on his weather quarter.

It was 3:30 in the afternoon. The *Hornet* continued its chase gradually working to windward. At 4:20 Lawrence made out the second sail to be a large man-of-war brig. A few minutes later she showed English colors. Lawrence cleared for action and beat to quarters. He kept his ship close to the wind to get the weather gauge. At 5:10, feeling sure he could weather the Englishman, Lawrence broke out his colors and tacked.

Both ships were now standing for each other, the *Hornet* on her starboard tack and the enemy on her port tack. At 5:25 they passed within half a pistol shot, exchanging broadsides. The Englishman was severely hit in the hull. In the *Hornet's* tops one man was killed and two wounded.

As they cleared, the enemy put his helm hard up to come short around and rake with his other broadside. But Lawrence brought his ship around also, coming down on his antagonist's quarter a perfect blaze of fire. He held this position tenaciously, pouring in a terrific cannonade. The guns were worked so rapidly that they had to be constantly doused with buckets of water.

At 5:36, eleven minutes after the action began, the enemy struck her colors, immediately hoisting an ensign, jack down, as a signal of distress. Four minutes later the mainmast fell. She was found to be rapidly sinking, and while efforts were being made to save her she suddenly settled in five and a half fathoms carrying down three members of the *Hornet's* crew. She was the sloop of war *Peacock*, 20 guns. Her captain, William Peake, was killed.

Lawrence hurriedly made repairs fearing an attack by the brig. By 9 o'clock the *Hornet* was cleared and ready for action. At 2 a. m. he got under way northward under easy sail. On March 19, he anchored at Holmes's Hole, in Martha's Vineyard, and a few days later came through Long Island Sound to New York. His reward was the command of the *Chesapeake*.

Of this defeat—looking at it from the British side—a Halifax paper said:

"A vessel moored for a target could not have been sunk sooner than the *Peacock* by the *Hornet*. It will not do for British vessels to fight them single-handed. The Americans are a dead nip."

It was not long after this that orders went out from the British admiralty for its ships to cruise in pairs. Captains were given to understand that it would not be considered a discredit to avoid a doubtful engagement. Admiral Sir Charles Napier writing from Bermuda in 1813 said:

"Two packets are quite due and we fear they have been taken, for the Yankees swarm here, and when a frigate goes out to drive them away they take her. Yankees fight well and are gentlemen in their mode of warfare. These Yankees so much abused are really fine fellows."

Looking back on the war in 1817, he said in a letter to Lord Melville:

"The moment the American war broke out, we had to fight a navy better disciplined than our own, and we were defeated by superior force, it is true; but be it remembered, we were most severely punished without inflicting any great injury on our opponents."

It is true that in single engagements American ships were often superior in tonnage, number of guns, and men. Better gunnery, though, is what turned the trick for them, a superiority that our navy has maintained down to the present day. The old logs fairly bristle with such entries as: "Exercised the crew at the great guns today."

So much for the Indian cruise, as far as the *Constitution* and the *Hornet* are concerned. What became of the third member of the expedition, the *Essex*, is a story all to itself—one of the romances of naval history.

He Is Mexico's Thirteenth President

Concluded from page 13

leaving the few who really desire and are able to assimilate a higher education to pass on to the upper division schools. This is the plan which Calles and his advisers have announced they will follow.

Personally, the president-elect is a man of one idea and one job at a time. In his past career he has become noted for a determination to complete one task before embarking on another. Possibly this singularity of effort will handicap him as an executive, but it has helped him to rise from his youth on a Sonora farm to the presidency of Mexico while he is yet on the lee side of the half-century mark. He is a strong believer in American industrial and commercial methods, and, what is of possibly more importance to both Americans and Mexicans, the development of Mexico by properly controlled American capital, though there will be no more of the wasteful exploitation of Mexican resources which characterized the Diaz and Madero administrations.

The present congress of Mexico is composed of men of militaristic tendencies, senators and representatives who rode into office on the backs of the horses of the triumphant Obregon-Calles-De la Huerta revolution. Just how they will co-ordinate and co-operate with the presidency of a man who, though he has been a soldier, is not a militarist, is one of the question marks to be removed from the path of Mexican progress.

Maine's Great Battle of the Maps

An International Boundary Dispute Which Was Fought on Paper

By E. L. M'COLGIN

FEW Americans realize the situation the Maine boundary has created for Canada, and the trials of both countries attendant upon determining the present line. Ninety years ago the bloodless Aroostook war caused as tense a situation between Maine and New Brunswick as the Fiume disputes of Italy and Jugo-Slavia.

Happily Canada and the United States have found more profit in thinking and acting in terms of peace and mutual accommodation than in squabbling in the European fashion.

While the Maine boundary is awkward for Canada, the United States has somewhat made up for it in permitting the Canadian railways to be freely extended into the United States.

The Canadian Government itself now operates the former Grand Trunk lines from Montreal to Portland and to Chicago via Port Huron and Detroit, as well as a line into Northern New York. It is also the owner of the Central Vermont Railway.

The Canadian Pacific operates the short line from Montreal to St. John across the State of Maine. It owns the Soo Line which traverses Wisconsin, Northern Minnesota, and Michigan and most of North Dakota; also the Duluth, South Shore, and Atlantic, which serves the mineral region of Michigan.

Would Germany permit Russian railways to operate through from Moscow to Hamburg, or France agree to the Italian railways being extended to Paris? Spain would never consent to a French railway crossing the Pyrenees and on to Madrid. We order these things better in the New World.

Northern Maine juts up between the Maritime provinces and Quebec and almost severs their land connection. For a distance of seventy-five miles there is but a thirty-mile corridor between Maine and the St. Lawrence River. It only affords a long, circuitous route between Montreal and Quebec and St. John and Halifax, the alternative short route being across Maine.

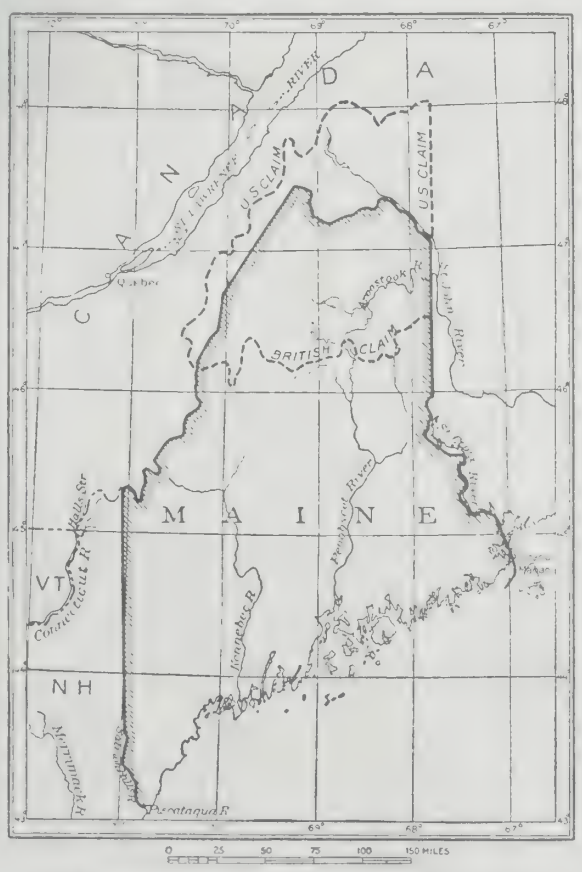
Since Montreal and the city of Quebec are icebound nearly six months in the year, their relation to open winter ports, especially national ones, is of prime importance.

Let Americans consider having their Atlantic port business diverted from New York to ports three hundred to eight hundred miles out of line and some of them in a foreign country, and they will understand our neighbor's problem.

There are two all-Canadian rail lines from Montreal and Quebec to St. John and Halifax, the Intercolonial and the newer Transcontinental. They were both built by the government and are now operated by the Canadian National. The Intercolonial mileage to St. John and Halifax is 734 and 800, respectively, while the Transcontinental line is 741 and 841 miles long. The Quebec city distance is 175 miles less than that of Montreal.

The Canadian Pacific short line which plunges straight through the eastern townships of Quebec and across Maine to St. John is but 481 miles long, 66 per cent of the distance of the all-Canadian lines. This gives St. John a distinct advantage over Halifax, 278 miles beyond St. John.

However, the nub of the whole matter is that even the Canadian Pacific railway line to St. John is 40 per cent longer than the 283-mile route from Montreal to Portland, Maine. The Grand Trunk's line to Portland was built more than a generation before the Intercolonial. While this was all very well when the Grand Trunk was privately owned and could bid for ocean business via Portland with only its stockholders to consider, trouble arose when the government took it over. Halifax and St. John have demanded that the Portland and Michigan lines be sold or at least that all ocean traffic be diverted to Canadian ports.



Map showing claims of United States and Great Britain.

While this is logical from the nationalistic viewpoint of these two Canadian cities and their provinces, the Canadian taxpayer is now meeting a deficit of fifty million dollars a year from the operation of the vast government railway system. The American lines are the only paying portions. Shall the taxpayers of all Canada lose this profit and also stand the new losses that would arise through carrying ocean business over the lengthy government lines to St. John and Halifax at rates that will attract the business?

Railway operating deficits do not frighten the Maritime provinces. The Intercolonial has been operated by the government at a loss ever since it was built in 1876 to bind the new Dominion and also to provide a military railway to the ocean.

The sixty-eighth article of the famous Quebec resolutions of 1865 provided "that the general government shall secure without delay the completion of the Intercolonial Railway from Riviére du Loup (on the St. Lawrence) through New Brunswick to Truro in Nova Scotia. This was the price Canada paid for the adhesion of these provinces to the Dominion. The British North American Act, the Canadian constitution, passed by the British Parliament in 1867, contained the same provision in Article 145.

The Intercolonial Railway was opened in 1876. While it was always overmanned by political appointees and a clear record of its financial results has never been available, it must be remembered that this much condemned railroad made a nation possible. To attract Montreal ocean traffic it had to offer rates comparable with the short lines to Portland, Boston, and New York. Boston is 451 miles from St. John by rail and there are passenger and freight steamers plying between Halifax, Yarmouth, St. John, and Boston over water routes of 375, 237 and 290 miles, respectively.

In 1886 the Canadian Pacific built its short line from Montreal to St. John. While it has an operating problem in crossing the Appalachian heights, it removed the possibility of the tenuous Intercolonial getting a large volume of through business. However, the Intercolonial serves a vast local territory and no private company would have embarked upon the venture. It is not comparable to the Canadian and American Pacific roads.

Some Canadian historians describe the definition of the Maine boundary contained in the American treaty of Independence as "an irretrievable blunder." The facts seem to be that the boundary is a fair one from a legal and historical standpoint.

Prior to Britain wresting Canada from France, which was confirmed by the treaty of October 7, 1763, Massachusetts, from which Maine was carved, claimed that her territory ran to the north bank of the St. Lawrence River and Britain never discountenanced the claim of her colony against France.

Britain becoming owner of Canada described its boundaries as she desired to fix them by the celebrated line of the highlands, the point about which subsequent disputes revolved.

According to the proclamation of the treaty of 1763 the line from Lake Nipissing was to cross the St. Lawrence and Lake Champlain in the forty-fifth degree of latitude and thence to proceed along the highlands which divide the rivers that empty themselves into the St. Lawrence from those which fall into the sea.

Massachusetts and England came to a gentleman's agreement. The Crown abated its claim to a tract of land near the Kennebec River, and Maine in return did not press her ancient boundary claim. The French maps down to 1763 showed the highlands as their conception of the boundary.

Richard Oswald, the wealthy Scotchman who negotiated the Treaty of Independence with Franklin, Adams, Jay and Laurens, had two principal objects: First, definitely to separate the new nation from France, and, second, to have the Americans assume responsibility for debts owed in Great Britain and to deal with the Tory or Loyalist claims. Aside from these things, Oswald was inclined to be generous. He once favored giving all of Canada to the United States. Oswald had many friends in America and had given £50,000 bail to secure Lauren's release from the Tower. Henry Strachey, under secretary of the British Foreign Office and formerly secretary to the great Clive, was sent to Paris to moderate Oswald's concessions.

Oswald and the British Government were long-headed in favoring Anglo-Saxons at the expense of France and Spain. The new nation shared Britain's desire to eliminate France and Spain from North America. When the American peace commissioners became convinced France and Spain were only interested in intrenching themselves in America at the expense of both their ally and foe, no time was lost in arranging a treaty with Britain which Franklin presented as a *fait accompli* to Vergennes whom he had agreed to consult.

In the treaty of 1783 the northern and eastern boundaries of Maine are described as follows: "A line drawn due north from the source of the St. Croix River to the highlands which divide those rivers that empty themselves into the St. Lawrence from those which fall into the Atlantic Ocean." The eastern boundary was the middle of the St. Croix from its mouth to its source then the above line to the highlands.

Oswald's treaty met with great opposition in Parliament. It was opposed on the very ground that it made a line of "boundary exceedingly inconvenient to Great Britain." One objector said it made the United States the master of Nova Scotia and New Brunswick, although those provinces have been very independent notwithstanding. The maps accompanying the Parliamentary papers showed the highland line claimed by the United States in subsequent disputes. However, this line ran entirely too far north for Canada's well-being.

International boundary marker on Maine boundary.

Almost sixty years elapsed before the Maine boundary was definitely settled in spite of the seemingly clear language of the treaty. Britain in objecting held less to the letter of the treaty than the effect of it on Canada, and she was justified to a certain extent.

It was not a strategic boundary, the military route to Quebec being up the Kennebec Valley. The territory was practically an unsettled wilderness, and Oswald had not haggled over western territory when making the treaty of 1783. He treated the United States handsomely.

In the winter of 1839 the lumbermen of New Brunswick and Maine came into frequent collision. The Maine legislature put $800,000 at the disposal of the governor for military purposes. As Webster says: "She fortified the line, or points on the line, to keep off intruders and to defend possession. There was Fort Fairfield, Fort Kent and I know not what other fortresses, all memorable in history."

Sir John Harvey, governor of New Brunswick, sent up two regiments with artillery and some bloodthirsty volunteers. Nova Scotia voted £100,000 and all her militia.

But London and Washington were not moved by their warlike governors. Canadians have never forgiven the London *Times* for suggesting that the fuss be ended by conceding the American claim and throwing in all of New Brunswick west of the St. John. The Canadians of 1783 had now reached a national consciousness. The United Empire Loyalists had made tremendous sacrifices for their king and country. It would have been well if London had included a Canadian in the negotiations, a point that was conceded in treaty-making years later.

The disputed territory was finally settled on a basis of 5,012 square miles to Canada and 7,015 to Maine. The St. John River was made the northern line and the St. Lawrence highlands only the northeastern line. Maine was also given the free navigation of the St. John River, and product floated down this river was treated as the product of New Brunswick in the provincial and British markets. Maine and Massachusetts obtained financial balm from Congress in $300,000 in equal portions.

Later it was claimed that a map approved by Franklin which indicated the boundary in a red line favorably to Great Britain had been withheld by Webster from the negotiations. Jackson had used this map to get Maine to agree upon the settlement basis he formulated.

However, Sir Robert Peel settled the question in Parliament by producing another map, *one which had not been supplied to Ashburton*, who had once declared the whole negotiations the *battle of the maps*.

On the map Peel now produced, the line as claimed by the United States is boldly and distinctly traced throughout its extent, and the words, "Boundary as described by Mr. Oswald," written in four places. Lord Brougham said in the House of Peers these words are in the handwriting of George the Third. This map had been preserved in the library of George the Third, and with that library was sent to the British Museum.

Four years later, when Webster was in the Senate, he delivered a masterly two-day speech in which he disposed of every objection to the Treaty of Washington, which he had negotiated.

In spite of her boundary troubles and the advantages gained from their settlement, Maine has neglected to produce an accurate state map. She has thousands of square miles which can only be safely traversed with a guide, since landmarks and maps are lacking.

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in the papers that the Armour business is getting ready to sell its packing interest to the people. This is the new method of "unloading." There is considerable irony in it. Here was one of the biggest and proudest of the monopolies, apparently invincible, but it disintegrated by its very bigness. If you make meat or any other commodity hard to get, people don't use so much of it, and you lose. That is what happened to the meat trust. It happened to the grain trust, too. In former years Chicago was known for these two monopolies—meat and wheat. Both have fallen. The big grain houses have—what do you think? They have resolved to sell out to the farmers! Unable to merge under the anti-trust law, they can merge by selling out to the farmers. Some of these grain companies have had hard sledding, too. It will be quite an accommodation if the public buys them. I hear that the farmers have not been in great haste to purchase stock in the merger of their former enemies (who still keep control, I understand) and it will be interesting to see how the Armour shares go.

I read in the papers (in *Zit's*, the theatrical newspaper, to be exact) that William A. Brady who is described as theatrical manager and fight promoter (I had never heard of his fight promotion) is tired of trying to produce decent plays. So tired, the report says, that he is producing his first bad play. The statements quoted as issued from Mr. Brady's office say that he has been "among the leaders in the movement for clean plays, and that he has for years seen his beautifully directed, cleverly acted, well-written plays with a high moral standard go to smash on the rocks of public demand. His futile attempts to make money and, at the same time, keep his plays creamily white to suit the few that crave things of purity, are matters of national record." Analyze that statement and you will find it putrid, not morally but intellectually. The mind that evolved it doesn't know what the controversy is about. If it is the same mind that directed the production of the decent plays "to suit the few who crave things of purity," no wonder they failed. There could scarcely be anything more indecent in a stage portrayal than there is in that statement. For here is the unloveliest thing of all, a bad mind. It is a safe prediction that the "bad play" will be just as big a failure as the others. Of course, the whole matter savors more of an imitation of David Belasco's slump than of anything else. It is too bad that both Belasco and Brady chose to wind up their careers by throwing a wad of nastiness in the face of the public.

I read in the papers that President Emeritus Eliot has revived the question of "race suicide." Of course, there is no such thing. There may be family suicide; a man or woman may say, "The race gets no farther through me," but it only prevents the founding of another family; it does not affect the race at all. Races die out, but not by their own intention. The races that have died out were not the ones that practiced race suicide, but quite the reverse. As to the present case, it is probably just as well that those who won't have children don't have any. The more one sees, the more one regards it as a blessing to the race that some people are voluntarily childless. There are some qualities that might just as well die out. Roughly, the type of mind that will accept Mrs. Sanger as its guide is favoring the race by refusing to repropagate itself. Let them die out. Of course, there is another side: the organization of modern life that takes no account of children. They are simply ruled out. An alien twist to our civilization has struck indirectly at the American family. The family now means a certain money standard, housing, economic security. Where wife and husband both work that they might live in a cubby hole seventeen flights up, the same being owned and rented by a man whose name ends in "stein," the family is next to impossible. If I were a young man there are two things I'd do certain sure: I'd live in my own detached house (not an apartment) and I'd make all the living that was made. Getting matters back on a normal basis, the family question would solve itself. But as to race suicide, there is always hope. T. R. preached strongly, and you have read in the papers the good news about the charming Princess Alice.

I read in the papers everywhere nowadays confirmations of the statements for making which THE DEARBORN INDEPENDENT was denounced two or three years ago. It is a striking instance of truth rising from the dust—if you can wait long enough. The London *Times* is the latest to endorse THE DEARBORN INDEPENDENT's view of Russia. I was interested to read the *Times'* report of Mr. Stephen Graham's address in All-Hallows, London. He said: The promoters of the Russian revolution had in view the complete destruction of Christianity and its moral code. The ikons and the sacred vessels of the churches had been confiscated and were now being sold as religious curios in Paris and America. No one was admitted into the Russian Communist party who did not deny God. Evil is enthroned at Moscow. It is a domination not from within, but *from without.* It was *a foreign domination* from which Russia was suffering. *The promoters were not Russians.* Two of the three chief revolutionary leaders at present are *Jews.*

Of course we knew this all the time. The program of the revolution was outlined in the so-called Protocols, and was followed to the letter. The whole financial upset of Europe was foreknown and preorganized. There is, historically speaking, no Russian Revolution. There is the subjugation of Russia by international Jewry. Everybody admits it now.

MR. FORD'S page discusses the relative chances of the city-bred and country-bred boy for success.

WHY did Massachusetts vote against the Federal Child Control Amendment? Some say money; some say the Catholic church; some say selfish employers. But what are the facts? You may want them for your own state. Or to make up your own mind. (p. 4)

HE CANNOT remember the names of his books, and he hates to sit down and write, yet he is a most popular novelist; and one of our friends inveigled him into talking about himself. (page 3)

WHAT is the difference between dumping 60 per cent of a great productive estate into the sea, and dumping it into one Federal and forty-six state treasuries? Can you bleed a horse at each of its four legs and expect him to win a race? When taxes have become so high that people take out insurance against them as they do against death, what's the answer? A big vital discussion. (p. 2)

Baseball thrills—the Big Ones. (p. 15)

"NO," WE have frequently said to MSS. concerning Stevenson's resting place at Samoa, "we don't want anything but first-hand information from the spot." So Mr. Calnon went to Samoa and climbed Vaea Mountain and saw Vailima, and talked to men who knew "R.L.S." Altogether an article to interest the lovers of Tusitala. (p. 5)

The romance of the cartographer—mapping America. (p. 13)

YOU can read so much of routine writers that the total result is only a little confusion added to a former blissful innocence. The Oklahoma oil excitement, for example. Here is a story that just about tells it all, and tells it with "the visiting mind"—as you yourself would see it if you were there. No routine stuff, all live facts. (p. 6)

"Briefly Told" (p. 16) is concentrated wit, wisdom, travel, fact, fancy, and novelty.

"I'M TRULY sorry man's dominion has broken nature's social union," said Burns to the field mouse; but the union is being repaired; the animals are trending toward greater confidence in man. How they are doing it is told on page 11.

UNCLE SAM is an enormous tenant, rented quarters costing nearly two million dollars a year in Washington, and the Post Office Department pays more than eleven million dollars a year in rents. (p. 10)

DOROTHY OSBORNE sat by the fireside in 1653 and heard her brother and "Mr. Gibson" talking about the possibility of men flying. Dorothy also had a love affair. (p. 9)

Should Inheritances Be Halved?

Dumping 60 Per Cent of Productive Business Into the Sea of Taxation

By ALLAN L. BENSON

BAD laws hurt everybody. Why are there so many bad laws? Because legislators who do not know what to do so often do it. If they would do nothing until they knew what to do they would do less harm and more good.

What are we talking about in particular? The inheritance tax laws. There are forty-seven of them. Each of forty-six states has one and the National Government has another. These taxes sometimes take as much as 60 per cent of an estate.

Why are inheritances taxed? That is just it. Why *are* they taxed? They are taxed because we have in this country a considerable amount of discontent among the people and an enormous amount of economic ignorance among our legislators.

The people are and long have been discontented because of the great inequalities in the distribution of wealth.

It is the business of a politician to capitalize whatever he knows to be in the minds of the people back home.

If it be discontent, because of the coexistence of great wealth and great poverty, the politician knows what to do. He puts something in his platform about his intention, if elected, to put a crimp in wealth. This is what old Tom Platt of New York used to call "yielding to public clamor." Tottering Thomas always thought it was a crime for a public servant to pay any attention to those who elected him.

Representing a Wave of Discontent

All of our inheritance tax laws represent the wave of discontent dashing against the solid bone frontispiece of the Democratic party. The wave began to roll heavily in the years immediately following the Civil War. The Democratic party was out of power. It wanted to get back. Listening to the rumbling in the sticks, it saw that votes might be obtained by making promises to "do something" about the inequalities of wealth.

These promises took the form of pledges to tax incomes and inheritances. The gentlemen who made these promises had no more idea of what they were promising than potato bugs have of the chemistry of the soil. All they knew was that they were doing something to put the Republicans in a hole. They had a vague idea that such types of taxation represented approved forms of social legislation, tested and tried in England for the purpose of leveling down the rich for the benefit of the poor.

In other words, these gentlemen were equipped with nothing but misinformation. They did not know that when England, in 1801, first taxed incomes, she taxed them, not to remove inequalities of fortune, but to get money for her navy that she had been unable to raise in any other way. Napoleon was across the channel swinging a mean sword. England was frankly afraid of him. She had raised every dollar she could by old methods of taxation to strengthen her navy against him. And, when she still felt insecure, she began to tax incomes, with no other purpose behind the tax than to increase her defenses. To this day, English incomes are not taxed for any other purpose than to raise money to carry on the government.

Nor did these Democratic gentlemen of a generation ago know that British inheritance taxes are aimed, not against wealth as such, but against great holdings of land. It is one thing to accumulate a lot of money and quite another, in a little place like England, to accumulate a lot of land. Human effort can create money, but no amount of human effort can appreciably increase the amount of land in England. When seven men own most of the land upon which London is situated and a few others own a large part of the country, there is bound to be a shortage of land for the rest of the people. The English felt this shortage and compelled the taxation of inheritances, hoping thus to break up the great landed estates. As a matter of fact, the great landed estates are being broken up. The process is going slowly, but it is under way.

Industries Must Not Be Starved

Now we have in this country no great landed estates to break up, and the inheritance tax laws enacted by our states were designed to effect quite different purposes. Their general purpose was to do something toward the removal of the inequalities of wealth. This was to be brought about, first by breaking up great fortunes in their transit from one generation to another and, second, by compelling the well-to-do to pay more of the cost of government, the inference being that the poor would thus be enabled to pay less. This inference was, of course, wholly unjustified. American government was never a heavier burden upon the poor than it is today. Since it is in the nature of politicians to spend all they can get, the poor can never be helped by taxing the rich.

Yet this propaganda of the inheritance tax, put forth for no other purpose than to get a party back into office, made headway. For self-protection, the opposite party in many quarters, had to indorse it. As a result, forty-six states imposed taxes upon inheritances, the rates usually beginning at 1 per cent and rising, according to the size of the estate, to about 10 per cent.

During the war, the United States Government also enacted an inheritance tax law which takes as much as 40 per cent of large estates. Where an estate has possessions in many states, the heirs are required to pay taxes to the National Government and to each of the states in which they have property. Sometimes the home state of the heirs demands, in addition to its own tax, a sum equivalent to all the taxes paid by the estate in the other states. As stated, the various inheritance taxes sometimes eat up 60 per cent of an estate.

Now let us see what we are trying to do in this country and then see whether the inheritance tax laws are likely to help us do it.

Let us first inquire whether we are trying to destroy the system under which wealth in this country is produced. As I interpret the election returns that come in from time to time, we are not trying to destroy this system. Yet the tendency of the inheritance tax laws, taken in conjunction with income tax laws and other forms of taxation, is to destroy our present system of wealth-production without creating any other system to take its place. In other words, it seems to me as if the tendency of the inheritance tax laws in particular is to make the carrying on of every kind of fundamental business increasingly difficult, with the burden always resting heavily upon the people.

What kind of a system of industry is it upon which we depend to supply the necessities of life and such luxuries as we can get? Is it not a system under which industries are privately owned and privately operated? Is it not essential, for the development of the country, that great sums shall be invested for the development of water power, the operation of mines, the maintenance of railroads and a thousand other similar things? Is it not plain that industry cannot keep abreast of human needs unless such investments are made? If the great sums that should be expended for the development of the country were, instead, to be dumped into the sea, is it not plain that this and unborn generations would suffer?

Now what is the difference between dumping 60 per cent of a great estate into the sea and dumping it into one national and forty-six state treasuries? What do our state and national governments ever do that gives productive employment to man, woman, or child? They do a little useful work in digging up scientific information that is of use to workers, but what do the national and state governments do to create useful jobs for others?

Taxation Is Killing Enterprise

Is it useful work to belong to the great army of tax-eaters who feed at the public crib?

Is it useful work to build battleships that scare other nations into building battleships which, in turn, scare us into building still more battleships, thus starting a whirl around a bloody circle that means poverty while it is going on, eventually war, and then more poverty than ever before?

Aside from the costs of necessary government—which are small—what do our governments do with the great sums that we dump into our state and national treasuries—what that is worth to us the money that it costs?

You cannot bleed a race horse at each of its four legs and expect it to continue much longer as a race horse. If the people of this country wish its industries to be owned and operated by private individuals it is only common sense not to bleed them pale while they are alive and stage a great grave-side scene when they are dead.

It is conceivable that the business of this country might be carried on without private management, but it is not conceivable that it can be carried on without any management.

Unfortunately, our present taxation laws are killing private management without building up anything in its place.

I do not mean that excessive taxation is closing any industries, though if long enough continued it will close them. But it is making unduly high the cost of doing business. Expensive business means costly product. Costly product means fewer customers. Fewer customers mean a diminished market. A diminished market means less work and more enforced idleness on the part of the workers. Less work and more enforced idleness mean—when endured as long as human nature can tolerate them—fireworks, French and Russian revolutions, death and destruction.

No nation is rich enough safely to permit from 30 to 60 per cent of each generation's accumulated capital to be diverted from productive industry to the sandlots of governmental extravagance and waste.

We do not yet realize what these outrageous tax laws mean because they have not been long enough with us. The National Government's 40 per cent inheritance grab dates only from the war. Let that law and its forty-six ferocious young assistants get to work on a large estate and the estate would have lost more than half of its substance. Two deaths within a short period would practically take everything. A great industry might be lost to its heirs and its ownership split up among outsiders. For income tax laws demand *cash*. Great estates consist of all kinds of *properties*. They would have to be *sold to get cash* to be dumped into the sea.

Few persons realize the extent to which wealth which should be devoted to the development of the country's resources for the public good is being confiscated by excessive taxation. The following figures are official:

In 1922, agricultural corporations and allied industries paid 86 per cent of their profits as local, state, and Federal taxes. The remaining 14 per cent will be taxed when inheritance taxes are due.

In 1922, mining and quarrying corporations paid taxes amounting to 62 per cent of their profits. Hotels and theaters paid 40 per cent. Transportation and public utilities paid 37 per cent. Banking and insurance paid 32 per cent.

These interests, too, will later have to settle with the inheritance tax collectors.

Where do we think the business interests of this country get their money? Do we not know that they get it from us? Where else could they get it? And when the tax collector gets it, does it come back to us? Who has ever seen any of it come back? What folly, then, for us to permit governments to make the carrying on of business almost prohibitively expensive! We are not alone taxing ourselves to provide money for our legislators to waste, but we are hamstringing the interests upon which we depend, not only to carry on industry, but to bring the country's resources in ever greater measure to the country's needs.

Tax Collector Gets and Keeps It

We should do one thing or the other: We should facilitate in every reasonable way the operation of the present system of industry or we should install another system. The people have said over and over again that they do not want another system. That may not be the final word, but it is the present word. Why then make life increasingly difficult by acting as if we were in favor of no system? If we destroy what we have without making anything to replace it we shall have no system.

I know of no interest that is profiting from the present inheritance tax laws except the life insurance companies. If one wished to use a common phrase he might say that the life insurance companies are certainly "sitting pretty." A high official of one of the largest eastern companies told me that his company wrote more business during the first week of 1925 than it wrote in the entire year of 1908—and it was one of the largest companies in the East in 1908. Before inheritance taxes came along to grab what the dead left, life insurance agents used to have to hustle. Now the head of an agency could live in comfort and ease if he did no more than to keep his office open to handle the brokerage business that comes to him from other companies. A recent case will serve as an illustration of what is meant by "brokerage business":

An agency manager's phone rang and he was asked to tell how much insurance his company would issue on the life of a woman 52 years old. He, of course, had to refer the inquiry to his home office, but what was in the air was this: A woman 52 years old had made application to a certain company for all the life insurance that she could get in all of the companies in the United States. In this matter, she asked the company to whom she applied to act as her agent in getting insurance from the others.

Life Insurance Becomes a Problem

What she was trying to do was *to get enough insurance, if possible, to pay her inheritance taxes so that when she died her heirs would get a sum equivalent to her actual estate.*

Insurance companies do not risk too much on the lives of women and, in this case, I believe she was able to get, from all the companies in this country, only about $1,200,000, which, by the way, was not enough to make good what the inheritance tax collectors will eventually take from her estate.

Life insurance has become a very real problem to those who would do whatever they can to make up for the inroads upon their wealth that they know will be made by the inheritance tax collectors. Unless advance arrangements are made there is likely to be a first-class jam, because *the collectors demand cash within a year.* The Woolworth Estate, so I am informed, had to mortage the Woolworth Building for half its value to get money to pay inheritance taxes.

If each generation were to *burn* 60 per cent of its accumulated capital, the loss to the nation would be about what the loss will be if the present inheritance tax laws are permitted to stand.

We are told that present excessive taxation is necessary to defray the necessary costs of government. This is not true. We are taxed dangerously high because our city, state, and national govern-

Great Novelist Who Hates Writing

E. Phillips Oppenheim Chats About His Methods and His Aspirations

By W. TEIGNMOUTH SHORE

ONE dull November morning I walked across the Green Park to visit E. Phillips Oppenheim, Master of Mysteries, at his chambers in Clarges street, Mayfair, which is the hub of London society.

I love these Old-World London names! Mayfair, so called after the annual fair that was held here each May in a field nearby this very street. Having become a center of riot and disorder it utterly vanished in the reign of George III. Clarges street itself goes fairly far back, more than two hundred years; among the remembered dwellers therein having been Nelson's Lady Hamilton.

With such thoughts stirring in my mind I arrived at my destination. Then upstairs to a cozy room and a warm welcome.

It is in human nature to form a mind-picture of anyone whom we are going to see for the first time; which portrait is usually grotesquely wrong. This Master of Mysteries—surely he would be tall, slim, dark, black-eyed and black-haired, with an intangible air of deep-laid plots and sinister crime around him, an unsaintly halo. All that he certainly is not! A genial, kindly man of middle age; eyes and lips full of fun; a breeziness of speech and manner such as one looks for in a well-to-do country gentleman.

I sat me down in a very comfortable armchair, and embarked upon as vagabondish a conversation as it has ever been my fortune to take a share in. We wandered from subject to subject just as bees buzz from blossom to blossom; but it was I who did all the honey gathering.

I asked mine host why he lived most of his time in the country, or at any rate away from London—why did he come here so infrequently—why did he come here at all—why—?

"I enjoy the contrast," he answered. "The spice of life in London is jolly and exhilarating after the quietness of the country. I run up here from Reepham now and then for two or three days, and enjoy them thoroughly. After all, variety is essential to enjoyment, isn't it? I've a nice old country house—not a mansion—not so big as it looks in that photo—but big enough. It's built in Tudor style and has a lot of nice old oak in it. You can buy houses like this cheap enough nowadays; people funk the cost of upkeep. But we live simply and quietly. What do I do with myself in the country? Well, in the summer I play golf and tennis; but this time of the year's best for me, I love shooting. I'm out with my gun all day; then in at about four in the afternoon to tea—then work, often till pretty late at night."

We drifted into book talk:

"No, I don't run after first editions; I love my books for what's inside them. About the only collector's treasure I have is a four-volume edition of Laurence Sterne, which belonged to Charles Dickens and was in his library at Gad's Hill. Yes; I manage to get through quite a lot of reading."

"When I'm not in the country or here," he said in answer to a question from me, "I'm down in the Riviera, where I've a small villa; I generally go there at the beginning of the year and come back in the spring—sometimes later. I've built a summer house in the garden there, looking over the sea, where I do my writing."

"Do your writing," I exclaimed, hot as a detective on the trail. "Tell me how you write your stories. Do you work out a detailed plot first and then clothe it?"

"No; I can't do it that way. I can't work out my plots before starting to write. I never hatch them out, so to say. An idea begins to haunt me—an atmosphere develops—characters begin to shape themselves. Then I boil over and begin to write. The story seems to work itself out. I don't hunt for ideas—they just come along. Pen? No, I dictate all my stuff—I hate *writing!*"

"How did you come to take up story-telling?" I asked. "Felt born that way?"

"That's about it. It was my ambition from the first. My father was a clever story-teller—never printed anything, though. When we were small children he made us each write a story on Christmas evening—he wrote one himself—they were read out and we voted as to which we liked best. My father always won. NO! We were not allowed to vote each for himself! I shall never forget my father's face of astonishment when one Christmas I won the prize! I was only thirteen. I was quite considerably pleased with myself!"

"Does your work take it out of you?"

"By Jove, it does. Imaginative work must, if it is to be any good. I live in each story and with all my characters. I feel their emotions, get excited with them, angry, anxious, happy, miserable, and so on. The whole family knows it when my hero or heroine is in trouble. What's that? Yes, I do find my characters take the bit in their teeth and act for themselves. As I've told you, I cannot plot out my stories. I tried to twice, and failed both times. Once was making a film drama into a novel, and the other a play. It didn't work, and I'm not going to try it again."

"You've written quite a lot of books—how many?"

"How many is it?" he asked his secretary, who was kindly aiding and abetting me in my nefarious examination—"What? Eighty-six? And six serial stories that haven't yet got into volume form? Ninety-two!"

"Do you ever draw your characters straight from life? Portraits?" I asked.

"Never. I don't think I could and if I could I wouldn't. Characters are built up; not mere reproductions. They are composite portraits; a bit from here—a mannerism from there—and so on."

"Then I needn't fear your taking me for one of your villains?"

"No. But I won't promise not to make you part of a hero."

"That's far worse than being a whole villain!" I expostulated. "A slander! Heroes are generally so stupid that they haven't the brains to be wicked, if they wanted to. I shall sue you for damages, if you do!—Been to America often?"

"Often? I don't know whether you call fifteen times often? The first time I went to marry; the other times for pleasure."

"That's a nice thing to say," I laughed. "I shall tell Mrs. Oppenheim—let her know that the *other* times were for pleasure!"

"Tell away! Next visit? I've promised my American publishers to go over when my hundredth book comes out. Kind of centenary celebration! I rather fancy they're trying to make it next year! . . . . Their newspapers? Aren't they amazing? I was told that the amount of reading matter in one of the large Sunday editions is much more than the length of my longest story."

"Short stories—?"

"I do a good many. Never single ones. Either Conan Doyle or myself, I don't know which, was the first to start the fashion of writing a series of short stories round a central figure or a set of characters. Sherlock Holmes is the biggest detective in fiction, I think. Fresh and clever. I've drawn a good many detectives, but never taken the personality of a real one. I've no right to steal a man's character, have I? English detectives don't look their parts a bit.

"I suppose you've committed all sorts of crimes yourself, so as to get the right atmosphere?"

"No, I have *not*. I've often felt tempted to, but the penalty for any crime worth while is so outrageously heavy that I've had to confine myself to quite minor offenses. I'm afraid the police would not take my explanation that I was simply conducting scientific experiments if I robbed a jewelry store or insured someone and then took steps to facilitate his departure to another and a better world. But I am rather proud of one offense I committed. *I am the man who legalized poker in this country!* The police said it was a game of pure chance. Like *chemin de fer* or dice. It was illegal to play it in any club, hotel, or public place. So after warning the police that we were going to do it, some other members of a certain card club and myself played poker! The club was raided. We were arrested! Had us up before the magistrates and were fined £50 each. But we were out for a fight. I wrote ferocious letters to the newspapers. We played again! Were again arrested! But—not fined! This time we won our case, succeeded in proving poker to be a game of skill. I offered to play the police for all they were worth—but they weren't taking any. Now poker is played at very nearly every club. So I feel that my career as a criminal has not been altogether undistinguished."

"Returning to America—I believe they sometimes play poker there?" I said. "Tell me some of the things you particularly like in their way of living over there?"

"Lots of things. I particularly delighted in the country clubs. Jolly to go down to one of them for the day—for several days—golf or tennis—back to the clubhouse—a delightful bath, change of clothes. Then dinner on the piazza—moonlight—" He blew a ring of smoke into the air—it seemed to hold for him pictures of past delights.

I cruelly brought him back to myself—

"Theaters? Of course, I love them," he answered. "I don't know that I much care about revues or musical shows. I do like a good, strong gripping drama. I wish I could remember—but, do you know, I've an awful memory—awful—can't remember the names of my books or a single line I've written."

"Others don't forget them," said I, and then "Goodby."

E. PHILLIPS OPPENHEIM and Reepham House, Norfolk.

The following excerpt from "The Profiteers" will be recognized as typical of Oppenheim's virile, realistic style:

"THE PROFITEERS"

In the "Profiteers" old Dreadnought Phipps, a financial giant, finds himself in conflict with John Philip Wingate, who has threatened to break him. The following passage will illustrate Oppenheim's style:

"Phipps did his best for peace. This was his enemy with whom he was now face to face, but the final issue was not yet. He spoke suavely and persuasively.

" 'Come, come,' " he said, " 'Wingate, you have changed since you and I fought our battles in New York and Chicago. Today you seem to be representing a very worthy and misguided class of the community—the sentimentalists. They are invariably trying to alter by legislation conditions which are automatic. It is true that our operations over here may temporarily make bread dearer, but on the other hand we may be facing the other way within a month. We may be sellers of wheat, and the loaf then will be cheaper than it has ever been. I am an Englishman, and it is not my desire to add to the sufferings of my fellow countrymen.'

" 'You don't care a ——— about any one's sufferings,' " Wingate retorted, " 'so long as you can make money out of them.' "

Why Massachusetts Beat Child Control

New England Parents Believe They Can Manage Their Own Children

By MARGARET C. ROBINSON

The fathers and mothers of the State of Massachusetts believe that they are better qualified to judge of what tasks their children under eighteen years of age are capable of performing in the home or on the home farm than the Children's Bureau at Washington, which defines the washing of dishes and the collecting of hens' eggs as "Child Labor."

ON NOVEMBER 4, the men and women of Massachusetts were given an opportunity, under the People's Opinion Law, to express their opinion as to whether the Massachusetts legislature should ratify the so-called Child Labor Amendment. The result of this referendum to the people of a question touching not only their fundamental constitutional rights, but so intimate and personal a matter as the control and education of their own children, is of interest and value to the whole country.

At the beginning of the six weeks' campaign for and against the amendment, public opinion was favorable to the amendment, on the strength of its name alone. Any measure for the removal of harmful conditions of child labor wins immediate sympathy in Massachusetts, which has always been a pioneer in good child labor legislation. But as the campaign of education went on, and the people began to realize that the amendment contained *an enormous new grant of power to Congress*, such as no government in the world exercises outside of Soviet Russia, and as the full significance of the text of the amendment ("Congress shall have power to limit, regulate and prohibit the labor of persons under 18") began to be understood, a tremendous change in public opinion set in, until on November 4 when the vote was taken 241,461 men and women voted for the amendment and 697,563 against it. This is the largest majority ever given on any question submitted to the people of Massachusetts.

People Could Not Be Deceived

What are the reasons for this tremendous defeat of the amendment in a progressive state like Massachusetts, which has always stood in the forefront of Child Labor Reform?

The advocates of the amendment, who are very bitter at such an overwhelming defeat at the hands of the people, say that the people were deceived.

Were the people deceived? There were certainly many barefaced attempts to deceive them. They were told, for instance, by advocates of the amendment, that little children of six and eight worked long hours in the southern mills, and that the South has no restrictive child labor legislation. The fact that every southern state forbids child labor in the mills up to the age of 14 was carefully concealed.

They were told that in Georgia little children could work all night in the mills. No child under 14 years and 6 months can work in the mills in Georgia after 7:00 p. m. or before 6:00 a. m.

They were told that 89,000 children under 15 are working in the mills in Georgia. The actual number is considerably under 300.

They were told that almost no states prohibit child labor at night. The fact is that almost all states do prohibit it.

They were told that no Socialist had anything to do with drafting the amendment. The fact is that a woman who had much if not most to do with drafting the amendment—Mrs. Florence Kelley—is a member of the Socialist party, ex-president of the Intercollegiate Socialist League, and lecturer at the Rand School of Socialism.

But—and here's the rub!—*these attempts to deceive the people were not successful*, and what is more, they acted as a boomerang. The people decided that there must be something radically wrong with a measure whose advocates felt it necessary to resort to such easily disproved statements as these, to make out any sort of a case. Hence they voted overwhelmingly against it. *The people were not deceived!*

Refused to Swallow the Bait

Early in the campaign the advocates of the amendment attempted to secure the support of Massachusetts textile manufacturers by an appeal to their self-interest, in the form of an assurance that the amendment would eliminate hurtful competition with southern mills. Knowing that child labor in southern mills is today a negligible quantity, and that it is lower taxes, lower wages for men and women, due to lower cost of living, nearness to the cotton fields and to soft coal mines, and so on, which makes the South a formidable competitor, the Massachusetts manufacturers refused to swallow the bait. It is evident that the advocates of the amendment had expected great results from this appeal, and their bitterness against the manufacturers is accordingly great.

In revenge they are circulating all over the country statements that Massachusetts was flooded with money by the manufacturers to defeat the amendment. Is this true?

To those who know the facts and who worked hard to help raise money needed for printing, speakers, advertising, and so on, this statement is ridiculous and worse. The money spent by the "Citizens' Committee" which conducted the campaign was about $16,000, which came from 800 contributions, averaging $20 each. The smallest contribution was 25 cents from a working woman. The largest individual contribution was $200. The Massachusetts Public Interests League, an organization of public-spirited women whose platform is "to defend the Constitution of the United States, to oppose bureaucratic and socialist legislation, and to aid in furthering causes which are of importance to public welfare," raised several hundred dollars for the work of the Citizens' Committee.

Another charge made by the defeated party is that the amendment was defeated by Catholic influence.

Did the Roman Catholics defeat the amendment? Undoubtedly many Catholics did strongly oppose the amendment. Catholics will always oppose measures which threaten to undermine, weaken or destroy the institution of the family! But it is to be noted that at the same election on November 4, a Catholic candidate for Governor of Massachusetts was overwhelmingly defeated; that not only in the cities like Boston and Fall River, where there is a large Catholic population, was the amendment defeated, but in towns where there is not even a Catholic church; in fact, in every precinct in the state there was a majority against the amendment! Certainly no unprejudiced person can attribute such political power to any one organization in Massachusetts, even to the Catholic church. Another thing to be noted is that Georgia is as strongly opposed to this amendment as Massachusetts, and Georgia is the stronghold of the Ku Klux Klan, whose chief *raison d'etre* is popularly supposed to be antagonism to the Catholic church. Some other explanation must be sought for the overwhelming victory in Massachusetts.

Bishop Lawrence, head of the Episcopal church in Massachusetts, Rev. A. Z. Conrad, one of the leading Congregational clergymen of the state, Rev. J. M. Shepler, presiding elder of the Methodist church, and other distinguished clergymen, stood with Cardinal O'Connell in opposing a measure which proposed to place 40,000,000 children and youths in the control of Congress.

The Campaign Has Its Amusing Side

The heads of our two greatest educational institutions, President Lowell of Harvard and President Stratton of the Institute of Technology, joined the Citizens' Committee for opposing the amendment.

Several of the ablest members of the Massachusetts Child Labor Committee, who have worked for years and with great success to improve child labor conditions in Massachusetts joined the opposition to this amendment, because they believed it to threaten serious evils to American youth.

Joseph Lee, president of the Playground and Recreation Committee, known throughout the United States for his long years of devoted service to the welfare of childhood, was a strong opponent of the amendment.

Who will say that these gentlemen were "deceived" concerning the amendment? And what are his intellectual qualifications for making the decision?

A feature of the campaign which has its amusing side is the worthlessness of "indorsements" of this amendment by organizations. Over and over again we were told of the many powerful organizations, especially women's organizations, which had indorsed it. But when election day came social workers, members of the churches, of the Y. W. C. A., teachers, and club women by the thousand voted against it in spite of the indorsements of these organizations. A former officer of the Massachusetts Federation of Women's Clubs says that not a single club woman of her acquaintance voted for the amendment!

Massachusetts has 966,000 women over 21 years of age. The fact that the combined vote of men and women for the amendment was only 241,461 shows what a small proportion of women favored it.

Why were the men and women of Massachusetts so strongly opposed to the amendment? For the same reason that the people of every other state will be against it if they inform themselves of its true nature. Representative Isaac Foster, of Ohio, who sponsored the amendment in the House of Representatives (and who was in consequence defeated by his constituents at the primaries) admitted that *to submit this amendment to a convention elected by the people for the purpose would mean certain defeat for it!*

The advocates of the amendment will do their utmost to prevent the people of other states from being allowed to vote on the question. They prefer to have it left to state legislatures, trusting to their powerful and experienced lobbies to control the legislators.

One of the things which aroused the suspicions of the people of Massachusetts early in the campaign was the reiteration of the propagandists that the amendment *did not mean what it said*. They were vehement in declaring that it did not mean this, or it only meant that. Fortunately the language of the amendment is so very clear and simple that the voters (who are able to read, since we have a literacy test for citizenship in Massachusetts) felt competent to judge of the meaning of the words: "Congress shall have power to limit, regulate and prohibit the labor of persons under 18 years of age." They inferred that it meant what it said, and voted accordingly. In this judgment they are supported by a decision of the Supreme Court, which said:

Full Power Over the Thing

> "The framers of the Constitution must be understood to have employed words in their natural sense, and to have intended what they have said; and in construing the extent of the powers which it creates, there is no other rule than to consider the language of the instrument which confers them." (Gibbons vs. Ogden, 9 Wheat, 188)

Another decision of the Supreme Court is of importance in connection with this amendment: "The power to regulate implies in its nature *full power over the thing to be regulated.*" This certainly gives food for thought when the thing to be regulated is the labor of persons under 18.

Congressman Ramseyer, of Iowa, *who voted for the amendment*, said:

> "Mark right here, too, it does not say the 'employment' of persons under 18 years of age, but the 'labor' of persons under 18 years of age. * * * A boy who is sent by his father to milk the cows labors. Under the proposed amendment Congress will have power to regulate the labor of a boy under the direction of his father as well as the employment of the same boy when he works for a neighbor or stranger. * * * Congress will have the power to 'limit, regulate and prohibit' the labor of girls under 18 years of age in the home and of boys under 18 years of age on the farms. Gentlemen admit that the effect of the proposed amendment is just as I state it."

The people of Massachusetts resented the attempts of the advocates of the amendment to deceive them as to the meaning and scope of the amendment.

They are not ready to line up with Russia in turning over the labor and education of the young to centralized control.

They believe that the states, which have done so much to improve child labor conditions, are more to be trusted for a continuation of the good work, than a Socialist Bureau at Washington, hundreds or thousands of miles away. That Federal dictation to the states is not needed is proved by the fact that since the second Federal Child Labor Law was declared unconstitutional twenty-two states have improved their laws for children.

Not Ready to Line Up With Russia

The people of Massachusetts believe that the average parent is a saner judge of what labor his child under 18 is fitted to do in the home or on the home farm than the Children's Bureau at Washington, which lists as "Child Labor" such tasks as washing dishes, hunting eggs, making beds, caring for younger brothers and sisters, and so on.

In short, they believe it about time to defend their fundamental constitutional rights from further encroachments and to reserve for themselves such intimate and personal matters as the control and education of their own children.

"He Lies Where He Longed to Be"

Robert Louis Stevenson and His Tomb on the Lonely Hill in Samoa

By WILLIAM LEE CALNON

Apia, British Samoa, via Pago Pago, American Samoa—

ROBERT Louis Stevenson, one of the world's best-loved men of letters, and certainly the best-loved white man who ever lived in the South Seas, lies at rest in one of the world's strangest tombs—a majestic hilltop four miles out of Apia. With him now are the ashes of his wife, brought here from the United States a few years ago, according to her wishes.

Apia is an out-of-the-way port, as ports go in the South Seas. A small ship runs every three weeks to Pago Pago to connect with the passenger ships to Honolulu and San Francisco, to the north and east, and to Sydney, Australia, to the south. Another runs via Suva, in the Fiji Islands, to connect with the British lines to Vancouver, British Columbia, and goes on to Australia and New Zealand. Some tramp steamers and sailing ships make it a port of call.

Above—Tomb of Robert Louis Stevenson, near Apia, British Samoa. Below—R. L. Stevenson's "Requiem," as engraved on tablet on his tomb.

But the fact that it is off the main routes of travel does not deter hundreds of tourists annually from visiting Apia, drawn thither by the desire to view the tomb of Stevenson. Practically no one ever comes to Apia without making this pilgrimage, though it is an arduous one even after Apia is reached.

The tomb stands on a small flat space atop the great hill which Stevenson faced as he sat at his writing before a window in his home more than a thousand feet below. His oft-expressed wish in life was that he be buried there if death came to him while he was in Samoa. The wish was carried out, but it is hardly possible that it would have been carried out if made by any other man than Stevenson, who had won the ardent love of the Samoans, high and low.

To lay him at rest in his chosen spot the natives cleared a pathway straight as an arrow up the mountain, being compelled to pull themselves and the casket up by means of ropes at times, so steep was the ascent. Parts of this road to the tomb are still discernible after nearly thirty years. There is now a path, well worn by the feet of many pilgrims, which wends its zigzag way up the mountain side, making the climb as easy as possible. Here and there along the road are resting benches, donated by lovers of Stevenson's works, and usually bearing the names of the donors.

The tomb is majestic in its simplicity: an oblong of stone, concreted over its flat surface, with a superimposed terraced top-piece of stone on whose side is a bronze tablet carrying the epitaph of Stevenson's poem "Requiem," as he himself had chosen:

> "Under the wide and starry sky,
> Dig the grave and let me lie.
> Glad did I live and gladly die,
> And I laid me down with a will.
>
> This be the verse you grave for me:
> *Here he lies where he longed to be;*
> *Home is the sailor, home from sea,*
> *And the hunter home from the hill.*"

Various hands have attended during the passing years the tomb and its little plot of ground. At no time has it been neglected, not even when civil war waged beneath it and shells from great warships in the harbor tore the hillsides and one plowed its way through the Stevenson home below. Samoans, Germans, English, and New Zealanders have seen to it that no Stevenson lover could visit the place and charge that it was ill-kept.

The world loves Robert Louis Stevenson for his writings, the purity of his English, and for the figure he has made against its imagination. The Samoans love his memory, as they loved him in life, for himself; for his kindliness, his generosity, his deep interest in them and their little affairs. When the Samoans like any one they give him a name of their own; his other name doesn't count.

So, when Samoans talk of Stevenson they talk of "Tusitala," which means "writer of tales," the name they bestowed upon him.

Stevenson is credited with knowing and understanding the Samoan better than any white man who ever lived here. There are some expert German reports and books on Samoa, which delve to the depths of Samoan geneology, customs, language, and derivation of the race, but they are coldly scientific. Robert Louis Stevenson saw into the heart of the Samoan and read it as no one else ever could. That was one of the reasons why, in the few years of life allotted to him after he came here in an effort to conserve his health, he won such deep love and affection among the Samoan people.

There are many of the older Samoans who remember Stevenson as he was in life. There still are chiefs living who often talked with him. There are a few white men and half-castes left who knew him well. The Reid family lived near the Stevenson home and the author and elder Reid became fast friends. George Reid, now of Pago Pago, as a boy, played in the Stevenson home with Austin Strong, son of Stevenson's stepdaughter.

George Reid now is a member of the noted South Sea trading firm of Nelson, Reid and Company, with branches in Apia, Pago Pago, Auckland, New Zealand, and Sydney, Australia. Fred Nelson, his partner, who lives in Apia, where he was born, also knew Stevenson, though as a boy. Nelson is writing a book on life in the South Seas.

"Stevenson built the most beautiful home ever known up to that time in the South Seas, soon after he came to Apia to live," said George Reid, in recalling his impressions of him.

"He went into the wilderness four miles out of Apia to build it, choosing a site on the mountain side about five hundred yards off the road from Apia. An L-shaped trail was broken through from the main road to reach the place. It ran over level ground about 300 yards from the road, turned sharply and went on an incline upward the rest of the way. Where the trail led from the road was about 800 feet above sea level, so the house was about a thousand feet above the sea.

"The house was a large one, two stories high, with many large, spacious rooms, finely finished with walnut and other imported woods. There was a big reception hall with a floor of polished wood that was as smooth as glass. That floor was the most impressive thing in the house to me and I loved as a boy to go in and slide on it. Sometimes we would make so much noise running through the house that Mrs. Stevenson would tell us to be quiet and not bother Mr. Stevenson while he was writing.

"'Leave the boys alone,' he used to say. 'Their play doesn't bother me.'

"He used to do most of his writing in the early morning hours, starting at 2 or 3 o'clock. He rode horseback a good deal and had a fine black pony that I remember well. When he rode this into Apia the 'kids' all were glad to see him. He would go into a store and buy a big bag of candy and toss it to the little ones as he rode along on his pony.

"He went about among the people a lot and they liked him from the start. If any were in trouble he would do anything he could for them. When there was a great storm that ruined the crops on the island and food became short he would send away for a whole shipload of rice and other things and give it to the people. He brought to Samoa from Honolulu what we call the teuila plant, which bears clusters of yellow flowers something like lilies. The Samoans liked this flower and it now is grown widely in the islands. The Samoan people named Stevenson's stepdaughter, Mrs. Strong, after this flower, calling her 'Teuila.'

"He did so much for the people that the chiefs talked over what they could do for him, and after much thought decided that they would build a road for him from the main road up to his house, instead of the trail over which he rode his pony, and then make him a present of it.

"So they took axes and picks and shovels and started to cut their way through the jungle. They would not permit an ordinary Samoan to do any of the work, not even to clear away the brush and debris. Only the high chiefs, the talking chiefs and the chiefs were allowed to work. Of course, when they started clearing the forest along the trail, Stevenson could see them at work and knew what they were doing, but he did not say anything or pay any attention. Then when they had finished the road, 20 feet wide, 300 yards one way and 200 yards up the incline to the door of his home, they formally presented it to him.

"They named the road 'Ala Ole Loto Alofa,' 'The Road of Loving Hearts,' and had the best sign painter in Apia make a sign with the name on it which they placed where it left the main road to Apia.

"Stevenson used to give many dances and receptions at his home, and on his birthday every year there was a big reception to which the whole town of Apia was invited. His last birthday party occurred only a short time before his death.

"When my half brother, Robert Louis Reid, was born, Mr. Stevenson asked my father to name the child after him if it was a boy and my father said he would. Mr. Stevenson came over to our house when Robert Louis was having his first birthday and gave him as a present a silver cup. This cup had been a wedding present to Stevenson's parents when they were married in Scotland and was engraved with the names and dates My brother still has the cup in his home in Apia."

R. L. Stevenson's "old swimming pool," built by him.

George Reid, still a boy, was one of the mourners who attended the funeral of Stevenson and clambered up the steep hillside behind the men who were cutting a way through for the casket and burial party to pass.

Just as the resting place of the beloved author has been made more accessible and has been well kept up at all times, so has the home he built been preserved and dedicated to honorable uses. It has been enlarged, but along the lines of the original.

Herr Kuntz, millionaire German contractor, said to have made his money in Russian navy contracts, purchased the home from the Stevenson estate first. He lived in it part of the time each year, having another home in Honolulu, and had it kept in shape all the year round. It was while he owned it, that in 1899 a native war broke out.

Rebel troops gathered about the Stevenson grounds and quartered in the residence. American and British warships came into Apia harbor, far below. Native troops battling the rebels could only hold them at the line of the Stevenson grounds. Word was sent to them to fall back when they heard three whistles from one of the warships, as the rebels would be shelled five minutes after the whistle blew. The British ship *Porpoise*, Captain Sturdee (now Admiral) commanding, then shelled the place. The rebels decamped in a hurry and the war was soon over. After the World War the Germans were ousted peacefully and the British took it over. Administration of the islands of Western Samoa was given over to New Zealand by England and the Stevenson home became "Government House."

Lo! The Poor Indian Rivals Croesus

Tulsa, Where Oil, Operators, and Osages Are a Dominating Trio

By W. T. KRONBERG

"OIL, operators, and Osages" is more than alliteration; it is the gist of all life and talk around Tulsa and throughout the broad belt of Eastern Oklahoma. In the order named they are as complete as "the time, the place and the girl," "Stop, look and listen," or any other set of triplets—oil, operators, and Osages.

Oil built Tulsa; oil operators make their headquarters in Tulsa, and call it "the oil capital of the world"; the Osage race comes to Tulsa to spend its royalty allotments. A metropolis of 113,000 created from a village of 3,000, and that within a span of 20 years—that's Tulsa. It reminds a visitor of an overgrown country lad who decks himself in his Sunday clothes and steps out on a Thursday night. Not that it is of the yokel type. Far be it from that. Tulsa is a patron of arts. She has one of the finest and best equipped high schools in the country and a reputation in the theatrical profession of furnishing the coldest audiences in the United States, with the possible exception of Boston. This last should be convincing. Tulsa is not a city of dullards.

In Tulsa at present construction goes on apace—a million-dollar hotel building, two great churches, a Moslem temple, several commercial structures, a big hospital, and plans for a big Catholic academy have just been announced. Several skyscrapers and a magnificent Masonic temple have just been completed and a water system that brings the streams of the Ozark Mountains, 65 miles away, to the home taps of the city, was recently finished at a cost of $7,500,000. Tulsa is still growing, and while it grows Tulsaites talk oil, think oil, and dream oil.

It is recorded that petroleum was first discovered in 1846, in Pennsylvania, but a legend persists among tribesmen of the West that tends to convince one that the presence of oil was known to Indians probably before white men stepped foot upon this continent, though the red men did not know its nature or value. There is a legendary tale, which has so plausible a sound that oil men who have lost tanks of oil through lightning stamp the story as genuine. The legend is as follows:

Many moons ago, during a violent storm, the Great Spirit thrust a long, luminous arm out of the sky and touched with His finger a pool of water upon the plains. Immediately from the pool a flame flared up and illuminated the surrounding country. The natives gazed upon this phenomenon in awe and looked upon it as a sacred fire, offering sacrifices to it and conducting, within the circle of its glare, the fire dances of the tribes. Eventually, as the story goes, the Manitou of the winds became angry because of jealousy over the attentions paid to the "fire god" and descended with a furious roar upon the sacred pool, wiping out the flame and extinguishing the blaze forever.

It is deduced, as you have already surmised, that a pool of surface oil was ignited by lightning and that the blaze was extinguished when a "twister," more or less common to the central plains, passed over the spot and smothered the torch as easily as one might blow out the flame of a lighted candle. Thus, it seems, that while the squaw cut and carried wood and gathered the buffalo chips, and rubbed the fire sticks or struck the flint to produce the spark that furnished fire for warmth and cooking, under the earth where she sat, even upon its surface, lay inert the wherewithal, in the form of gas and oil, to furnish limitless fuel and fire.

This story is not written to fever the imagination of the speculating public. "A flyer in oil" is quite frequently a flight to disaster, and investments in new companies are, nine times in ten, financial catastrophes. Investigation in the field is all that is necessary to convince on this latter point. The map of Oklahoma is dotted with the sign of the cross, the emblem adopted by map makers to indicate the dry holes that have been drilled. An operator who should know told the writer that if all the money that had been *invested* in Oklahoma oil were placed in a pile alongside all the money that has been *made* in this oil, *the two heaps would be about equal.* True, the blue-sky laws of the state provide that drilling operations must proceed where stock is sold for that purpose, but in many instances holes are drilled at enormous cost to innocent and unsophisticated speculators when the promoters, who employ themselves with handsome salaries that come from the stock issues, have foreknowledge that the drilling will result in failure. However, stories are told in Tulsa of instances where promoters of this type have accidentally stumbled into oil pockets where dry holes were expected, and they were unceremoniously tossed into the legitimate oil business and remained in it as long as that particular well maintained a profitable flow.

Of course, the operators who are gathering the big percentage of oil from the bosom of old mother earth are legitimate business men who have no time for the so-called "bilking" operators. Few of these legitimate operators work as individuals. They form powerful syndicates with millions in reserve. To illustrate what an operator with limited means is up against in the Osage country: First, he must secure a lease of potential oil land, and to do this he must bid against big operators in an open auction conducted by the government. As the bonuses alone on these leases reached the staggering sum of $2,000,000 at the last auction, some idea of the problems that face the little fellow can be gleaned. If he is lucky enough to strike a pool in his drilling, it costs from $18,000 to $50,000 to complete his pumping equipment. However, in the event he strikes oil and erects his derrick, his troubles have only commenced. The very moment his gusher comes in the big mutuals become interested and they immediately sink offset wells to tap his supply. Then his production falls off and he must sink another well or two to get all the oil he can from the pool before it is exhausted or before the big companies empty the pocket. These efforts of our prospector now represent an enormous outlay in money and he is destined to secure only a small percentage of the oil from his lease, because the big operators by this time have four or five pumps erected on adjoining lands that are doing their best to drain the pool. Operations in the oil fields have become too intensive and extensive for the lone operator. It is strictly a millionaire's game today. As one oil man explained it:

A forest of oil derricks as seen at night.

"It is like an enormous no-limit poker game. The operator must stand ready with his chips to protect his hand, and only a few that sit in the game are financially able to stay with the cards until the show-down."

This fact is borne out by the record of failures that have strewn the oil fields with financial wreckage during the past few years.

The syndicates are financially able to work every wrinkle of the game to their advantage. They establish enormous tank farms, where, when overproduction forces down the price of crude, as is the case at this writing, they store the oil, and when production falls below stimulated demand they release this supply of low-priced crude at the prevailing increased prices. The oil business—the crude touch and go business of a few years ago—has developed into an intricate science, which only the wealth of a Croesus can command.

Through all of this exploitation runs the thin thread of ironical fate that has followed the red man since his first contact with the whites. All of the oil that comes from Oklahoma fields is taken from lands that were set apart in allotments to the Indians. Gradually it is coming back into the hands of the white men. It is an inexorably sure process, and soon the red man will have been absorbed in the great melting pot. The government has done its part to protect him—throwing safeguards around him, reserving his mineral rights, and so on, but the restless, improvident nature of the race hastens the inevitable. Happily, the government reserved the mineral rights for the Osage Indians until 1931. His fee he can dispose of if the deal is satisfactory to his guardian or guardians, but the mineral rights upon the land remain with him.

The present Indian population of Oklahoma is 119,225 and the annual income of these tribesmen is approximately $40,000,000. From these figures it is easy to see where the Osage tribe gets its reputation for affluence. We mention the Osage race particularly because these Siouxian aborigines are the most fortunate of all the tribes that received government allotments in Oklahoma.

The Osages, always hostile, were classed as savages when the allotments were made and received as their portion a great section of the wildest lands of the state. Within this reservation lay the Osage hills, undulatory land, worthless for the ordinary pursuits of agriculture, but ideal for stock raising and grazing. To the five civilized tribes went the more fertile and—at that period—more valuable plain sections. The Creeks, Cherokees, Chicksaws, Choctaws, and Seminoles that composed the latter settled down to the pursuits of agriculture, developing the land and establishing the cotton-raising industry to some extent. Not so with the Osage tribe. These Indians were restless and discontented, and frequent raids over the border into Kansas and other depredations caused no end of trouble prior to the discovery of oil on the reservation.

It may be well to explain here that on the allotments awarded to the members of the five tribes the mineral rights were reserved for each individual. This plan was not followed with the Osage. The mineral rights on their reservation were held in common, and this accounts for the universal prosperity of the tribe. Royalties from the entire reservation are distributed pro ratio to these Indians.

But when prosperity came to the Osage, common sense and reason fled from some of them. Few have retained their property rights. They had no taste for toil with thousands in white man's wampum pouring in upon them. Many are the tales told of the imprudent eccentricities of the gilded Indian, and to some observers his utter demoralization and ultimate extinction as a tribe and nation seem inevitable. The men of the tribe have, in most cases, become big-paunched and indolent. Many of them dispose of their land allotments, move into town, where they employ members of the white race to cook for them and to attend their household needs. They erect modern homes, lavishly furnish them, and then pitch tepees in the yards, where they dwell. In the latter case, the white lads of the towns turn a pretty penny acting as water carriers and chore boys for the red men. They ride in only the highest powered and costliest of cars, and drive them, quite frequently, while under the influence of badly distilled corn liquor, with disastrous results.

The eccentric antics of the royalty-rich Indians furnish endless amusement for the residents of Tulsa and other cities near the reservation in which is stored a bonanza in oil. A full dress suit, accompanied by white sombrero and cowhide boots, is the habiliment of the young buck, while the squaws come to town, on shopping expeditions, arrayed in satin slippers and silk stockings, with blankets, draped askew, over their shoulders. It is not an uncommon sight to see Indians, whose cars are parked at the curb, sitting on the sidewalks with their backs against modern office buildings, gazing interestedly, if not a bit contemptuously, at the passers-by.

Each member of the Osage tribe receives approximately $10,000 in oil royalties annually, but few there are who do not spend it as fast if not faster than it arrives. Under the wing of a government that has retained for them this title to the mineral wealth underlying the reservation land the Indians are prosperous. However, unless additional legislation is enacted, the mineral reservation clause terminates in 1931, and the rights will then revert to the holders of the land titles, many of whom are white men who have purchased the land from the Indians.

Thus the wheel of destiny turns, and it seems that the white man is fated to dispossess, a second time, the red man in America.

Should Inheritances Be Halved?

Concluded from page 2

ments, which for years have been sliding down the greased plank of extravagance and waste, are now up to the ears in the pool at the bottom of it.

Excessive taxation is necessary only to defray the costs of excessive waste.

When an incompetent manufacturer gets in a jam the only thing he can think of is to cut the wages of his employes.

When wasteful legislators get in a jam the only thing they can think of is to increase taxation.

The people who are being fleeced—and that means everybody—will have to take the initiative in stopping this waste, or continue to suffer from it in constantly increasing degree. The legislators who are piling on the taxes will never take the initiative; we may be sure of that.

Most persons have so little accumulated wealth that they expect to leave their heirs only their kind regards, and such persons may think that the question of whether inheritance tax laws are to remain unrepealed means nothing to them.

Every law that hurts the country hurts everybody in it; and it hurts the country to divert from industry and from undeveloped resources something like 60 per cent of each generation's accumulated wealth.

Moreover, if we think anybody in this country has wealth that does not belong to him we should not wait until he is dead to get it; nor should we take from anybody who is dead wealth that does not belong to us.

Mr. Ford's Page

THE question has been asked by a reader of this page whether a country-bred boy has a better chance than a city-bred boy to make a success of life. Sometimes that question is answered this way: a country boy has the better chance to make a success in the city, and the city boy has the better chance to make a success in the country.

In this matter we are still somewhat under the spell of the "log cabin" tradition. That is, so many of the notable men of fifty and seventy-five years ago were born in log cabins, that it was made a kind of trade-mark of greatness: if one would become famous, one should contrive to be born in a log cabin. In politics, especially, much has been made of the fact. In business or any other form of service the question was not so much where the man began as how far he had come. Multitudes were born in log cabins, but it made no more difference to them than being born in modern houses with furnaces and bathrooms makes to multitudes now.

The fact is that in a new expanding country the children of pioneers could not very well escape being born in log cabins; but it was evidence of the pioneer spirit of progress that the cabins were temporary and gave place to better dwellings.

When the log-cabin period passed it became customary to point to the fact that useful men came mostly from the farm, and the theory grew up that to be born on the farm was favorable to greatness. But it was the agricultural age, naturally the majority of the people were born on the farm, but the percentage of extraordinary men for the entire population was not overwhelmingly increased thereby.

An examination of the life history of the men who are now beginning to make their shoulders felt under the common burden would disclose that the majority of them were born in small towns, because the general period of their birth fell in what may be called the small town era. And so there is a theory much discussed today that being born in a small town is one of the predisposing conditions to success.

But it is natural to suppose that in the next twenty-five years so many of the men of conspicuous usefulness shall be found to have come from the city, that a new theory will appear which will state that being born in a city gives a boy the best chance of succeeding in life.

We no longer say with positiveness that the country gives a boy the best chance to grow, or that the city offers a handicap. The reason is that both city and country bred men now mingle together, and if they are of the same stock and moral training, they are not to be distinguished from each other in their equipment or power.

The general conditions of success are good health, mental alertness, a purpose and stamina. Theoretically the country ought to be the home of good health, but actually, as shown by the statistics gathered from armies, this is not necessarily so. City dwellers by reason of their very crowdedness and the artificial conditions which attend city life, have been compelled to find the most healthful way of living. Necessity thus drove the city ahead of the country in sanitation and a general knowledge of hygiene. In the Civil War, for example, it was found that the city clerks were abler to endure hardship than were the country-bred boys, and this was due to the difference in health; city food was more various and, at that time at least, city living conditions were much superior to those of the majority of farming districts.

But this has been equalized to a great extent during recent years. There has been a great movement of the people in two directions: there has been a movement of the city people to the country, and there has been a movement of the country people to the city; knowledge has thus been mixed among them all, and experience has been balanced. So that, in the matter of a good physical start, it is possible to say that both country and city now offer about the same opportunity. This will not remain true very long, however, if city congestion continues to increase and if the housing shortage and consequent crowding grow greater. But for the most part our people's tendency is to expand their borders rather than crowd closer together, as they do in Europe. Here there is room for expansion.

As to mental alertness, there is something to be said both for and against the country as well as the city. From one point of view the country offers—perhaps it would be proper to say that it once offered—the opportunity for the young mind to grow naturally, to find its powers without unnatural stimulus. That, at least, is the way it is stated. This view, however, may be part of the old log-cabin theory that as hardship made for fortitude, so the country silences made for strong mental fiber. If the country silences always did that, the question would be decided. But for one in whom this silence has wrought strength, there have been multitudes in whom it only wrought numbness and dullness. The point can only be proved in individual cases, not in masses.

And it is yet to be shown that city life overstimulates the youthful mind in its formative years, renders it superficial and makes it dependent on excitement. City life is not really so exciting and superficial as it appears from a distance. There is about as much routine in the city's daily round as there is on the farm, but the friction of minds is greater and the presence of ideas is more apparent. The rubbing of mind against mind makes for alertness. The mill of the mind has more grist to grind upon. This, of course, is possible in the country too if the mind seeks the grist.

The training of character which is indispensable to any form of successful usefulness is possible in one place equally with the other.

But it remains true that the city draws the active mind. It has done so almost exclusively until recently. That is why the affairs of the city—its business, invention, science, government, distribution of reward—have gone forward more progressively than the affairs of the country. But we live in a time when men are seeing that the country offers a great field for improvement and development, and the result is that the affairs of the farming communities are no longer so neglected as they were. Men have gone into the city, have caught a glimpse of what a mind at work can accomplish, and they have returned to the country to work, just as formerly they went to the city.

There is, however, a new vision among country-bred boys of the field for their greatest ability which the problems of American agriculture offer. They are no longer restricted to city opportunities for big things to do. The next biggest thing to come in this country is the New Agriculture, the inauguration of which will give scope for all the power of business statesmanship that the country can produce.

If success means the alertness to see what needs to be done and the power to do it, the field for the attainment of success increases faster than do able men to plow it. The problems of the farm are big enough for the biggest mind we can produce—apparently much too big for the minds that have thus far tackled them. Success is *doing*. The era of *talking* is over. And certainly there were never so many things waiting to be done, in country and city, new things, massive things, beneficial and all-round socially profitable things, as there are today.

WHATEVER advantage the country once possessed over the city as a training ground for success has now been equalized. The elements of success are health, a purpose, alertness and stamina; these are possible both in country and city. The city and the farm alike provide problems bigger than the biggest minds now functioning; wherever a young man may choose to cast his lot he will find work big enough to develop all the moral and mental muscle he can produce. Being born poor may be a handicap or a stimulant, depending on the person. In these days, however, few if any are born poor. In these days everyone is born into the midst of more opportunity than met the greatest genius of a hundred years ago. We are entering an era when the failure is more prominent than the success, because more unusual.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Last Point

THE question of the establishment of a separate Department of Air Defense may be regarded as settled. But it is no longer possible for anyone to contend that air defense itself has been adequately served by the departments charged with that responsibility. The Secretary of War and the Secretary of the Navy have, neither of them, anything to be proud of on the showing of the facts. They are right in their contention that Navy Air Service belongs in the Navy and Army Air Service belongs in the Army, but their position would have been much stronger had they been able to show that air service was receiving the attention due its importance in either of these branches. That much is clear from the rumpus stirred up by Brigadier General Mitchell.

There are three points thus far: the advisability of a separate department of air defense; the contention of neglect of air defense by the Army and Navy; the difference of opinion as to the importance of aircraft as an attacking arm at sea. The first two are now pretty well decided. The last remains to be. There is so much contradiction and confusion in the statements made that it seems feasible, a condemned warship being available, that a test be made under conditions that will leave no room for differences as to the facts, at least. There will always be differences in judgment, but in such matters as these the actual facts should be easily established and agreed upon. But such a test would only determine what airplanes can do now, not what they may do under further development.

It is one thing to say what the limitations of airships may be as an attacking arm in their present experimental stage; but it is quite another thing to say that these limitations, whatever they may be, cannot be removed by further development. What the airmen ask for is a chance to develop.

We believe that one safe result of the investigation is that they will be given that chance. In spite of the mistaken tactics and personalities disclosed by the investigation, it has at least opened the eyes of Congress to the wisdom of giving these young airmen a fair opportunity to perfect their art.

How Will They Learn to Work?

THE DEARBORN INDEPENDENT is opposed to everything that savors of exploitation of child labor. It has no associations with any interest that uses child labor or wishes to use it. Any system which renders it necessary for mere children to work is a wrong system on that showing alone; no other defect is needed to condemn it. But to hold, on the other hand, that teaching a child to work is cruelty, and preventing him by law from working until he is 18 is a national duty, is to go to the opposite extreme.

There are three matters involved here: first, the exploitation of the labor of children. Second, the method of doing that. Third, the means of teaching children industrious habits.

Public opinion has won control in the first matter. Children are now exploited, if at all, in violation of the law. If there are still places where this occurs, it can be stopped. Every State is equipped with sufficient enlightened public opinion, functioning through various bodies, to correct any local situation that may exist. What a State will not do, the Federal law will have a hard time making it do, as local opinion is the strength of all laws.

As to the second matter, public opinion is divided, with a strong leaning against amending the Constitution of the United States in the manner proposed. There are people who take the sound ground that the Constitution should not be amended to abridge liberty, but only to enlarge it; that the Constitution should not be made the instrument of local government. There are other people who, examining the proposed Amendment, say, "Why, this is not a Child Labor Amendment at all, it is a *Child Control* amendment. It does not regulate the conditions of work, it takes the child himself and puts him into Congressional custody. We are against exploitation of children's labor, but we certainly are not in favor of nationalizing or federalizing our children." It is evident now, however, that much as the conscience of the nation opposes child labor, the *mind* of the nation has been alert to see that this amendment does not propose to control child labor, it proposes to control children. On that ground the amendment will not pass; the people are not going to hand over their children, neither to Congress nor to a bureau comprised of political women.

There remains the third point: the problem of today is not the young worker but the young loafer. Young America loafs. Young America resents being shown how to work. Young America sees life as a white collar and all dressed up. The men who made this country were imbued with a sense of the achieving power of work. As boys their big thought was what they were going to work at when they grew up. They found their pleasure in making things, or doing constructive things. And the value of that kind of boyhood is now apparent in their manhood. With an amendment to the Constitution compelling young men and women to loaf until they are 18 (it was even talked of making it 21), with loafing legalized and compulsory, what will supply the acquaintance with Work which is inevitable in life?

That is the biggest question. Child labor has disappeared. The menace of the nationalization of our children is fast disappearing before the common sense of American legislatures. But the third question remains: by what means shall the rising generation become acquainted with work—work as the creative outlet and the lever of power?

Fallibility of Expert Opinion

FIRST of the year's bank bulletins from eastern experts are at hand, and the general tone of optimism which marked the closing months of 1924 is continued. That there exist differences between them is only an indication of the fallibility of even the most expert opinion in the realm of finance.

One of the most highly esteemed of these bank publications is that issued by the National City Bank of New York. Its editor, Mr. Roberts, relies to a great extent on the iron and steel industry as providing a barometer of general business. Other metropolitan financial writers also depend upon this basic industry, and the independent financial writers generally give it a leading place in their analysis of the business situation. The reason is, of course, that iron and steel enters into so many lines of business that its activity indicates in large measure the activity of the whole.

Bank bulletins, however, are generally a month behind other publications, in that their predictions are based on past business. At times, too, they make slips which cause uneasiness in the reader, especially if he sees in the financial situation something more profoundly important than money-making.

In opening his view of the year's prospects, Mr. Roberts is confident that every bright promise for the new year will be fulfilled, and calls attention to the fact that business in the iron and steel industry for November and December exceeded that of any consecutive two-month period since December-January, 1919-1920. With the memory of the disastrous period which followed, the comparison may not be altogether happy.

A copy of *Finance and Industry,* arriving in the same mail, disclosed that the iron and steel plants of the Cleveland Federal Reserve District are to reduce their production. That publication is the organ of the banks and big industries, and is telling what is going on. None of the plants affected has exceeded 90 per cent capacity since the return of prosperity, and restriction at this time can only indicate that caution is necessary.

Fallible as financial writers are, it would be much worse than fallacious to construe this difference between prophecy and fact into a cause for alarm. Quite the contrary: moderation is an element of safety. It may be much better for all if supply can always follow demand and never quite overtake it. Months ago, when a presidential election gave a start to speculation which many mistook for a business boom, THE DEARBORN INDEPENDENT, though confident of industrial recovery and expressing that confidence most unequivocally, advised its readers not to confuse speculative fever with business activity. Fevers are ephemeral—they change: the normal processes of life are stable, they endure.

Congress Increases Its Salaries

NO DOUBT members of the House of Representatives and United States Senators who lack private fortunes and whose normal incomes cease while they are in Washington found their salaries pretty low for comfortable living at the capital. No doubt it is not a good thing for the country to have its national legislature always on the ragged edge of penury. No doubt it is a wise provision to assure men of ability and character that at least they can live in a respectable manner if they accept public office and serve at Washington.

No doubt at all of this.

No doubt Congress has a right to raise its salaries if it sees fit. No doubt it can choose to raise them in a manner that belittles that august body in the eyes of the whole nation. No doubt it has authority to shuffle quietly into higher salaries if it wants to.

No doubt that it can; no doubt that it has.

But, with the postal employes refused their little $25 a month increase; with the President chopping off Inauguration expenses; with a $10 reward posted up in the White House offices for suggestions how to save money in the work of that office; with the whole keynote of the Administration being Economy—with all this as part of the scenery, no doubt Congress has chosen to play an awkward part.

The humiliating thing about it is that Congress did this as it does no other business, without record. The straightforward thing to have done was to make a plain statement of the necessities of the case, if such a statement may be truthfully made, and then take a roll-call vote, man for man, in House and Senate, instead of voting as a mob, concealing both the Ayes and Noes, and acting generally like men perpetrating a questionable act.

The vote was taken after this manner because Congress knew that the salary raise would be criticised at home. They wanted the money but they did not want to stand responsible for the vote. The humiliation is not Congress'—not by a great deal; the humiliation is the people's as they contemplate this lack of straightforwardness on the part of their representatives. They take the money but they won't give their names. Maybe they are entitled to the money; if so they should have given their names. But the method was so unnecessarily cheap.

This Is How It Goes

IN 1918 the per capita debt of the city of Detroit was $26.53. In 1923 the per capita debt was $150.62.

The per capita average tax payment for 1918 was $33.49. The per capita tax payment in 1923 was $106.46.

The increase in the amount of property taxes collected rose between 1918 and 1923 to more than 155 per cent.

This is the way our cities are going, but that is not the worst. If these increased tax payments represented the efforts of municipal governments to keep our cities out of debt, it would not be so bad. But in addition to all this, the municipal indebtedness mounts by millions, and mounts so high that in the city of Detroit the interest payments alone amount to $8,705,203 a year. So that increased taxation represents but a part of the increased cost of municipal administration. If the real cost were placed on the taxes, cities would simply cease to be as financially responsible units.

In any other line of business, extension of service and increase of patronage means lower cost and larger profits. Why not in a city also? A city has service to sell—water, paving, lighting, schools, police and fire and health protection, and various other public benefits. With half the number of people, the city of Detroit supplied these services for one-sixth the present cost. That is, with twice the number of customers, Detroit must charge six times as much for the service. Suppose that were the history of the motor industry in Detroit! Suppose that when 500,000 cars were made a year they could be had at $500 each, but when the business rose to 1,000,000 cars a year the cost per car rose to $3,000! In business, the increase in patronage, which makes possible an increase in production, results in a decrease of cost. Why does it operate the opposite way in municipal business?

The larger our cities the more cheaply and efficiently they should be administered. The exact opposite, however, is the case. Our big cities are administered in a manner that no business on earth could endure, and only the tax authority given local governments has hidden the disastrous deficits. But even this is beginning to break. The weight of the tax is killing the public goose that lays the tax. And the end of the mess is a contemplation that may well give rise to serious foreboding.

The Romance of Dorothy Osborne

She Had a Mind of Her Own and Might Have Married Cromwell's Son

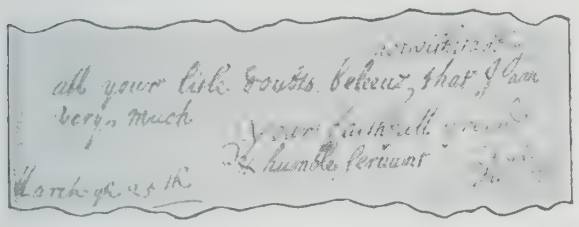
By FRANCES HOLBROOK PFEIFFER

NEARLY three hundred years ago—in 1653, to be exact—Dorothy Osborne wrote to her lover, Sir William Temple:

"I do not see that it puts any value upon men when women marry them for love (as they term it); 'Tis not their merit but our folly that is always presumed to cause it; and would it be any advantage to you to have your wife thought an indiscreet person?"

Dorothy Osborne, a remarkably spirited young woman, lived during that exceptional period in England, the seventeenth century—a period which produced John Milton, John Evelyn, the diarist and author of "Sylva"; Pepys, Izaac Walton, Jeremy Taylor, of whose sermons Dorothy was a devout reader; Addison, Steele, Dean Swift, Pope, Waller the poet and Crowley; as well as Lady Mary Montagu, the Duchess of Sunderland and Oliver Cromwell whose son, Harry, was one of Dorothy's many suitors or "servants":

"And I shall not blush to tell you that you have made the whole world besides so indifferent to me that, if I cannot be yours they may dispose me as they please. Harry Cromwell will be as acceptable to me as anyone."



Later, with a young girl's excusable retrospection, she reminds Temple of how great she might have been if she "had been wise enough to have taken hold of the offer of H. C."

Dorothy could well write feelingly upon the subject of marrying for love alone, because she had, of necessity, given it much thought while she waited for William Temple. It was not the want of reciprocal love that caused the delay but want of money. So, their "crossness of fortune" has given us these inimitable letters.

These seventeenth-century young people met when they were in their early twenties, about 1648, at an inn on the Isle of Wight. Dorothy, accompanied by her brother, and Temple, a care-free young man of fashion, were all on their way to France. Dorothy's father, Sir Peter Osborne, was an ardent loyalist and had been Lieutenant Governor of Guernsey, and had held that last stronghold of King Charles against Cromwell, under great hardship. Naturally, Sir Peter's son was as fiery in his loyalty as his father; while they were waiting at the inn he amused himself, one day, by writing his private opinion of Cromwell on a window pane. As a result the whole party was arrested and brought before the governor. Matters might have proved very serious had not Dorothy, fearless and quick-witted, taken all the blame; and because she was beautiful and vivacious—seventeenth century men, even governors, were not so immune to feminine charms—they were released, all but Temple!—he had lost his heart, and later became Dorothy's suitor or "servant," and served his seven years, as did Jacob of old.

SIR WILLIAM TEMPLE.
By Sir Peter Lely.

Temple's father, Sir John, had a more advantageous alliance planned for his son than the daughter of a nobleman whose fortune had been depleted in the service of his king, and Dorothy held out against all the pleadings and arguments of her lover to marry him until a suitable settlement could be made. She was far from mercenary, but proud, well-bred and—wise:

"I shall not be ashamed to own that I have particular value for you above all others, but 'tis not the greatest merit of a person will excuse a want of fortune; . . . . 'Tis much easier, sure, to get a good fortune than a good husband; but whoever marries without any consideration of fortune . . . . the whole world shall pronounce they did it to satisfy their giddy humours."

Dorothy's father, after the fall of the king, retired to his estate, Chicksands Priory, Bedfordshire. This religious institution had been founded in 1150, dissolved by Henry VIII, and soon after passed into the possession of the Osborne family. It was a somewhat gloomy house, of ecclesiastical architecture, but stately withal, set in a garden that Dorothy loved; not a lively place, but Dorothy seems not to have been lonely. She was not without resources. This picture she gives Temple of a day of her life at Chicksands—the day of a girl in 1653—has come down to us, a quaint and lovely print:

"You ask how I pass my time here; . . . . I rise in the morning reasonably early, and before I am ready go round the house until I am weary of that, then into the garden until it grows too hot for me. About ten I think about making me ready, and when that's done I go into my father's chamber, from whence to dinner, where my cousin Molle and I sit in great state in a room and at a table that would hold a great many more. After dinner we sit and talk until Mr. B. comes in question, and then I am gone. The heat of the day is spent in reading or working, and about six or seven I walk out into the common that lies hard by the house, and where a great many young wenches keep sheep and cows and sit in the shade singing of ballads. I go to them and compare their voices and beauties to some ancient shepherdesses that I have read of, and find a vast difference there; . . . . I talk to them and find they want nothing to make them the happiest people in the world, but the knowledge they are so! Most commonly when we are in the midst of our discourse, one looks about and spies her cows getting into the corn, then away they all run as if they had wings at their heels. I, that am not so nimble, stay behind; when I see them driving home their cattle 'tis time for me to go too. When I have supped I go into the garden, and so to the side of a small river that runs by it, when I sit down and wish that you were with me . . . ."

—Just a young girl seeking out the companionship of other girls—a young girl in love in that long ago.

Chicksands Priory has been restored and made over so that only a few ancient portions of the house remain. It is interesting to find the portrait of Cromwell in the library of a house that had been the loyal Osborne's! In the principal gallery are Sir Peter Lely's portraits of Dorothy and Temple (herein reproduced). As we look upon that purposeful, proud face, it is pleasing to read what she writes to Temple, in London, about this very portrait:

"I have been thinking about sending you my picture until I could come myself; but a picture is but dull company, and that you need not; besides, I cannot tell whether it is very like me or not, though it is the best I ever had drawn of me, and Mr. Lilly (Lely) will have it that he never took more pains to make a good one in his life, and that was it, I think, that spoiled it. He was condemned for making the first he drew of me a little worse than I, and in making this better he has made it as unlike as 'tother."

Later:

"I have sent you my picture because you desired it; but pray let it not presume to disturb my Lady Sunderland's. Put it in some corner where no eye can find it but yours, to whom it is only intended . . . . It must hang with the light on the left side of it; You may keep it until I bring you the original. But then I must borrow it because my brother is often bringing people into my closet where it hangs, to show them other pictures that are there; and if he misses this long thence, 'twould trouble his jealous head."

DOROTHY OSBORNE.
By Sir Peter Lely.

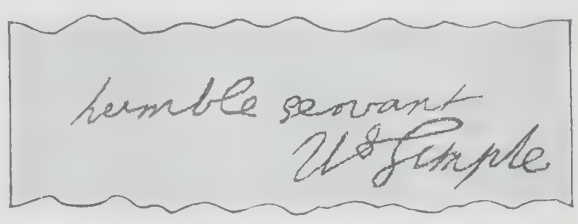
This brother of Dorothy's bitterly opposed her betrothal to Temple, partly because of that gentleman's lack of fortune and also because he doubted Temple's love for his sister; and largely because young Osborne was not fond, personally, of his sister's lover and wished her to accept one of her many advantageous proposals; but mostly, we are inclined to suspect, because here was a woman in the seventeenth century who would not be governed by her "men-folks," who had a mind as well as a heart of her own! Picture an old English drawing room, stately, and somber in the light of candles and dying fire, and two people, richly dressed and quaint, engaged in a dignified quarrel—Dorothy and her brother:

"I drove him so close 'tother night that for want of a better gap to get out at, he was fain to say that he feared as much your having a fortune as your having none, for he saw that you held my Lord Lt.'s (Cromwell) principles. That religion and honor were things that you did not consider at all, ... and that you would take any engagement to advance yourself. I had no patience with this. To say that you were a beggar, your father not worth £4000. in the whole world, was nothing to having no religion, no honor. I forgot all my disguise and we talked ourselves weary; he renounced me and I defied him, but both in as civil a language as would permit, and parted in great anger with the usual ceremony of a leg and a courtesy, that you would have died laughing to have seen us."

The next day Dorothy did not appear at dinner, and also supped in her chamber. Later, around the fireside, she and her brother and Mr. Gibson talked of indifferent things until Mr. Gibson left them alone. After a half-hour of oppressive silence the brother said, in a "pitiful tone," that he had not slept and dreaded the coming night. Dorothy pretends not to understand to what he refers, and finally they talk of melancholy and its causes:

". . . . and from that (I know not how) into religion. We talked so long of it and so devoutedly that it laid all our anger. We grew calm and at peace with all the world. . . . . He asked my pardon and I his, and he promised never to speak of it to me while he lived."

While love may have remained unchanged in all ages, in Dorothy's day, a lady was wont to express herself with a certain restraint, in love as well as in other



things. One cannot doubt, who reads all her letters, that she loved as deeply as the true in our own day, although her letters begin "Sir:" and usually end with the ceremonious "Your faithful friend and Servant"; once "Adieu, my dearest," and the most demonstrative, "Your servant kisses your hand, and I am,

Your faithful."

Although her letters are written with seventeenth-century dignity they breathe a tender devotion, and, like a modern girl in love, she tells him all the happenings in her quiet life and even jests about her suitors:

"Well, give me no more occasion to complain of you or you may not know what will follow. Here was Mr. Freeman yesterday that made me quite a kind visit, and said so many kind things to me, that I was confounded with all his civilities and had nothing to say for myself. . . . Methinks me see you laugh . . . Mr. Freeman, you believe, is designed for somebody who deserves him better. I think so too . . . . and you have reason to believe that I can never be other than,

Your faithful friend."

Dorothy had an elderly importunate "servant" whom she jokingly wrote of as the Emperor Justinian—a widower with four grown daughters:

(*Concluded on page 14*)

Moor Park, Hertfordshire, England, as it looked when Dorothy and Temple spent their honeymoon there in 1655.

Uncle Sam's Big Rent in Washington

A Government Which Does Not Own Its Departmental Buildings

By STEPHEN POOLE

DO YOU own your own home, or, do you pay rent? Your Uncle Samuel lives partly in his own home and partly in rented property. In fact, he is one of the biggest rent-paying tenants who writes out checks payable to Capitol landlords. Should you visit Washington do not be misled into thinking that every government department you enter is housed in a government-owned building. For instance, there is that large office building on Vermont avenue that houses the Department of Justice; it is a rented building. Uncle Sam pays an annual rental of $75,000 for this building alone.

The most of the bureaus and departments are renters to some extent. To be sure, most of the more imposing departmental buildings are owned by the government, yet at the same time the business of Uncle Sam has grown so enormously that all of his fine buildings do not suffice to house his activities.

(C) Harris & Ewing.

This group of buildings constitutes what is known as the Government Hotels. Their construction is typical of the temporary buildings referred to in the article.

For instance, in addition to buildings owned by the government, the Department of Agriculture is paying an annual rental of approximately $200,000; the Civil Service Commission, $16,875; Commerce Department, $68,000; the Interstate Commerce Commission, more than $72,000; the Labor Department, $24,000; the Treasury Department, more than $70,000, and the War Department more than $82,000, and so on. Uncle Sam has an annual rental bill of approximately three-quarters of a million dollars.

This may surprise you, for you have doubtless thought that the government owned sufficient buildings in Washington to house all of its employes engaged in the Capitol city. But this is not the worst of it. A great deal of the office space used by Federal employes and owned by Uncle Sam is not only unfit for use, but is positively dangerous to the occupants. These buildings are the temporary structures erected during war time to meet the exigencies of war.

Senator Smoot, in speaking of them, recently said on the floor of the Senate:

"Mr. President, a serious factor in the situation is that a large part of the government's office space in Washington is located in the temporary war-time buildings. As is well known, these buildings are of the most inflammable wooden construction and are a serious menace to the safety of thousands of employes, records, and files of the government. They are rapidly deteriorating, and it is only by the expenditure of considerable money yearly that they are habitable at all. It is difficult to keep them warm in cold weather, and on extremely hot days in the summer the temperature on the upper floors is almost unbearable. On such days as these it is no uncommon occurrence for numbers of employes to be overcome by the heat. There are instances where chiefs of bureaus or divisions have found it necessary to dismiss their employes for the day, rather than subject them to the punishment of working under such intolerable conditions. The government is under a distinct obligation to furnish its employes comfortable and safe working quarters. No well-conducted business house would subject its employes to such conditions nor imperil its records and files by housing them in such inflammable buildings."

There is hardly a department of the government that is adequately and properly housed. The activities of some of the departments are so scattered that there is necessarily much duplication of work, and many added labors. As a result, there are many additional employes that could be eliminated if the activities of each department were conveniently housed under one roof, as nearly as practicable.

Note this, the activities of the Department of Agriculture are housed in forty-six different buildings; the Commerce Department in seven different buildings; the General Accounting Office in twenty-one different buildings; the Department of the Interior in eight; the Department of Justice in six; the Department of Labor in four; the Navy Department in eight; the Treasury Department in thirty-six and the War Department in fourteen.

When you stop to think that a great many valuable records of your government are stored in these inflammable buildings, you can begin to appreciate the extremely dangerous possibility of their destruction by fire.

It has been only in recent months that, during repair work on the roof of the Treasury Building (supposedly a fireproof building), fire broke out on two separate occasions and it was reported that some of the records were destroyed. If this happened to a fireproof building it is easy to imagine what would happen should these wooden fire traps catch fire.

These and various other considerations have at last impressed leaders in Congress with the necessity of providing adequate housing facilities in the District of Columbia for government use. A bill is now pending which proposes the expenditure, during the next ten years, of $50,000,000 for government buildings within the District of Columbia.

Fifty million dollars for public buildings doubtless impresses you, notwithstanding the fact that we have become accustomed to an annual governmental expenditure in excess of three billion dollars. Perhaps, you may feel that it is wise to continue paying rent. But is it?

What about the matter of economy? Senator Smoot says:

"The government is now paying rentals in the District of Columbia amounting to $733,469.11 annually. In addition to this, there are the maintenance and upkeep charges on these rented buildings, which the government pays and which in many cases is as much as the rent. It is therefore safe to say that the construction of public buildings and the elimination of these charges would easily effect a saving of $1,000,000 annually. Other great economies would result when each department is able to bring its activities together under one roof or at least in the immediate vicinity of each other.

"As the situation exists today, the government is squandering untold sums of money for messenger service, automobiles, trucks, time lost by employes going from one building to the other, delays while officials are waiting for papers, and so forth, which in numerous instances must be secured from another division or bureau located at a considerable distance. The time wasted by the public in transacting business with the government on account of the widely scattered units of each establishment is also large.

"It is difficult accurately to estimate the great savings which would result by bringing together the bureaus and divisions of each department. The Controller General, for instance, has estimated that a saving of $250,000 per annum could be effected in administration by having the General Accounting Office in one building, and the Commissioner of Internal Revenue believes a building for that bureau would save at least 15 per cent or 20 per cent in the cost of collecting taxes, besides securing more nearly 100 per cent of the sums due. These are only two instances, but savings of greater and lesser degree could be similarly effected in practically every governmental establishment."

Photos (C) Harris & Ewing.

Above—Interior Department. At right—Department of Justice, a building the Government rents at $75,000 per annum.

Senator Smoot says that the government is violating fire, sanitary and health rules which it would require private owners of buildings to observe and says that he knows of "no private concern nor of no private individual that would take the chances which the Government of the United States is taking today in these temporary buildings, both as to the risk of the lives of its employes and the destruction of records of untold value that all the money in the world could not replace."

In the various departments and independent establishments there are literally thousands of dead and semi-active files that occupy a great deal of valuable office space. The bill pending before Congress proposes, out of this $50,000,000 fund, to build an archives building, especially constructed for the proper storage and filing of these records, so that they will be available and at the same time properly protected for all time to come.

This bill has already received some discussion at the hands of the Senate, and it seems to have but little, if any, opposition. It has, however, been temporarily halted in its passage in the Senate; not because any of its provisions have been cited as objectionable, but rather, however, that Senator Smoot would not accept an amendment offered by Senator Fletcher appropriating approximately $40,000,000 more to take care of a condition that has existed since the passage of the public buildings bill signed by President Taft on March 4, 1913. "Under that bill a number of sites for post offices were acquired throughout the country. Many sites were donated to the government; others were purchased at very reasonable prices, and under that bill the construction of buildings in various portions of the country, in practically all of the states, was authorized. But it was found when the government went to let the contracts that the prices of materials had so risen and the cost of labor had so increased that the government could not construct the buildings authorized within the amounts of the appropriations, and in a number of instances the sites have remained vacant because no appropriation was made for building at all. In a number of instances they have been vacant because the appropriation was inadequate to construct the buildings. That situation has continued for 11 years, and Congress has failed to provide these buildings."

Senator Fletcher contends that this is a situation that demands attention as well as buildings within the District of Columbia. He cites the fact that the Post Office Department has an annual rental bill of $11,660,056, and that there would be a great saving to the government to own its own buildings in a great many of the larger towns and cities where buildings are now leased.

Mr. Coolidge on Economy

By BURT M. M'CONNELL

MR. COOLIDGE has the happy faculty of revitalizing and even dramatizing the commonplace virtues. Thrift and economy used to be copybook maxims; Mr. Coolidge has rediscovered their meaning and put them to work for the government. In a recent talk to some two thousand Federal employes, he recommended the elimination of useless government bureaus, the separation from the government service of superfluous employes, and consideration of the taxpayers' interests!

Mr. Coolidge's talk was such as a captain of industry might give to a business organization. It was an example in retrenchment which might be followed with profit by states and municipalities. Administrative economy offers the only means of digging out from under the enormous taxes which are now precipitated on us.

It required a great deal of backbone to say that the government's annual pay roll of $1,680,000,000 must be reduced. For terrific pressure is brought to bear upon a man in the President's position by Senators and Congressmen. Then there are the department heads—his right-hand men—who constantly ask for increased allowances. The various blocs are ever on the alert for appropriations. Others want new Federal bureaus, and still others plead for the expansion of old ones. The demand for extravagance is organized and insistent, while the demand for economy is unorganized and sporadic.

The efforts of Mr. Coolidge in behalf of economy and thrift in government expenditures spring from the sincere belief that we cannot have a thrifty people unless we have a thrifty government.

Cutting down the list of government employes will require the liberal use of the presidential axe upon some of the "dead wood" of political patronage. Thousands of government workers throughout the country are no doubt wondering just where the axe will fall. That Mr. Coolidge will keep his promise to reduce the pay roll no one seems to doubt. He realizes that while in 1915, a normal pre-war year, the cost of government was but $777,840,282; in 1924 the entire cost, including $471,800,000 required by law to be applied to the reduction of our national debt, was $4,147,677,965, a net increase, not including payments on the war debt, of almost three billion.

Animals Take to Human Inventions

A Closer Affinity Arising Between Man and the Wild Creatures

By ROBERT SPARKS WALKER

Birds are learning to trust humanity. I know of nothing that gives brighter hopes for world peace than this. See how they are coming to the cities, and how confidingly they are nestling up to man! The robins are building their nests in cities directly over paths and sidewalks, to get the advantage of human protection.

LESSER animals soon become accustomed to new devices employed by mankind, and some of them seem to take to them as naturally as if each were a natural creation and designed for their especial benefit. One would think that a roaring, puffing, flying, rocking passenger train would be sufficient to drive every wild creature within its path to seek safety at a great distance, yet the familiarity of even the unworthy mosquito has given commercial advantage to newsboys in certain parts of the South, who have seized the opportunity of spraying railway passengers at ten cents a head, as a preventive of bites from the mosquito!

On Decoration Day, 1923, while returning from a ten-mile trip in the country as a front seat passenger in an automobile, I observed a number of house flies loitering about the hood of the engine. It had been a sultry day and the atmosphere was humid. When our auto started, all except five of the house flies flew away. The five that decided to remain with us perched themselves upon the hood. I knew how fast my niece, who was to pilot the car, was going to drive, at least a part of the way, for there was a dark cloud rising in the west, and we were plunging directly toward it. I thought surely the friction of the swift breeze would cause them to give up their grand stand seats, but while traveling at a lively clip the flies seemed to enjoy being hurled through the air. Apparently, at times, they were interested in objects that were passed on the roadside. The speed was accelerated to 25 miles an hour to test the flies' pluck, but they paid no heed to the pressure of the air, and one fly raised his forefeet as if he were really enjoying the ride. I do not know but that he was waving a hand at John Bluebottle, or some other friend whom he had recognized along the way. Apparently, the flies experienced no difficulty in remaining on the car, and at least two of them walked leisurely over the surface testing various accumulations on the hood with their tongues to ascertain if they were fit for food. After we had traveled three miles, all of the flies were still with us and enjoying the ride. Three miles farther on, the flies moved about, and one daring fellow walked over to the edge of the hood where friction seemed to be greatest. When we ran headlong into a heavy downpour of rain, the five flies left us as calmly as they had been able to ride on the swiftly moving engine.

One June evening, I left Chattanooga near midnight for Memphis. Thirty minutes after the train had started on its journey, a beautiful katydid lit on the pane of my window. I think the train was moving at from forty to fifty miles an hour. At any rate, the bright light that shone through the window, and the speed of the car occasioned it no inconvenience, for it remained on its glassy seat with ease for thirty minutes or longer, during which time it utilized the saliva and with its forefeet took a midnight ablution. Surely a bath taken on a swiftly moving train and in a bright light was something unusual for this katydid and its ancestors, but to the observer it went about its business in a manner that made it appear it had long been practicing it.

Two years ago, a friend shipped me two crates of peaches by freight from a point fifty miles away. The fruit had set over on the ground in the peach orchard the night before it was shipped. At my railroad station it was kept overnight and delivered to me in the morning. When the lid was removed from the first crate, in the top center of one of the cups was coiled a king snake that measured more than two feet long. The snake had evidently chosen its fragrant seat sometime during the night while the crate of peaches was on the ground before it left the orchard. There was nothing to hinder it from crawling out at any time, and the opening was large enough to admit daylight, yet on the jolty and noisy trip it chose to remain in the peach crate until driven out by the consumer.

Nature does not keep her creatures in a rut. Man often gets himself into a rut, but it is because he has in some manner thwarted nature in her course. Nature decrees a certain work for every creature. If its brief life brings it face to face with the artificial creations, or into the presence of the products of man's ingenuity, it adapts itself to the new condition and moves on. See how soon dogs learn to ride in the automobiles!

I have often observed a raccoon turned loose in my kitchen. He soon hastens to the sink. In the wild state the raccoon is foolishly fond of water. He is never so happy and so full of fun as when given his freedom in a kitchen sink with both faucets open. He reaches up for the soap, gets two small bars, one for each forepaw, and he amuses himself for hours by floating the soap in the water and fishing for it with his nimble paws. It is easy to imagine that the noise of the flowing water sounds much like water trickling over a stone in the mountain stream. He frequently turns his head to one side, and, like a boy with an open mouth, delights in letting the stream pour through it! When the water is turned off, he stands up and makes a futile attempt to turn the water on again, for he was not long learning the secret of its source.

Birds are learning to trust humanity. I know of nothing that gives brighter hopes for world peace than this. See how they are coming to the cities, and how confidingly they are nestling up to man! The robins are building their nests in cities directly over paths and sidewalks, to get the advantage of human protection.

Birds that kill their prey seem to know instinctively that the average human being will not stand quietly by and see it take the life of another creature. A few weeks ago, in a residential part of a city, I was walking along the street when I observed a sparrow hawk approaching, and when it was within fifty feet of me, it made a dive for an English sparrow that it seemed to have on the run. The sparrow dodged the hawk's set claws. When the hawk espied my presence, it quickened its speed, but the frightened sparrow darted into a pile of dead leaves on the opposite side of the street, chattering and screaming some sort of rigmarole, known only to avian linguists. When I ventured across the street to visit the frightened bird, it refused to trust me, and flew away and joined the other members of its clan.

The favorite hunting ground for bullbats or nighthawks is the great airy deep that lies over our larger cities. When man began to finish his buildings with flat tops and then cover them with gravel, the bullbat said, "What's the use of going out on the hillside or in the fields to raise our young?" They simply take advantage of the natural appearance of the flat roof and raise their young. Probably their children are safer on the flat-topped buildings than they would be on the ground. The butcher bird has long been employing the sharp thorns on trees for impaling its food, composed of mice, grasshoppers, and sometimes young birds. When man began to stretch barbed wire fences around field and farm, the butcher bird seized the opportunity to employ the sharp barbs instead of thorns for impaling its food. The smooth intervening spaces between the sharp barbs furnished the butcher bird a comfortable place to sit while it dines.

A farmer living in North Georgia had running water installed in his barnlot. The drinking trough was in reach of horses, mules and cows. One mule learned how to turn on the water, but, after quenching his thirst, seemed never to think about shutting it off. This careless practice soon made him a perfect nuisance, and his owner found it necessary to trade him to a neighboring farmer who obtained his water supply from a natural stream.

You do not have to go very far to witness interesting animal behavior, as I have briefly related in this article, for such observations are within easy reach of everybody.

A Day in the Nice of Today

By ANDREE PRATOUCY

A VAST amphitheater of ocher-colored rocks, the last ridges of Montboron and Mount Vinaigrier; a profusion of olive gardens, their soft green foliage creeping over hills wooded with ilex and myrtle way up in the impressive blue sky, real mountains cutting their shadows on the superb pyramids of the Mount Can; yonder the immensity of the Alps resplendent with snow: such is Nice's background, her foreground being the blue Mediterranean, the *féerie* Angel Bay, which lured her first masters, Phoenicians, Massalietes and Romans from their gondolas. On her left, behind a wrinkle of the coast, is dreamy Cannes, disdainful of the honor bestowed upon her by the late Peace Conference; on the right, the marvels of the Route de la Corniche scooped out of the mountain side, whose capricious turns and abrupt curves lead to Monte Carlo and Italy.

How can one tell the beauty of all this radiant world of blue and gold, of azure sea and sky, of sun caresses and balmy breeze, as one drinks it all in? Words are poor in the presence of such splendor. Silence seems to be the only password; silent is the sea softly flapping its wavelets on the beach; silent is the beach rolling its little round "galets" into the silvery foam; and the elegant palm trees merely nod at the mountain breeze, and their leaves twitter only to hush to soft notes the horns of automobiles smoothly running on *Promenade des Anglais.* As to the numerous *caléches,* they were long ago trained to sober down their creaking wheels, and the clear sound of the horses' feet striking the pavement is their only warning of approach.

"Nizza la Bella," as Italians say, "Nice the Beautiful," belted with Mediterranean turquoises, cosily nestled at the feet of the Alps, is Queen of Calm and Peace, of ever sunny days, of undisputable beauty, and worshiped by a court of admirers.

It is five o'clock. This is the fashionable hour, when the élite walk up and down, then down and up, the fashionable *Promenade des Anglais* (half of it is called *Promenade des Etats Unis*). Who are they? Mostly English "Sirs" and "Ladies." Old England is all right in summer, but it must display—*honni soit qui mal y pense*—a rather poor winter, for the whole Azure Coast from Hyeres to Menton has its stations showered with insular "luggage," looked after by golden striped Cook's Agency caps.

This English colony patronizes, of course, the marble palaces which few French purses can now afford. There was a time, before the war, when French and Russian aristocracy, as well as Italian and Balkan princes, used to vie with English "Lords" for the supremacy in elegance. Those whose wealth was solid enough to resist the currency breakdown are still here, but lost in the crown of Oxford suits and London hats. But for how many others, the *"nouveaux pauvres,"* are Nice's beauties only blurred dreams of the past!

But there is another Nice, not so well known, I fear, and this is unfortunate. In the real Nice, you will meet real, "everyday" folk, where you will find true personality and an original civilization.

The old Nice! I went there by the river, not in a boat, but walking in the very bed of the "Paillon," where donkeys graze on green grass and thistles which grow among the stones, where urchins look for little pieces of colored glass, where washerwomen put their laundry to—dry. Yes, the "Paillon" is a river, but there is not a drop of water in it. Yet I was told that sometimes it becomes a ferocious torrent, sweeping away every obstacle. That is in spring, when the huge glaciers of the Alps begin to melt down into waterfalls; but just now the "Paillon" is a rather good highway, where you don't run any risk of getting dust-powdered from automobiles.

Leaving the hospitable "Paillon" for the real concrete way, I went by tortuous stone steps down to a narrow, gloomy street, an entirely new world, a world of color, of songs, of flowers. Quaint yellow and blue and green lattices with only their inferior squares half-open on the street, well bearing their name, *"jalousies"* (jealousy), for jealous lovers can watch below to see whether his or her dark eyes are still glancing toward the lattices where they belong, instead of gazing astray. Such was their use in days gone by, but the "vendetta" ages have gone; at least they have vanished from this industrious little *"Rue du Vieux Marché."*

Queer shops and curious stalls are so mingling their displays that oranges are cascading their glossy gold among the pale gold of olive oil jars, of sparkling honey cakes, even among the deep-red carnations and yellow roses, and fragile anemones of Mademoiselle Anais. With her white silk shawl, her little apron, her original flat headgear, she is this flower girl, the real type of *"Niçoise,"* dark hair, black eyes in which dance with the sun the laughing spirit of the race.

Vividly colored materials hung from balconies obstruct doorways, and give a note of never-ending rejoicing to the place. Where else have I seen such materials! Oh, yes, in the Italian district of a little town in Northern Michigan; but there cleanliness seemed to be somewhat absent, and this old Nice is surprisingly spotless. Of course, the cobblestone pavement shows holes and sufferings—it's so old!—and the numerous mossy fountains need a little scratching on their medieval engravings. But the pavement is still wet with the vigorous morning scrubbing and fountains pour out a clear water to refresh myrtle, lavender and rosemary leaves.

I had dinner at Boutteaux's, in another narrow street of the old Nice, *Rue de la Boucherie.* I went in by the kitchen—there is no other door. I went among cooking stoves, frying pans, oil fumes, without my entrance disturbing any of the white-capped *"marmitons"* (chef's helpers).

Do not think this eating place is purposely a cellar, as Greenwich Village inns are purposely taverns, dens, attics, and what not. No, this is a cellar, not to be an original lunch room, but just because its owner didn't have any other place to sell his delicious *"cuisine niçoise."* Moreover, this is not a place for strangers. I observed that the two delightfully blushing young English lovers, who stepped in just after me, and myself were the only intruders among this gathering of real *"Niçois."* At my own table—my barrel, should I say?—sat a bright-eyed, dark-haired man who talked of nothing but his recent olive crop, his fresh olive oil. I became so interested in his descriptive narration that I almost decided to settle here in this ardent south, just to "pick up olives as tender as rose hearts, Madam, and as juicy as peaches," and to "delight in the sight of the wonderful oil, real fluid gold, I say, Madam."

Was she contented, the woman with a pure Greek profile and pale eyes, my right-hand neighbor? She sweetly asked me to come and see her store. "I have such nice silk stockings and beautiful lace, too. You will love it all." Then she was gone and the olive cultivator told me her Odyssey. She is Russian, and once upon a time was immensely rich. Nice saw her ride beautiful thoroughbreds on the *Promenade des Anglais.* But the torment which swept Russia swept away also her own wealth. She abandoned everything but Nice. She couldn't give that up. So now she is selling silk stockings and lace, under the same blue sky, among the same palm trees, with the same scent of roses floating around. So this modest cellar has also its tragedy.

Don Juan's House High Up on the Hill

Rustic Sage Speaks of Spanish Life

By V. S. PRITCHETT

I AM going to see Don Juan. The driving dust is swirling down the road and blowing up into the faces of the acacias. The sun is grappling with the earth, flinging itself savagely on the bare hills and retreating perceptibly from the scrubby valleys. The wind whips the obstinate plains. One thinks some fantastic drover—a tremendous man in black corduroy with a crimson sash around his waist, a terrible man, tawny and half-shaven, with eyes sharp as rock, and hair as straggly and scrubby as the myriad oaks of Castile, a man as tall as the sky and with shoulders like the hills—stands on two of the Seven Peaks and lashes the winds down from the Sierra and across the plains.

The house of Don Juan is on a hill. Up the white road the jingling mule teams jolt and straggle. One hears the fierce striking of the bells. One sees the restraining harness, the painted holster, the red and yellow trappings. The wheels of the cart are blue and have yellow flowers painted on them. The hood is blue and red and looks like a country bonnet. Stringing from one side of the road to the other aimlessly like vagabonds, gaily like a cavalcade, the team drags on and on, resignedly. It has caught the sullen resignation of the road. The drover trudges, too. He bellows at the leader. The leader turns to the middle of the road again. The drover returns to his trudging and resignation. With heads bowed, the heads of mules and man, the team straggles on. The jingle of the bells becomes fiercer, like the clanking of a chain on the ground. It is the chain which, locked to the feet of man and beast, holds them weightily to the sullen fatality of the road. Out to the pale plains goes the cavalcade, to the barren plains, to the drought, and to the good people, willing slaves.

A mood settles on one when one goes to the house of Don Juan. One *feels* strange revealing sights from his hilltop. One thinks one comes very near to touching something in Spain which is intangible. Don Juan himself knows it. I find him sitting among his olives and vines. A warm, autumnal satisfaction is there. Pepe, the goat-boy, is sitting below on the slope of the hill, with a score of goats eating decorously. The deep, watery note of cowbells drops on the air. They are not Don Juan's cows, but he has the fulfilling happiness of their sound. One hears the grunt of Don Juan's pigs, a little nearer the house, but still, Don Juan's pigs. There is Don Juan's dog. Don Juan is sitting among his olives and vines and is looking at the thirty miles of plain bending away from his hill and disappearing into the flowing forms of the Sierra. He sees the gold and brown and gray of the plains. He sees the keen blue of the Sierra, pale flame, quiet, intense, bringing tears to the eyes, like the kindling edge of a memory. He sees the thin lights of the twilight villages. He sees the turbulent sky, the blurting grays, and the smudging browns and blues, the illogical crimson and the unreasonable yellow of a tumultuous sunset. He feels the teeth of the wind. He sees the frightened silver of the poplars as their leaves stand on end. He sees the reassuring yellow of the thin poplars, the poplars with October in their leaves. He hears the shaking of the olives, the moving of the vines, the skipping of the dead leaves. He sits and shrugs his shoulders. This is his deepest content, his shrug, his joyful indifference.

"Let us go in," says Don Juan. So we go in. The floor of the room has an intellectual polish. The walls are white, speculative. The hundred things one can picture on white walls! Don Juan sits in an uncomfortable chair. Its inexorable carving, those cruel roses and merciless lions, bite into his back. He lights the lamp. We hear the black night wind from the Sierra flinging against the shutter. A door bangs. "That's Pepe," he says. The door flies open. In the hall the wind worries about our hats and coats and Don Juan's bicycle which has been out of order for two years. A thin, long draught sneaks into the room and plays round the legs of Don Juan's trousers.

"As I was saying," begins Don Juan, and then gets up and leaves the room. He comes back with a fly swatter. We talk about the Iberians and the Moors. Don Juan punctuates his sentences and gives some oratorical swing to his words by swatting flies. His talk sings along at a tremendous speed and he uses the swatter as an extra arm for gesticulation. He says, "There you have the spirit of Spanish life. Fighting, struggling, pushing, always a tussle. There is the struggle with the wind which leaps at one from the mountain; there is the fight with the sun which grapples with one like a gorilla. There is the struggle with the rain, with the heat, with the cold, with the glaring light and the black dark. There is an atmosphere of impediment and laboring in vain. Like the mule driver on the road one has the chains on one's feet. One trudges to the sterile plains and tries to tear life out of the splitting earth. One climbs the hillside and searches for a lyric gaiety among the stunted oaks and the marching olives. One lives among the good people. It is unbearable. It is the constant struggle with our decadence.

"I myself," says Don Juan getting up, the words pouring from him like rain, whirling from him like wind, as his arms go round like windmill sails, "I come from the plains from La Mancha, the wide plains of La Mancha. There the towns are like heaps of stones, scattered on the cracking plains, the lives of the people are dried up by the sun and the dust. Their humor is dry and crackles like sticks. You ask a man of Ciudad Real what he thinks today," shouts Don Juan killing a fly on the wall. "'*Hombre*,' he says, 'it is impossible, impossible. That it cannot be, that it cannot be! What shall we do about it? Life goes on. Nothing. Nothing. But nothing, NOTHING!'" he bawls.

"You see," says Don Juan, "it is the struggle with everything; it is the struggle with nothing. That is Spanish life." He shrugs his shoulders, he waves his arms, he sits down on his biting chair, he gets up again and whacks at another fly. He walks with me by the olives as I go away. His crackling voice chases ideas and never stops. He holds his hat on in the black wind from the Sierra. He says his house has a lifelong fight with the sun and the wind. He says he has planted pines round about. He asks, don't I see what he meant before? Always the struggle and the aimless wandering. Must have come with the Moors. No, before that. "We are all Africans," he says. "Wandering Don Quixotes, wandering Columbuses, nomads, gypsies. What is wandering but a struggle with nothing, an avoiding of encounters: just as Loyola did when he let his donkey decide one of the biggest religious problems in history!!"

Don Juan stopped and the black wind pushed away the snapping and crackling of his long voice. "We talk too much," he said quietly. I heard the slow notes of ox-bells on the road. The stars were very bright and near as I came away from seeing Don Juan.

A street in Toledo, Spain

Turning Points in the Life of a Great American

Theodore Roosevelt

By FRANK DORRANCE HOPLEY

WHEN Theodore Roosevelt was 12 years old, his father said to him one day, "You have brains, but you have a sickly body. To make your brains bring you what they ought, you must build up your body; it depends on you."

Mr. Roosevelt, speaking in his autobiography of this turning point in his life, says:

"I felt a great admiration for men who were fearless and who could hold their own in the world, and I had a great desire to be like them. Until I was nearly 14 I let this desire take no more definite shape than day-dreams. Then an incident happened that did me real good. Having an attack of asthma, I was sent off by myself to Moosehead Lake. On the stagecoach ride I encountered a couple of other boys who were about my own age, but very much more competent and also much more mischievous. They found that I was a foreordained and predestined victim, and industriously proceeded to make life miserable for me. The worst feature was that when I finally tried to fight them, I discovered that either one singly could not only handle me with easy contempt, but handle me so as not to hurt me much and yet to prevent my doing any damage whatever in return.

"The experience taught me what probably no amount of good advice could have taught me. I made up my mind that I must try to learn so that I would not again be put in such a helpless position, and having become quickly and bitterly conscious that I did not have the natural prowess to hold my own, I decided that I would supply its place by training."

When Roosevelt was elected to the New York assembly he was virtually unknown, at least in the political world. Three months of the session passed by, and then young Theodore stood up in the assembly chamber and demanded, point-blank, that a certain Judge Westbrook be impeached for the prostitution of his high judicial office to serve the purpose of wealthy and unscrupulous stock gamblers. The *Saturday Evening Post* said of the incident:

"That speech—the deciding act in Roosevelt's career—is not remarkable for eloquence. But it is remarkable for fearless candor. He called thieves thieves, regardless of their millions; he slashed savagely at the judge and the attorney-general; he told the plain unvarnished truth as his indignant eyes saw it."

William Roscoe Thayer tells of the result.

"Astonishment verging on consternation filled the assemblymen, who, through long experience, were convinced that Truth was too precious to be exhibited in public. Worldly wisdom came to the aid of the veteran Republican leader, who wished to treat the assault as if it were the unripe explosion of youth.

"Little did this official defender of corruption understand Mr. Roosevelt. Although the magnates of the party pleaded with him and urged him not to throw away his usefulness, he rose again in the assembly the next day and renewed his demand for an investigation of Judge Westbrook. Day after day he repeated his demand. The newspapers throughout the state began to give more and more attention to him. The public applauded, and the legislators, who had sat and listened to him with contemptuous indifference, heard from their constituents. At last, on the eighth day, by a vote of 104 to 6 the assembly adopted Roosevelt's resolution and appointed an investigating committee. The "young reformer" had not only proved his case, but had suddenly made a name for himself in the state and in the country."

But the great turning point in the life of Theodore Roosevelt came on that summer's day when the bullet of the anarchist Czolgosz laid low President William McKinley. When the news reached him, Roosevelt, then Vice-President, went immediately to Buffalo, but as the surgeons pronounced the wounds not dangerous, he, after a few days, joined his family in the Adirondacks. Let Mr. Thayer tell the rest of the story:

"For several days cheerful bulletins came. Then, on Friday afternoon, the thirteenth, when the Vice-President and his party were coming down from a climb to the top of Mount Marcy, a messenger brought a telegram, which read:

"'The President's condition has changed for the worse.

"'Cortelyou.'

"The climbers on Mount Marcy were 50 miles from the end of the railroad and 10 miles from the nearest telephone at the lower clubhouse. They hurried forward on foot, following the trail to the nearest cottage; where a runner arrived with a message, 'Come at once.' Further messages awaited them at the lower clubhouse. President McKinley was dying, and Roosevelt must lose no time. His secretary, William Loeb, telephoned from North Creek, the end of the railroad, that he had had a locomotive there for hours, with full steam up. So Roosevelt and the driver of his buckboard dashed on through the night, over the uncertain mountain road, dangerous even in daylight, at breakneck speed. Dawn was breaking when they came to North Creek. There Loeb told him that President McKinley was dead."

"In this manner," Mr. Thayer continues, "'Teddy's luck,' brought him into the White House, as the twenty-sixth President of the United States. He emerged triumphant from the receiving vault of the Vice-Presidency, where his enemies supposed they had laid him away for good. In ancient days, his midnight dash from Mount Marcy, and his flight by train across New York State to Buffalo, would have become a myth symbolizing the response of a hero to an Olympian summons."

Charles Washburn, a college friend of Roosevelt, once remarked:

"I would not like to be in McKinley's shoes. He has a man of destiny behind him."

Mapping Out America

How the *Mayflower's* Arrival Was Anticipated

By LOUIS C. KARPINSKI

Waldseemuller's globe gore map with the name "America" upon it.

THE names of cities and countries have a peculiar interest because they are terms which have commonly been transmitted from one generation to another and from one country to another almost without change. The *Roma* of the Romans is *Rome* in English and approximately that even in Chinese. The ancient Egyptian probably had a word sounding quite like our "Egypt" to designate his land, and similarly Babylon was so named even in the ancient days.

So the continents have names also which have been preserved from very early times. 'Asia" and "Europe" are found even as early as Homer while the term "Africa" is first used in Latin, not in Greek, in the time of Julius Caesar. The words America and Australia as applied to continents are necessarily of much more recent origin, since these could hardly be named before they were discovered.

Parenthetically it may be remarked that the name Plymouth appears on a map of New England made by Captain John Smith before any colony was founded there. It so happened that Captain Smith desired to show to the young Prince Charles (later Charles the First who was beheaded) the desirability of colonies in that section of the New World. Upon the map were placed Indian names which proved probably rather difficult for the Prince to pronounce. So with a few strokes of the royal pen good old English names were substituted or sprinkled, one might say, upon the map. In his description of New England of 1616 Captain Smith states that he requested Prince Charles to act as godfather to this section of the new world. Three of these names were actually adopted by later Colonists and in particular the name Plymouth was applied to the first colony, quite close to the site of the fictitious Plymouth due to a princely fancy. New England was first so named upon this map.

New England, then, was first applied upon this Captain John Smith map which appeared in 1616. The Charles River and Plymouth and also Cape Anna are the three names which were later adopted. The name Boston also appears upon the map but well north of the present Boston. For more than a century some of these fictitious names, not representing colonies, were repeated upon maps of this region.

The Ancient World with which our civilization connects had its center in the Mediterranean. Europe was the land of promise toward the west, the land of the Celts of France and the "barbarians" who lived in England. Europe was the "land of sunset." The word "Europa," in fact, is connected also with the idea of "dark," the setting sun. Originally the term was applied to the plain of Thebes which we consider as Far East, whereas in the ancient days it was for Babylon and for Egypt the western confines of Europe.

The word *Asia* on the contrary comes from a word meaning East, and was applied by the poet Homer to the region of Ephesus in Asia Minor. Other writers like Herodotus applied the name to the continent. Both words "Europe" and "Asia" passed from Greek into Latin and by that route into English.

The Greek word for the continent south of them was Libya, a word used in the Bible occasionally in this same sense. However, when the early Romans established colonies in Libya, a native term meaning colony, Afrygah, was applied to the region of Carthage and later to the whole continent.

As you pass out of the Mediterranean Sea by the Strait of Gibraltar, long called the Pillars of Hercules, you observe in Africa on your left a range of mountains, the Atlas Mountains, more than 7,000 feet high. Herodotus baptized this outer ocean with the name of these mountains, as the Sea of Atlas, or in Latin *Mare Atlantis*. In this sea was also placed the fabled isle of Atlantis, which some have asserted was sought by Columbus. Recent historians and geographers incline to the belief that this fabled isle reflects some actual ancient contact of sailors with islands in the Atlantic.

Across this ocean in 1492 Christopher Columbus sailed in search possibly of such an island, or possibly of a passage by water to Asia. In any event he found a new world which might appropriately have been named Columbia after the discoverer. However, Christopher was a better navigator than he was journalist, nor did he enjoy the services of a good press agent, and these facts kept his name somewhat in the background.

Another Italian, Amerigo Vespucci made voyages to the New World and wrote fascinating accounts of the region and its inhabitants. About 1507 Martin Waldseemuller wrote a cosmography or description of the world which was printed in that year at St. Die in Alsace. In this treatise Vespucci's voyages were republished as these had made a great impression upon Waldseemuller. As a scientist and geographer this author recognized that the new world described so vividly by Vespucci displaced the old view of the world as given by Ptolemy. In the text of the cosmography Waldseemuller suggested the name America and further proceeded to make a map incorporating the new world. Upon this map America was applied to the continental area of South America. This designation found favor with the geographer Schoner and with Apianus, whose use of the term in the widely popular Cosmography of 1524 contributed very greatly to establishing the name.

The first map of the New World on which the name "America" appears.

The Cosmographia of Waldseemuller had at least four different editions (or printings) in 1507. In addition, this energetic author prepared the large world map with the name America upon it, and also a globe. The large world map was found some fifteen years ago in Germany. The globe gores, the parts to make a globe, have also been found. Further, a letter of Waldseemuller refers both to the proposed publication of globe and of map, this letter being dated Easter Monday, 1507; and, to clinch the matter, in a letter of February, 1508, Waldseemuller refers to the map and globe as completed and as falsely claimed by others. In a marine map of 1516 Waldseemuller drops the name America but it was too late, the name had already become popular.

In 1513 the adventurer Vasco Nunez de Balboa crossed the narrow isthmus near Panama and on September 25 sighted the great Western Ocean which at that place lies to the south of the land. To this Balboa applied the name, long found upon the maps, Mar del Sur, or Sea of the South. In 1521 that great navigator Magellan passed through the tempest-tossed strait which bears his name and across this western ocean, through peaceful seas. Magellan was so much impressed by the contrast, which was, however, accidental, that he named the ocean the Pacific or peaceful sea. Undoubtedly the fact that Pacific sounds well with Atlantic had much to do with the final adoption, even as America was quickly popular because the word sounded well with Asia, Africa, and Europa.

On the early maps in default of exact knowledge a great continental area was placed in the south polar regions. This was designated *Terra australis incognita*, "unknown southern land." However, in the early seventeenth century, between 1605 and 1642, Dutch sailors discovered and partially explored a large southern continental area. To this was applied the name *Terra australis* on many maps. As late as 1814 a book on a Voyage to Terra Australis was written by the writer Flinders, and in this was

(*Concluded on page 14*)

Map of the New England coast made by Captain John Smith in 1616, on which he marked the name "Plymouth" at a point quite close to the colony of Plymouth which was not founded until four years later.

The Romance of Dorothy Osborne

Concluded from page 9

"Would you think it, I have an ambassador from the Emperor Justinian that comes to renew the treaty. . . . Well, I'll think on't, and if I succeed I'll be as good as my word; you shall take your choice of my four daughters! . . . . He has often inquired after me to hear if I were marrying, and somebody told him I had an ague, and he presently fell sick of one, too, so natural a sympathy there is between us. . . . He desires to know whether I am at liberty. . . . Shall I send him to you? I think that will be best."

Dorothy Osborne lived in an age when women were expressing themselves through the art of letter-writing. Lady Mary Montagu, about this time, was writing her remarkable travel letters, and in France Madam Sevigné was making herself immortal in those wonderful letters to her daughter. She is known as the "Queen of Letter-writers," and our own Dorothy is the Princess Royal!

The exceptional freedom of style and the wisdom in Dorothy's letters reveal that she was not only a gentlewoman, but an educated, well-read woman, who, if she could drop in upon us now, might easily take her place among the leading women of our day. She read French Romances, to be sure, great tomes of them, but she also read travels, such as those of Fernao Mendes Pinto; and the best authors of her time, Waller, Crowley, Lord Broghill, Jeremy Taylor, and others. Her associations were of the best, from the old country families to the Rev. Mr. Gibson, a frequenter of her father's house.

Her letters are remarkably unstilted, for all that one finds an Elizabethan echo in a word now and then, and the quaint swing of a sentence, but they are human.

All Letters Should Be Free and Easy

"All letters, methinks, should be free and easy as one's discourse; not studied as an oration or made up of hard words like a charm . . . . like a gentleman I knew who never would say 'the weather grew cold,' but that 'winter had begun to salute us.' I have no patience with such coxcombs and cannot blame an old uncle of mine who threw a standish at his man's head because he writ a letter for him where, instead of saying (as his master bid) 'that he would have writ himself but that he had gout in his hand,' he said 'that the gout in his hand would not permit him to put pen to paper.'"

Dorothy commented upon books as well as upon questions of the day, all of which might be, with slight change of phrasing, ultra-modern. About books:

"Mr. Waller, they say, is making one of our wars, which, if he does not mingle with it a great deal of pleasing fiction, cannot be very diverting, sure, the subject is so sad."

"Let me ask if you have seen a book of poems newly come, made by my Lady Newcastle? For God's sake if you meet with it send it to me; they say it is ten times more extravagant than her dress. Sure the poor woman is a little distracted, she could never be so ridiculous else as to venture at writing books, and in verse too."

Later:

"You need not send me my Lady Newcastle's book at all, for I have seen it, and am satisfied that there are many soberer people in Bedlam."

Neither was the ubiquitous subject of young people neglected as long ago as 1653, when Cromwell was Lord-Protector, and their "folly" was attributed to the lack of a Court—not the "movies":

"'Tis strange to see the folly that possesses the young people of this age, and the liberty they take to themselves."

The next line shows a tolerance not so evident, always, in our own day:

"I have the charity to believe they appear very much worse than they are and that the want of a Court to govern them by is in great part the cause of their ruin; that were no perfect school of virtue, yet . . . . such as were really discreet as they seemed to be gave good example."

Nor were conjugal affairs left out:

"But is it possible what they say, that my Lord Leicester and my Lady are in great disorder and that after forty years patience, he has now taken up the cudgels and resolved to venture for the mastery? . . . . What an age we live in where 'tis a miracle that if in ten couples that are married, two of them live so as not to publish it to the world that they cannot agree. . . . . 'Tis an idle doctrine for me to preach . . . . but I must confess that I am afraid much of the fault lies in us."

O, Dorothy!

Discourse on Flying Like Birds

She continues that if the wife but have patience, many times trouble might be averted, and cites the case of a kinswoman of hers whose husband was not always himself:

"He would rise in the night and with two bedstaves labour on the table an hour together. She took care every night to lay a great cushion on the table for him to strike on, that nobody might hear him and so discover his madness. But 'tis a sad thing when all one's happiness is only that the world does not know that you are miserable."

"For my part, I think it were very convenient that all such as intend to marry should live together in the same house some years of probation; and if, in all that time, they never disagreed, then they should be permitted to marry . . . . but how few would do it then!"

How like a girl in love—in any age—is this:

"You could not but have laughed if you had seen me last night. My brother and Mr. Gibson were talking by the fire; and I sat by, but as no part of the company. Among other things they fell into a discourse of flying, and both agreed that it was very possible to find out a way that people might fly like birds, and dispatch their journeys; so I, who had not said a word all night, started up at that, and desired that they say a little more on't; . . . . but instead of that they both fell into so violent a laughing, that I should appear so much concerned in such an art; but little they knew what use it might be to me!"

—To fly right off to London to see her lover!

Dorothy and Temple's "crossness of fortune" does not improve, and Dorothy endures all the embarrassment of being not only unable to marry but even to announce their engagement. Temple urges her to marry him and trust to a favorable adjustment; but in her day a woman with her breeding and pride, no matter how deeply she loved, could not marry where there was too great lack of fortune; she expressed herself quite adequately upon the unwisdom of marrying for love alone, and in her sprightly fashion on a neighbor's marrying for a fortune:

"Take heed of being like my neighbor's servant. 'Tis the most troublesome, busy, talking little thing that ever was born; his tongue goes like the clack of a mill but to much less purpose. . . . I admire at her patience and her resolution that can laugh at his fooleries and love his fortune."

As the Christmastide of 1653 draws near, and the great rooms of the old house, never any too cheerful, grow cold and lonely, and the garden wet and dead; her father in his last illness, and Temple's father still obdurate, Dorothy, always so hopeful, becomes discouraged, and writes her lover a pathetic letter, lofty and proud, breaking their engagement:

"I have considered all our misfortunes and can see no end to them, but by submitting to that which we cannot avoid. . . . I think I need not tell you how dear you have been to me, nor that in your kindness I have placed all the satisfaction of my life."

After this decision, which had cost her many days and nights of doubt and misery, she expresses the hope, that, since they have never differed in other things, they will not in this; they will be, always, the best of friends and that she will never cease to love him. Temple is greatly disturbed and writes that he must see her, and evidently asks what her plans may be for marrying, if not to him, for she answers:

"You would know what I would be at, and how I intend to dispose myself. Alas! were I in my own disposal, you should come to my grave and be resolved; but grief alone will not kill."

Will Never Cease to Love Him

"Your father would take it very ill, I believe, if you should pretend to love me better than he did my Lady, yet she is dead and he lives, and perhaps may do to love again. . . . . Think on't and attempt it at least. . . . As you ever loved me, do this."

". . . . I tremble at the desperate things you say in your letter; for the love of God consider seriously with yourself what can enter into comparison with the safety of your soul. Are a thousand women or ten thousand worlds worth it?"

Temple, in spite of all Dorothy's fears of a meeting between him and her brother, comes to Chicksands, the rift is drawn together, a more definite understanding is reached, and Dorothy urges Temple to visit his father who has taken the office of Master of the Rolls in Ireland, their purpose being to marry as soon as an appointment can be found for Temple.

What volumes are expressed in this:

"'Tis but an hour since you went and I am writing you already; is not that kind? . . . . I know you love me and you have no reason to doubt my kindness. . . . Lord, there were a thousand things I remembered after you were gone that I should have said. . . . Can there be a romancer story than ours would make if the conclusion prove happy?. . . . Do you remember Arme and the little house there? Shall we go thither? That is next to being out of the world. There we might live like Baucis and Philemon, grow old together in our little cottage, and for our charity to some shipwrecked strangers obtain the blessing of dying both at the same time. How idly I talk; 'tis because the story pleases me—none in Ovid so much. I remember I cried when I read it."

Did Temple Really Love Dorothy?

In this correspondence, extending over two years, all Temple's letters have been lost, excepting a part of one written while visiting his father in Ireland. The one-sidedness has made us wonder if Temple really did love Dorothy as she thought he did, and as she deserved. Extracts from this fragment lay all doubts:

"For God's sake write me constantly while I am here, or I am undone past all recovery. . . . How willingly would I venture all to be with you! . . . . I know you love me still; you promised me, and that's all the security I can have in this world. 'Tis that makes all things else seem nothing to it, so high it sets me; so high, indeed, that should I ever fall, 'twould dash me all to pieces. . . . 'Tis no vanity, this, but a true sense of how pure and how refined my passion is, that none can ever know except my own heart, unless you find it out by being there. . . . . My dearest dear, adieu."

Dorothy's father passed away soon after Temple left for Ireland, and she was left without a home, her brother, heir of Chicksands, not asking her to remain there. She bade farewell to all friends among the county families and journeyed up to London to visit a kinswoman. Here her life changed from the quiet of Chicksands to one of social gayety. She is still very unhappy owing to her unsettled position and the suspense of affairs in Ireland, which seem not to be going forward as either of them could wish:

"Some company that was here last night kept us up till three o'clock, and then we lay three in a bed, which was all the same to me as if we had not gone to bed at all. Since dinner they have all gone and our company with them a part of the way, and with much ado I got to be excused that I might get a little sleep, but am so moped yet, that this letter will be nonsense. I would fain tell you, though, that your father is mistaken, and that you are not if you believe that I have all the kindness and tenderness for you my heart is capable of. Let me assure you (whatever your father thinks) that if you had £20,000. a year I could love you no more than I do."

At last Temple and his father arrive at an agreement and the young man comes back to claim Dorothy. The last are happy little notes written while she and her companion, Jane (with whom Temple is a great favorite), are in London preparing her trousseau:

"You are like to have an excellent housewife of me; I am abed still, and slept so soundly, nothing but your letter could have waked me. You shall hear from me as soon as we have dined. Farewell; can you endure that word? No, out upon't. I'll see you anon."

"I find my conscience a little troubled till I have asked your pardon for my ill humor last night. Will you forgive me? In earnest I could not help it but met with a cure for it, my brother kept me up to hear his learned lecture until after two o'clock and I spent all my ill humor upon him."

"Now that I have got the trick of breaking my word I will do it every day. I must go to Roehampton to-day, but 'tis all one, you do not care much for seeing me. Well, my master, remember last night you swaggered like a young lord. I'll make your stomach come down; rise quickly, you had better, and come hither that I may give you a lesson this morning before I go."

"Here comes the note again to tell you that I cannot call on you to-night. I cannot help it . . . . I am engaged to-night at the Three Rings to sup and play. Poor man, I am sorry for you in earnest. I shall be quite spoiled. Think whether it were not best to leave me and begin a new adventure!"

They Were Married in London

Here is the end of Dorothy's letters. All was ready for the marriage when a calamity befell her that one who has grown fond of Dorothy through reading all these old, old letters, is unhappy to record: At the last moment she was taken seriously ill with smallpox and, although she lived, her beauty remained only in Lely's portrait. Temple did not waver. He saw in Dorothy more than mere external beauty.

They were married in London in 1655 and spent their honeymoon at beautiful Moor Park, the seat of Dorothy's cousin, Sir Richard Franklin; a great house with a remarkable history, from Cardinal Wolsey to the Countess of Bedford and to Franklin; to it in later years the Temples came again to live, after some years spent in Ireland and also at Sheen Abbey.

It was at Moor Park that Sir William, who had then succeeded to his father's title and had made for himself a place in history by the part he played as England's representative to The Hague, where successful negotiations took place that led to the Triple Alliance, engaged the services of a young secretary known afterward as the brilliant and redoubtable Dean Swift.

Mapping Out America

Concluded from page 13

suggested the name "Australia, as being more agreeable to the ear and an assimilation to the name of the other great portions of the earth."

The Arctic or Northern Ocean is so named because of the northern constellation, that of the Great Bear, under which the ocean lies. The Greek word for bear is "arctos."

"Ocean" itself is an ancient term, meaning greater river, which the Greeks applied centuries before Christ to the waters which were supposed to encircle the earth. "Continent," on the other hand, is fairly modern.

In 1559 an Englishman, Cunningham, defined in his *Cosmographical Glasse*, as follows: "Continens . . . . is a portion of th' Earth which is not parted by the Seas asounder."

So were the oceans named and the great continental areas which are separated by them. Even in the names important parts of their history may be traced in large outline.

Baseball Thrills Past and to Come

Side Lights on the World's Series of 1924

By CARSON C. HATHAWAY

NOW that the baseball season of 1924 has passed into dim history and the spring campaign of 1925 is about to open, we can look back and discover why the past season has been termed the most remarkable ever experienced. Particularly in the American League, home of Ruth and Cobb and Sisler, was the race exciting.

For months, the Detroit "Tigers," the New York "Yankees," and the Washington "Senators" battled for the lead. Finally Detroit dropped to third place. Then occurred the most remarkable sight seen in years. In every city in the league, the fans rose in the stands and implored Washington to win. And when Washington finally did win in a hair-raising finish, there was never a more popular victory.

Then came the World's Series. It can be described only in superlatives. Raving fans paid $1,093,104 to see the battles. More than 300,000 saw the seven games. The President of the United States worked at his office at night to have time to witness three of the contests played in Washington.

When the final game was over, Judge Landis, baseball's famous arbitrator, said, "I regard it as the greatest game ever played. When I got back to my room after the excitement, I had a gallon and a half of water wrung out of my undershirt."

Above the shouts of joy which swept over the capital, there seemed to rise one name and that was the name of Walter Johnson. It was back in 1907 that Johnson first came to Washington. Old men with long whiskers love to tell of the marvelous speed of "the Big Train," how the ball burned like a bullet across the plate.

Through all the tragic years of wonderful performance with a mediocre club, he never gave up doing his level best for the public. Johnson and brilliant baseball became synonymous. He pitched more games and won more games and pitched more shutout victories than any other man who ever wore an American League uniform. In the twilight of his career, Washington at last began to win. And because of his faithfulness all America was happy in his victory.

And how the world does love a winner! The fans gave him an $8,000 automobile bearing the mystic licence number 100,000. Not a ballplayer on the Washington team hailed from the capital. Most of them were young athletes from small towns scattered through the West. But each had a triumphal homecoming. Out in Humboldt, Kansas, the birthplace of the great Walter, bonfires and speeches and blaring bands told the world how proud the folks were of their wandering boy.

When the last game was over, President Coolidge himself issued an official statement in which he remarked that "everyone was *pleased.*" New England conservatism! If wild, unrestrained delirium indicates pleasure, Mr. Coolidge was right. Washington literally went crazy.

Yes, the world loves a winner—and is willing to pay him well. The victorious "Senators" drew individual checks for $5,959.64 for seven days' work, almost as much as a Congressman earns in a year. But greater than the financial reward was the popular demonstration. Never in the history of Washington has famous Pennsylvania Avenue witnessed such a spontaneous demonstration as that which continued until after midnight on the day of the last game.

It is comforting to those who have not yet reached the heights to remember that nearly every Cinderella once sat in a chimney corner. In this connection consider Washington's left fielder, "Goose" Goslin. His real name is Leon Allen Goslin. He came to Washington to play ball in 1921. Such slipping and sliding and misjudging of flies had never been seen before in the District of Columbia. The crowds hooted as only baseball crowds can. The rookie said nothing but played doggedly on.

Presently, he began to hit the ball. How he did swing his war club! Even when he struck out he did it with a whole-hearted vigor that thrilled the multitude. And by the time the World's Series arrived, so had Goslin. He made more than any man on the famous "Giant" team, including three large, fat, juicy home runs. And when the home folk up in New Jersey met in solemn council to present a handsome automobile and a silver bat to the hero of the series, who should the hero be? Who but the "Goose"? Truly, all the fairy stories did not happen in the ancient days.

One of the things the Washington fans learned during the famous series was that a liability is merely a potential asset. To accommodate the vast throngs, a temporary stand had been erected in center field. It reduced the size of the arena. Two of the fighting "Giants" thereupon knocked home runs into these temporary bleachers. Great were the lamentations.

"If only the seats had not been built," gloomed the cynics.

The "Giants" knocked no more home runs there but the next day "Bucky" Harris, the youthful manager of the Washington team, picked out a nice old gentleman in those selfsame bleachers and knocked him a long important fly. In the last game, Harris repeated the performance. And in the dying moments of the final contest, Frank Frisch, star second baseman for New York, hit a screaming liner that bounded straight to the center field barrier. He reached third base and there perished. Had the stands not been built, his hit would have won the World's Series.

A World's Series usually has its mysteries. A merely passable player becomes a hero. A former hero makes some fatal mistake. In the 1924 games, one of the most remarkable things was the hitting of "Muddy" Ruel, the Washington catcher. A fair hitter during the regular season, he allowed five whole games to pass without registering a solitary hit. Nineteen times he marched up to the plate and then back to the bench.

The final game arrived. Seven innings passed. Then, bang! "Muddy" Ruel hit for one base and sent the game into extra innings. Came inning twelve. All over America, countless thousands waited breathlessly! And this time "Muddy" doubled savagely down the third base line and a few moments later dashed across the plate with the winning run.

Only two hits in twenty-one times. But those two hits gave Washington the championship of the world.

But perhaps the most remarkable incident in the whole nerve-racking series came in the final moment of

(C) National Photo.
President Coolidge autographing a baseball, surrounded by members of the Washington World's Championship Baseball Team. At his left is Walter Johnson, king of pitchers. At his right is Stanley Harris, youngest of managers.

victory. Each team had won three games. In the final contest the regulation nine innings came and went with the two teams deadlocked. The tenth inning passed into history with the nervous tension increasing. And the eleventh!

In the last half of the twelfth came the fatal break. A puny little pop fly lifted itself weakly into the air and prepared to settle itself down into the Giant catcher's glove. But the catcher dropped the ball. When Ruel reached second and the mighty Johnson first, the stage was all set for Dame Fortune. McNeely, pride of California, at bat.

A foul! Then a crack from the bat and the ball sailed straight for the third baseman. It looked like an easy out. But in the path of the ball, silent and unseen by the multitude, lay a tiny pebble, the great-great, many times great-grandson of some mighty boulder that ages ago was swept down from the frozen North. It was a pebble with a destiny. For when the skimming ball hit it, the ball bounded high into the air and out into left field. The runner on second dashed madly home.

From forty thousand throats came a roar that shook the very heavens. To the farthest regions of the earth went forth the word that the series was won. The pebble had made it possible. Yet some folk imagine that only the mountains count!

But when the final story of the 1924 contests is recorded, the most dramatic tale will not be one of shouting throngs. There are things even greater than victory. Loyalty, for example! For the most thrilling moment in all those inspiring struggles came not when the home runs sailed over the barriers nor when dashing players turned up sparkling plays.

It came when in the ninth inning of the last game, Stanley Harris, baseball's youngest manager, sent Walter Johnson to the box to pitch for what seemed to be the last time. In that moment there was revealed the picture of a great affection, the romance of a loyalty that persisted in the grim face of probable defeat.

Here was a pitcher who had given his best, a very splendid best, to the great national game. The miracle had happened. His team had won the league pennant. Then the World's Series came! But his mighty arm seemed to have lost some of its cunning. Twice he had gone against the foe and twice he had met defeat.

Over at the edge of the diamond, Zachary, another Washington pitcher, was warming up, Zachary—who had baffled the Giants and had won two games. He seemed the logical one to send against the foe. But for Walter Johnson it was now or never. And Harris never hesitated. The old master of the game might lose again but it should never be said that after so many years he had not been given his chance. So out to the box strode the king of pitchers.

The crowd rose in tribute. They were electrified by the great human drama unfolding before them. It was more than a contest. It was life. Something like a sob seemed to eddy through the vast throng.

Then, sweep went the mighty arm and crash went the ball into the catcher's glove. It was the Johnson of old, not the worn hurler of eighteen seasons. In those last four innings he struck out five of the most dangerous batters in the Giant lineup. Not a runner crossed the plate.

And as all things come at last to an end, so, in the last half of the twelfth inning, Walter Johnson, a great pitcher and the ideal of baseball, stood for a moment on second base and watched the winning run cross the plate. He had reached the goal of his dreams. More than that, he had reached the goal coveted for him by millions of his countrymen. And thus at the end of the greatest inning of the greatest game of the greatest series, the greatest pitcher came into his own.

All this is history. Looming ahead is another season, with sixteen major league clubs and a whole host of minor league teams battling for leadership. The New York "Yankees" still have "Babe" Ruth; George Sisler will again manage the St. Louis "Browns"; "Ty" Cobb plays on and on and on with Detroit; Speaker with Cleveland. There are thousands of old-time fans who care not who wins a pennant but who follow daily the ups and downs of their particular baseball hero. So long as *he* wins, they are content.

Who will win in the big leagues in 1925? Take your choice! Last spring, the critics conceded that Washington would finish close to the bottom. They finished on top. The uncertainty of victory, the chance that *your* team may win, whether it be the Chicago "White Sox" or the Mudtown "Eagles" is what makes baseball the most consistently popular sport in all the world.

It was befitting that after eighteen years in the service of one team that to Walter Johnson should have befallen the honor of pitching the decisive game. At the beginning of that game, Johnson, the Big Train of baseball, had sat alone in the clubhouse, a figure disheartened and pathetic. From his trusty right arm the Giants had wrested two of their three victories. But his will was still with him in the eighth inning as he walked across the field to the pitchers' box, with the score tied.

Here was the most dramatic moment experienced in sportdom during all of 1924. Johnson's reverses had not daunted the fans' faith; they roared encouragement. Through four long innings the crowd's nerves were twisted and their emotions torn. Then came the winning score which brought Washington the first pennant the team ever had. But that victory passed into significance compared with the multitude's appreciation of Johnson's splendid achievement, a trying and happy climax to eighteen years of clean baseball.

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in the papers that the Royal Commission on Food Prices, sitting in London, has found that the Chicago wheat pit still rules the world's wheat prices. When London bakers raised the price of the four-pound loaf from twenty cents to twenty-two cents, it was made necessary by frenzied buying in the Chicago wheat market. "Over there," said one witness, "hotel lift boys, and even girls, dabble in wheat speculation." But look at the bread side of it. There are 45,000,000 of these loaves consumed in England every week. In 1900 they cost seven cents; just before the war they cost 11 cents; in 1919 they cost 32 cents. Then in 1923 the loaves were brought down to 16 cents. Since that time the price has steadily mounted, as conditions here have forced it Jubilation on American farms is paid for by greater pinching in foreign homes. The American farmer does no want that any more than the London worker does. [illegible]es in between. If America is to continue the [illegible] the world she must do two things—make [illegible]rofitable to the farmer and at the same [illegible] American wheat easy to buy. This can be [illegible] by short-circuiting the robbery that comes in between.

I read in the papers that the Shuberts have penalized the Philadelphia *North American* by withdrawing theatrical advertising. The occasion was the disgust with one of the Shubert nasty-nasties called "revues," which Polly Evans, an *American* writer, expressed. The *American* business manager, so it is said, promised a retraction, but the editors said No. It would have made a stronger combination if both departments had said No. When the Business Office takes on a little editorial idealism, and the Editorial Office takes on a little business sense, newspapers will present better fronts to the alien poisoners of the American mind. The whole incident gives me an idea. Why leave all this withdrawal of advertisement to the pornographic Jewish play producers? Why not have newspapers take a hand in it themselves? Why not do a little kicking out of ads for un-American spectacles? In these days of universal advertising, the advertising medium is one of the biggest parts of production. Your home newspaper is a part producer of every play it advertises, just as every newspaper was part bartender when it carried liquor ads. Newspapers saw the point on patent medicines and liquor, and they quit. When are they going to see the point on rotten plays? The Shuberts rub the nose of the Philadelphia press in humiliation. Isn't there enough fellowcraft spirit among the Philadelphia press to take a stand together and compel the Shubert boys to be decent when they come to Philadelphia? That's an idea and will be in practice in this country one of these days.

I read in the papers that the sap is flowing in the trees. Though snow and ice still hold the soil the roots know Spring is on the way. Underground wireless has sped the solar message that the turn of the year has come, and every rootlet is an antenna catching the news and sending it along stalk and reed and bole, aloft to the upper branches. Apparently nothing has changed at all. The ground is dead, the woods are gray, only the screaming jays add a new note to the scene; yet for all the surface sameness a change is being wrought; life is stirring in the trees and in the feathered tribes. The roots know. The birds know. Everything that lives near the heart of nature knows. Yet everything seems the same. It is just so with the affairs of men. Things seem the same, but change is already here; one morning it will be apparent; those who have their roots deep already know.

I read in the papers that James Lane Allen is dead. It brought back the years, the years when one easily entered the land, half dream, half apple-scented reality, through the doors of Allen's fancy, and heard the Kentucky Cardinal and the Choir Invisible, and knew the souls of quiet folk who lived untroubled by the world. I wonder if we could find the door again. I wonder if the apple scent is there. So many other doors have opened since, and life is only for moments as Allen wrote it, and even placid people feel the pull of the world's power. There comes a time when we cannot rest in the quiet nooks, because we are wishing all the world could be there, and we know it cannot. Our own dreams are drab because all men cannot share them, our own comforts hard because so many lack them. If one were a Kentucky cardinal, or if one *were* in the choir invisible!—but one is in the clangorous present, and deep within the clangor are human voices like the sound of many waters, and they are not joyous.

I read in the papers the President's allusion to the present tax burden as socialistic—that is, it nationalized the wealth of the country. A week before, the same allusion was made in the then unpublished *Mr. Ford's Page* which appeared in last week's issue. I don't know when the President's speech was prepared, but the *Page* was in the printer's hands a week before the speech was made. It simply illustrates how practical minds, exploring a question, arrive at the same point. For myself, I had never seen high taxes described as socialistic until I saw the *Page*, but reviewing the necessary path of logic it is perfectly easy to see how the thought is arrived at. Only the *Page* went further than the President's speech did. The *Page* recognized Socialism's promise to redistribute to the people, while no one would claim that the bulk of our high tax payments are so redistributed.

MR. FORD'S page discusses Industry's duty to the public compared with that of Finance.

WHAT is the viewpoint of the Navy on the question of scrapping battleships and concentrating on airplanes? Rear Admiral Hilary P. Jones supplies us with the answer in an authoritative and illuminating manner. He says that the Navy recognizes the great importance of aviation to national defense, but indicates its limitations. What the Admiral thinks of the proposal to create a new department out of the air force is tersely told. (p. 4)

"GET Into the Air, America" is the essence of a plea put forth by another writer for the greater use of aircraft as an aid to business, and for the welfare of the country generally. Do the people know just where this country stands in regard to air equipment as compared with other countries? This is something of which no one can afford to remain ignorant. (p. 5)

IS THE ideal leader one who has brains but lacks training, or is he one who is highly trained, but lacks such natural gifts as initiative and insight. Of course, one with brains must also have experience, and so the question develops fresh angles. There is material for discussion here. (p.6)

WE HEAR a good many persons saying that there ought to be a wider outlook for our boys, that their vision ought to be broadened, and their general knowledge increased. You can read of the means which a shrewd business man took to supply these things. (p. 9)

HOW the scheme for the union of the Methodists, Congregationalists, and Presbyterians has caused disunion in the latter body is told by one who has followed the whole movement closely. (p. 10)

THE people of the United States are proud of their National Capitol; but before this triumph in classic architecture uplifted its majestic dome to the skies it passed through a period of strange vicissitudes, the story of which is now told for the first time. (p. 11)

FEW persons are aware that the Chinese, with their peaceful air, and their fondness for tea and for flying kites, are really a very warlike people. For this there is ample evidence. (p. 12)

MERCURY was regarded by the ancients as the messenger of the gods. His function was to act as letter carrier between Mount Olympus and the earth. But he had winged feet. And this is what you will think the Finnish runner Nurmi has when you read about him. (p. 15)

JUST why there are billions spent in pensions in the United States, and why there are likely to be billions more, is a matter that concerns every citizen. (p. 3)

THOMAS A. EDISON is perhaps the greatest of our modern optimists; but he has usually something with which to back up his optimism. This gives weight to his conviction that it is wholly unnecessary for a man to die even at the age of a hundred. He thinks two hundred will be nearer the mark in a generation or two. His reasons for this belief are good to note. (p. 2)

"Live to Be Two Hundred,"

Says Thomas Edison

Edison Sees the 200-Year-Old Man

No Reason Why Turtles and Elephants Should Beat Man in Age

By ALLAN L. BENSON

EDISON is Edison because he has imagination. What everybody with his eyes will see tomorrow Edison sees with his mind today. He gets a glimpse of many things before they rise above the horizon.

Edison now mentally sees the 200-year-old man. When he comes he will not be the exception—he will be the rule. The average man will live to be at least two centuries old.

A few days before Edison, on February 11, began his seventy-ninth year, he talked to me about the great change that he saw coming in the duration of human life. He seemed to have no doubt about what he saw. He spoke as if it were all a matter of course. It was a matter of course to him because he had thought the subject out. He had taken his bearings and felt that he knew where he was.

"Life is now balanced against environment," he said. "On one side of the scale is our vitality. On the other side are the hostile features of our environment. These hostile features are always trying to kill us. Sooner or later they succeed. They will not always, however, be permitted to succeed. Man will intervene in his own behalf. He is already intervening. He is improving his environment. Just to the extent that he is improving it, he is increasing the duration of his life. He will continue to improve it until he will live with what might be called the minimum of resistance. When that time comes he will live long. I do not place the limit at 200 years. I think the average human being will eventually live more than two centuries."

A Traveling Poison Factory

Edison, in all of his long life, never before said anything so important as that. Multiply the average duration of human life almost by four and nobody now living would know this world. The most tremendous changes in our habits, customs, and thoughts would inevitably follow. Beside such a world, our present earth would seem very poor and very miserable.

I asked Edison what he considered the most hostile feature of the average human being's environment.

"His lower bowel," he replied without a moment's hesitation. "The average human being is a traveling poison factory. It is inevitable that the poisons shall be made, but they should not be carried around. What is kept inside is absorbed and put into the blood stream. Poisons tear down tissue and give rise to a great variety of diseases. I believe that auto-intoxication causes most of our diseases. Get rid of it and we shall live much longer and be more comfortable. And it is possible to end auto-intoxication. It is all a matter of diet and lubrication."

What Edison sees coming—longer life—has been on the way for a good while, but it is coming now more rapidly than ever. During the Middle Ages the average European died at the age of about 21. In those times whoever lived to be 70 became a subject of wide discussion. Twenty years ago, the average duration of human life in the United States was 48 years. Now it is 55. It is said that five years have been added to the average human life within the last ten years. This statement is made in a book, entitled "Scientific Research and Human Welfare," by Professor Franklin Stewart Harris, which has just been published.

Fifteen years ago, a very prominent New York physician told me he did not believe anybody had ever lived to be more than 100 years old. He said he had investigated a great many cases that seemed to disprove his belief without finding a single one that could stand examination. Those who claimed age in excess of a century were usually, he said, ignorant if not illiterate persons and in no case was there a particle of proof to support the claim.

That was fifteen years ago. Times have changed. There are now plenty of authenticated cases of life in excess of a century. Former United States Senator Cole, of California, died in Los Angeles last year at the age of 102. Edison expects to live to be at least 100. At the age of 78 he does not feel that he must be in a hurry about anything. "There is plenty of time," he sometimes says when he is discussing the work he has cut out for himself. "I shall live more than 20 years yet."

Longer Lives Mean Greater Works

Edison, when he contemplates the 200-year-old man, sees a world about as different from this as a world could well be. There is already a tendency among all civilized peoples to reduce their birth rate, but when 200-year-old men and women become the rule the birth rate will have to come down to about a quarter of its present proportions. Not so many persons will have an opportunity to experience life on this earth, but those who are born will have more of it. Otherwise, the struggle for existence would become so great that war would have to redress the balance between supply and demand.

A lower birth rate, in connection with a 200-year average of life, would necessarily imply, Edison believes, several interesting things. Women would have more than 150 years to devote to interests other than home duties. Youth would last long and all other periods of life proportionately long. Youth might conceivably last to the age of 125. Why not? We consider one young now at least until he reaches the age of 35, notwithstanding the fact that the average duration of life is 55.

We see in the case of Edison how much it would free humanity to postpone, by about 150 years, the time for quitting this earth. Edison, with the expectation of approximately a century of life, feels, at the age of 78, that he still has time to plan and do things. How should we feel if, at the age of Edison, we knew that we had about 122 years more in which to work out whatever plans we might have in mind? One of the most serious drawbacks to human existence as we now know it is its exceeding brevity. We spend the first thirty or forty years of our lives learning how to do something, only to discover that we have not much time left in which to do it. Death is thus largely a matter of putting experts out of business. An occasional man, as in the case of Edison, lasts a long time, but the average human being has at birth a present expectancy of only 55 years.

THOMAS ALVA EDISON.

Occupational Change as Rest Cure

Edison has a horror of waste. This horror enables him to realize how much progress is retarded by a duration of life that is unnecessarily short. It is like an excessive labor turnover in a manufacturing business. We spend too much time educating each generation for what we get out of it. Or at any rate, we should get more for what we spend if each generation lived longer. The world is a great loser when a man like Edison dies short of 200 years. He knows his business. Having spent more than 60 years at sharpening his mind, it is sharp. It would be vastly to the advantage of the human race if he could be kept young and at his best for 100 years yet. And the same is true, to a greater or lesser degree, of every other person of ability.

Edison has also given consideration to the effect that 200 years of life might have upon the humble peoples of the world. What might they think of the prospect of 200 years in a coal mine, for instance?

This is a very interesting line of thought. A woman refused to take the Steinach gland treatment, a few years ago, though assured that, at the age of 55, it would put her back 20 years. She said she did not want 20 years more of housework. She had done enough of it.

We may well believe that if the average duration of life were multiplied by four the world would have to give more thought to those who have uninteresting occupations. Millions could not be expected to put up with drudgery for 200 years. Existence on such terms would be intolerable. It would probably be found necessary to put as much as possible of the disagreeable work upon machinery and to shorten the hours of such as must still be done by hand. As a matter of fact, these things are already being done. The world is getting rid of its disagreeable occupations. Men still mine coal, but other men are giving thought to the possibility of burning coal in the mines and transforming its energy into electricity. Little by little the bad jobs are being piled upon machinery and just as certainly the tendency is toward a shorter and shorter workday. By the time we have gradually lengthened life to two centuries we shall have as gradually got rid of disagreeable work and long hours.

Of course, our European friends—particularly the French—would scoff at such a civilization. They already have many things to say about the "mechanical life of America." They affect a certain contempt for machinery. They will get over it. America is not using too much machinery. We are not trying to paint pictures by steam or compose music by electricity. We are doing with machinery only the things that we could not do so well or so easily by hand. The more machinery we use the more quickly we can get our tasks done and turn to something else. It is machinery that now enables us to do our work in seven or eight hours instead of the fifteen that our ancestors used to labor. By the time we have learned how to live to be 200 we shall also have learned how to make life a little more worth while.

Edison, like everybody else, becomes tired, after a while, of working along a single line and turns to something else. After working upon machinery for months he will turn to problems of finance or business to rest his mind, as he expresses it. Most persons are unable to do this. Perhaps that is why so many persons say they would not care to live their lives over again. They have become bored. They have done the same thing too long. Yet life is now so short that it is impossible to choose a new occupation when one has wearied of his old one. It takes too long to prepare and become proficient. Lengthening shadows warn that the night is not far off. But with an average lifetime of two centuries it is conceivable that human beings might find the restrictions upon their desire for occasional change considerably decreased. A business life that extended to 150 years might well be devoted to a half-dozen different occupations, one after another. New zest oftentimes comes with a new job, provided the job be worth while. I know an editor who has recently abandoned journalism—after 40 years of it—and flown at scientific agriculture as he once flew at newspaper work. He had made his mark in journalism, there was really nothing more to be achieved, and he was more or less tired of it, when the idea came to him to abandon the whole thing and do what he wanted to do. Turning to the soil has tapped a new reservoir of energy and interest. One of the greatest advantages of longer life would doubtless be in the increased opportunity it would give to express the various sides of one's nature by changing occupations every thirty years or so.

Why There Are So Many Failures

If one had two centuries at his disposal one might also find it agreeable to familiarize himself with the earth by changing his residence from time to time. What American would not like to live twenty-five years in California, another twenty-five years in the Pacific Northwest, still another quarter-century in the Rocky Mountain country, a similar period somewhere in the South, perhaps twenty-five years in the East and the remaining seventy-five years in the places among the foregoing that he found he liked best?

The more Edison studies man the more clearly he realizes that the greatest of all changes that can come in the world are not in man's environment, but in man himself. This is rather a new view to take of the situation. We have looked upon man as something nearly if not quite fixed, particularly as to his span of life. It seems only yesterday—and it was not ten years ago—that physicians were still calling attention to the fact that while the average human life had been extended the result had been achieved by decreasing infant mortality—that nothing whatever had been accomplished in extending the age of the old. Probably most persons do not yet realize that better diet, better hygiene, better sanitation and less auto-intoxication are enabling even the oldest to become older.

As Edison himself grows older his mind, it seems to me, is directed more toward man and perhaps a little less toward his environment. Edison is now and has been for two or three years engaged in what amounts to a profound study of psychology. He is not studying anybody's books but he is studying people. He is trying to make original observations with regard to the motives and impulses that move men's minds. I take it, from what he has said to me, that he has found a wealth of surprising material and that he is somewhat astounded at the magnitude of the mass of material remaining to be explored.

"We are living in a world of illusion," he said. "Things are not what they seem to be. Men do not do as they do for the reasons that we think impel them to action. They oftentimes have quite different reasons. One reason there are so many business failures is because business men do not understand human psychology."

Eyes That Become Searchlights

Edison paused a moment and then added:

"A first-class business man is the rarest thing in the United States."

Edison looks little if any older than he did when he was 60. He weighs 182 pounds which may be a very little more than he used to weigh; perhaps not, but it seems as if his face is a trifle fuller than it was years ago. His color is good and his eyes are as luminous as of old. Edison has the most remarkable eyes; there is not another set like them in the whole world, as far as I know. They are unusually large, but it is not even their size that makes them so remarkable. Their uniqueness lies in the impression they give of a powerful intellect shining out through them. Whoever has watched Edison's eyes when his mind is working at high speed has seen something worth while. They are like searchlights.

Two hundred years would not be too long a life to suit Edison. He likes to live, he likes to laugh, and he likes to experiment. And, next to finding out what is so, he likes to find out what is not so. Having become convinced that it is wholly unnecessary for man to die even at the age of a hundred he does not place the limit at two centuries.

"There is no reason," he said, "why turtles and elephants should outdo man in the matter of age. Turtles live to be 200 or 300 years old and elephants the same. We shall yet do as much."

Billions for Pensions—And Votes!

One Person Out of Every Twenty-five to Share in Uncle Sam's Bounty

By AARON HARDY ULM

"I VENTURE the prediction," said President Harding in vetoing a general pension bill about two years ago, "that with such a precedent established (as carried in the bill) the ultimate pension outlay in the half-century before us will exceed $50,000,000,000,"—that is, a billion dollars a year for Federal pensions for fifty years to come!

Students of the subject say that the prediction was a conservative one. Even without the precedent which President Harding prevented being made—at that time—the Federal Government very probably will spend on pensions, during the period of the generation now emerging, much more than the sum mentioned. Some predict that these expenditures will amount to from seventy-five to one hundred billion dollars, even though no other war adds to the present most numerous pensionable class. And the money cost is not the most significant phase of this prospect. The most significant phase is that having to do with voting.

Federal Government pensions for wars that have occurred will not end in fifty years. Pensions for wars now past will cost more fifty-five years hence than they do now. Expenditures for pensions for wars that already have occurred will be made probably 150 years hence.

Independence War Bill Now Closed

The last pension on account of the War of Independence was paid in 1910, *nearly 130 years after that war ended.* The stipend went to an aged woman whose father fought in the Revolution.

The War of Independence is the only one of ours whose pension accounts have been closed.

On June 30, last, 33 persons were drawing pensions on account of *the War of 1812.* On the score of services rendered in the Mexican War, *eighty years ago,* 1,347 persons, mostly widows of veterans, were drawing pensions.

Yet pensions for the above wars have cost next to nothing when compared with what Uncle Sam has spent and is spending on account of later wars. Pensions for the War of Independence cost the Federal Government, during nearly 140 years of pensioning on account of it, only $70,000,000—not much more *than is paid now each month* for pensions or what is tantamount thereto and their administration.

In fact, many more persons are now engaged in administering pensions of all kinds than were ever on the Revolutionary War pension rolls at any one time.

Pensions for the War of 1812 have cost only $46,000,000, just about what it is costing annually to administer Federal pensions of all kinds.

Pensions paid to date on the score of the Mexican War have cost only $56,000,000.

These sums are mere trifles compared to the nearly $750,000,000 one now absorbed annually by Federal pensions or equivalents.

It is not the purpose of this article to question the merit of any class of pensions paid by the Federal Government. As a whole our pensions are meritorious expressions of appreciation from a grateful people.

The figures above show that *early America was very, very careful about the granting of public pensions.* When, thirty-five years after the War of Independence, Congress provided for paying small service pensions to indigent survivors of that struggle, there resulted a national sensation, the record of which still figures in the histories of the period. When on two occasions during the last three years Congress enacted bills which would have added from fifty to one hundred million dollars to outlays for pensions on account of wars prior to the last, the newspapers gave but a few lines to reports of the transactions.

Early America, while suspicious of them, was not opposed to all forms of pensions. The First Continental Congress decreed that pensions should be paid to persons disabled and to the dependents of those who lost their lives while serving in the Revolution.

Not until 1818, however, did Congress provide for paying anything like general service pensions to surviving Revolutionary soldiers. Payments then were to be limited to ones in need.

All and Sundry Get on Pension List

Under this first general service pension act, 27,948 persons applied for admission to the rolls. *This number was greater than that of Washington's army at any one time.* About 18,000 of them were put on the pension lists. Later it was found that the claims of one-third of these were fraudulent.

"Men who never served at all, or for only very short periods," says a historian, "men who had given away their property to their children or conveyed it in trust for their benefit—in short, every one who was old enough to have served in the Revolution found little difficulty in getting on the pension lists."

The scandal caused Congress, in 1820, to pass what is known as the "alarm act," so called because of the alarming scramble for pensions which had taken place. This act led to 8,000 names being struck from the pension rolls.

Insofar as the writer's researches show, this is the only "step backward" ever taken by Congress in the matter of pensions. Virtually all of the pension bills passed since that time have had one or both of two ends in view—more and bigger pensions.

Pensions, however, never mounted hugely in national affairs until after the Civil War. And despite the big place that alleged "pension grabbing" occupies in the history of the time, cold statistics show that during the twenty-five years following the Civil War pensions amounted to little as compared with their huge increase in later years.

For the first five years following the Civil War, the Federal Government paid out for pensions of all kinds only $117,201,584. That is, that aggregate amount reached the beneficiaries. Administration cost from five to six hundred thousand a year in addition.

> One out of every 150 persons in the United States draws a pension.
>
> One out of every 25 persons in the United States is receiving or has been promised a pension.
>
> Other pensions and doles for the at present unpensioned classes are being asked for.
>
> Three thousand pensioners of our government are foreigners who have never seen America.
>
> Civil War Pensions have already cost more than the amount both North and South spent on the War.
>
> In 1872, it was said that the pension peak had been reached. It was said again in 1902. The pension peak goes up all the time.
>
> We paid pensions on account of the War of Independence until 1910—a period of 130 years. We are still paying pensions for the War of 1812 and the Mexican War.
>
> The number of pensioners and civil employes is greater than some elected presidents have received as a plurality vote.

In 1872 the Commissioner of Pensions declared that *the peak had been reached.* And during that year less than $30,000,000 was paid to pensioners on account of all wars up to that time.

But the peak had not been reached. The amount thus expended moved upward from then on, the increase being checked only recently by President Harding and again by President Coolidge vetoing a bill which would have accelerated it immediately.

The number of pensioners increased, too, until those handled by the Bureau of Pensions reached the peak in 1902, when 999,448 were on the rolls. These were not all Civil War pensioners, but most of them were.

When Harding Vetoed a Big Bill

The total cost of Federal pensions in 1902 was $140,000,000.

Again it was announced, by one no less than the Secretary of the Interior, that the "crest" in cost as well as in numbers had been passed.

Yet in 1923 the same classes of pensions cost $263,012,500, though the number paid was only 539,756. This was because the amounts paid most of those on the rolls had been regularly increased, though admission to the rolls was made easier, as in the case of Spanish-American War veterans.

The cost of these classes of pensions decreased about $30,000,000 during the last fiscal year. On June 30, there were still on the rolls 399,951 Civil War pensioners, 146,815 of whom were survivors. There also were about 100,000 Spanish-American War pensioners on the rolls. These are increasing, while the Civil War pensions are decreasing at the rate of several thousand a month.

The bill vetoed by President Harding would have added about $100,000,000 to the sums going to pensioners on account of wars prior to the last one. It would have raised the minimum pension of Civil War veterans from $50 to $72 a month, and that of the Civil War widow from $30 to $50. All Civil War survivors are now qualified for pensions. Widows, however, are not qualified unless the marriages took place prior to June 27, 1905. The bill vetoed by President Harding would have permitted women to qualify for Civil War widows' pensions on the basis of marriages at any time prior to June 27, 1915, or at any later time, provided the applicant had lived with the veteran for as long as two years—even if she had lived with him though not formally married to him. Already there are on the Civil War widows' roll several hundred women who are still in their early forties. This bill would have permitted women born forty years after the Civil War to have qualified for life pensions of $50 a month as widows of Civil War veterans.

The bill vetoed by President Coolidge did not go so far as to widows but to the same extent as to survivors. Both bills carried increases for Spanish-American war veterans.

No doubt a similar bill will be pressed upon the next Congress. The last one missed passage over the President's veto by only two or three Senate votes.

Civil War pensions have cost to date about $6,500,000,000, and will cost one or two billion more before the last one is paid. It is estimated that *the cost already has exceeded the expenditures by both the South and North on the conduct of that war.*

However, the cost will never be, proportionately or otherwise, as great as the prospective cost of World War pensions.

To date all but a few World War pensions have been called by other names, such as "compensation," "allotments," "allowances," with "adjusted compensation"—which, however merited, is in every sense a service pension—to come. Expenditures on rehabilitation and hospitalization are for temporary or additional pensions in the form of service rather than cash.

The new system was adopted to obviate the pension scandals of old. However, it has cost to date about one-third as much as Civil War pensions have cost—or more than twenty times as much as all pensions cost during a similar period of time following the Civil War.

The Veterans' Bureau has spent in lieu of old-style pensions about $2,500,000,000, upon something like 1,000,000 beneficiaries. Many of these, however, are not now on the rolls, as, for instance, the dependents who received allotments during the war. There have been filed to date nearly one million claims for compensation—which is the new form of disability and death pension—and of these nearly 500,000 have been allowed. A great many of these have been eliminated, through restoration of the applicants or because it was found that they had been allowed improperly.

It is all but impossible to say how many persons are getting what are tantamount to pensions, in either cash or service, from the Veterans' Bureau. Nor is there any good estimate in terms of money as to what they are getting. This is because the cost of administration is so mixed with the cost of aid rendered that no one can tell definitely what goes to the veterans and what goes to the army of administrators who handle funds provided for them. The number is around a half-million and the funds spent annually about $450,000,000.

An interesting calculation was made several months ago by Senator King, of Utah. He showed that appropriations to the Veterans' Bureau had amounted to $2,400 for every compensation claim that had been made—that is, a pension because of death or disability—on account of the World War and to about $5,000 for every one that had been granted.

Most Demands Have Been Granted

The "adjusted compensation" bill makes it certain that what are equivalent to World War pensions will cost from a half to a full billion dollars for each of the next twenty years—in fact, in all likelihood the cost will average a billion dollars or more a year for the next fifty years. This, even though old-style pensions are not granted, as in all probability they will be before many years.

The new policy goes beyond the old in several basic respects. Being called by other names, several forms of World War pensions are given the status of property rights. "Adjusted compensation," for example, can be willed away like other property, even to the deprivation of dependents. In some instances a person may draw more than one pension, as in the cases of some women who draw pensions on account of husbands who served in the Civil War and compensation on account of sons who served in the World War.

The age-old meaning of a pension implies gratuity and not indemnity, excepting perhaps those given for disability or to the dependents of soldiers who lose their lives. The old laws, often "exposed" for their excessive liberality, took care to preserve this distinction.

It is the nature of pensions, once they are granted on a large scale, to expand—that's one reason why the country for a long time was chary of them. It is but human nature for the run of pensioners to be dissatisfied with the amounts received and when their numbers are large it is but political nature for Congress to give them whatever they demand.

During the last forty years most of the demands made by Federal pensioners have been granted—not always at the time but ultimately.

Every sane person knows the chief reason: *votes.*

"My vote on the ———— pension bill," a Congressman declared openly a few years ago, "increased my majority by 10,000."

Many pensioners are prone to think lightly on all other public questions except pensions.

The political influence of pensions may easily become a more important factor than the money cost, no matter how large.

Pensioners frequently are numerous enough to decide elections, and have sometimes done so.

It is all but a political truism that no member of Congress ever gains votes by opposing pension demands, no matter how extravagant; that opposition to any kind of pension bill always subjects a Congressman or Senator to serious political risk.

Where Abuses Have Been Conspicuous

In addition to pensions granted by general law, thousands of new ones, or increases, have been granted to individuals by special acts making exceptions in their cases.

Millions of Uncle Sam's pension funds go to foreign lands, for neither residence in nor citizenship of the country is a necessary requisite for one otherwise qualified getting a pension. On the old pension rolls there are something like 3,000 persons who live in other countries. *Some have never even seen America.*

While the claims of most pensioners are valid, the process of getting pensions has been, as a rule, so easy of utilization that thousands whose claims were in the main imaginary have been able to get on the rolls.

Abuses have been most conspicuous in the matter of disability pensions rather than in that of persons with no claim at all being enrolled.

Cases like that of the man who received $100 a month for total disability while serving as Commissioner of Pensions and in other high Federal offices have not been uncommon.

A recent investigating committee found that more than 800 employes of the Veterans' Bureau were drawing,

(Concluded on page 12)

This Talk of "Scrapping"

Admiral Gives the Naval View About Airplanes

EDITORS' NOTE—It is now recognized that all the talk about scrapping battleships in favor of airplanes was pure folly, and that the proposal to establish the air service as a separate military department is not feasible. But it is now generally acknowledged that the air service has been neglectfully treated, and that it has a right to greater support in its experimental development. The answer of the airman to the statement of the obvious present limitations of aircraft is—"Give us the means to go on experimenting. We can overcome these limitations."

This article gives an authoritative Navy view, and contains material essential to any balanced opinion of the matter. It represents a friendly view of the place of aviation in national defense.

By HILARY P. JONES, Rear Admiral, U. S. N.

A QUESTION of vital interest to the American people at this time presents itself in the pending discussion as to whether we shall have one combined independent air service. Simply stated, this means: shall we combine in one independent department the various air forces of the country? The consequences of the final decision on this question will perhaps be more far-reaching than most of our citizens realize. There are, of course, those who think it would be the best thing to do because of the commercial possibilities of aircraft. But in considering the advisability of an independent air service, the United States Navy is naturally interested from the viewpoint of national defense, and it is from that viewpoint that I discuss the question.

The Navy recognizes the great importance of aviation to national defense. The potentialities of aircraft both in the strategical and tactical operations of the fleet are very great. Scouting planes will prove a valuable asset to a fleet because of the fact that they can cover ocean areas quickly, within the limits of their operation, and would be an aid to the scouting radius of surface craft. The aid that a highly trained observer in an observation plane could give to a commander-in-chief in the event two hostile fleets were approaching each other might be very valuable. It is possible that the commander-in-chief, acting on information from aircraft, could place his forces in such manner as to decide the results of the action. Aircraft is recognized as indispensable to the fleet in assisting the control of gunfire by observing and reporting the fall of shot, technically called "spotting." This aid of aviation has already greatly increased the accuracy of gunfire, and will doubtless further improve the accuracy of firing. The firing range of a battleship was formerly restricted to the limit of vision from the fire control tops, but now the aircraft "spotter" can obtain a closer and more vertical view of the target and shell splashes than is possible from the firing ship. Further, the aviation "spotters" naturally increase effective gunfire well beyond the range of vision from any spotting position on the ship itself. There can be no question as to the value of aircraft to the fleet, and instances of this nature would be but cumulative argument. As before stated, a campaign of exaggeration and misstatement is not necessary to demonstrate the vital importance of aviation to national defense.

The question therefore takes this form: What is the relative importance of aviation as a means of national defense? Does its importance merit the creation of a new department and the establishment of an independent air force? Has aviation brought forth a new method of defense that will render possible the abandonment of our Navy? There are those who picture in fascinating language the ease with which an airship can destroy a battleship. The bombing of the *Ostfriesland*, that old German battleship, and two or three of our own old battleships has been the occasion of some false conclusions as to the vulnerability of modern battleships to air attack. It should be borne in mind that the ships bombed were of obsolete construction, and the watertight integrity they originally possessed was largely violated by water-tight doors being left open and watertight bulkheads pierced, and naturally no personnel on board to handle pumps, or otherwise serve the vessel. Further, the attacking aircraft was not hampered by a defensive aircraft force or anti-aircraft artillery. Aircraft can do great damage to surface ships, within the radius of their operation, if they are allowed to carry on their operations *without opposition*, as at the bombing of these old ships; but it must be borne in mind that the aircraft policy of any nation takes into consideration the question of anti-aircraft defense, both by aircraft and anti-aircraft artillery.

(C) Harris & Ewing.

ADMIRAL HILARY P. JONES.

Admiral Hilary P. Jones, Chairman of the Executive Committee of the General Board, that part of the U. S. Naval organization which acts as a general advisory committee to the Secretary of the Navy, was born during the Civil War, in Hanover County, Virginia, November 14, 1863. In 1880 he was appointed naval cadet.

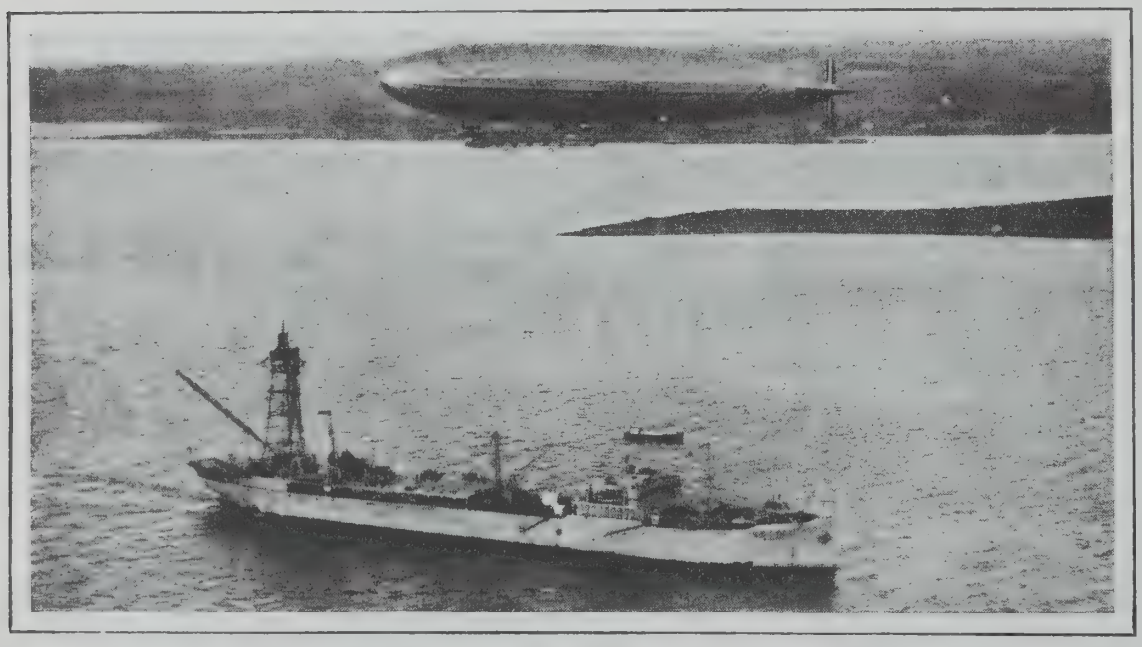
Upon graduation Jones was sent to the North Atlantic Station, first serving on the U. S. S. *Swatara* and later performing coast survey duty on the U. S. S. *Bache*.

In 1888 he was ordered to the U. S. S. *Nipsic* which, on March of the following year, miraculously escaped destruction in the Samoan disaster.

During the Spanish-American War Jones served on the *Dorothea*, a converted yacht, sent to join Admiral Sampson's fleet for patrol duty. Sea duty in various stations at home and abroad followed, with several years in the Philippines and as Superintendent of the Naval Gun Factory at Washington.

During the World War several important assignments were given Admiral Jones.

In December, 1922, Admiral Jones was selected for the highest command afloat—that of Commander-in-Chief of the U. S. Fleet. In August of last year, he was ordered to the Navy Department as Chairman of the Executive Committee of the General Board, where he helps outline the policy of the U. S. Navy.



U. S. S. *Shenandoah* mooring to U. S. S. *Patoka* at Newport, Rhode Island.

Douglas Wright SDW-1 scouting plane combat.

The Navy does not allow personal ambition or any other cause to blind it to the inherent limitations on the performance of aircraft. Such limitations are determined by physical laws from which there is no escape, as far as science can foresee, with materials now known to man. Heavier-than-air craft requires speed of motion to remain afloat in the air. The steam engine or the automobile can stand still on the land and the ship on the water, but the airplane cannot stand still in the air. It must move at high speed or come to earth. The gross weight of a plane, that is, the total weight of a plane fully loaded, is made up of the weight of the plane, power plant, personnel, fuel, lubricating oil, cooling water in case of water-cooled engines, controls and military load (machine guns and ammunition, bombs or torpedoes, radio, stores, and so on). Of these, the disposable weights are made up of personnel, fuel, lubricating oil, and military load. Endurance of the plane, that is, the distance it can fly, depends upon the weight of the fuel and lubricating oil carried relative to the expenditure an hour at economical cruising speed. The military efficiency of the plane depends upon the military load carried; the more weight of fuel that must be carried to reach the object of attack, the less weight is available for military load; and the heavier the weight of the military load necessary to accomplish the object, the less weight is available for fuel. It will be seen, therefore, that the farther the plane must go the less it can do in a military way, and the more it prepares to do militarily the less distance it can travel.

I have noted statements to the effect that an airplane of a given type had a cruising radius of so many hundreds of miles, and in the same paragraph I have noticed the statement that such an airplane could make so many miles an hour, and the further statement that such an airplane could carry so many bombs weighing so many hundreds of pounds. The paragraph was so framed as to give the general public the impression that here was a *super-airplane* that could perform *all* of these things *at the same time*, when, as a matter of fact, *it could not perform any two of them at the same time.*

There is a point beyond which the airplane cannot be developed to do useful work because the larger the plane, the heavier, therefore, the plane, and the less disposable the load it will carry, the less distance it can fly. Commander H. C. Richardson, who is recognized in the scientific world as a designer of reputation and a qualified aviator, states that a plane weighing forty or fifty thousand pounds marks the limit beyond which increase of size would not be profitable. It is the expert opinion of such scientists as Dr. S. W. Stratton, president of the Massachusetts Institute of Technology; Dr. F. W. Durand, of the Leland Stanford Junior University, member National Advisory Committee for Aeronautics; Dr. D. W. Taylor, secretary National Advisory Committee for Aeronautics; Dr. J. S. Ames, professor of Physics, Johns Hopkins University, chairman Executive Committee National Advisory Committee for Aeronautics; Dr. G. W. Lewis, director of Aeronautical Research, National Advisory Committee for Aeronautics; Professor E. P. Warner, head of Department of Aero-Dynamics, Massachusetts Institute of Technology, and many others, that the limits of performance of airplanes as given by Commander Richardson are substantially correct, although some of them consider that he is somewhat optimistic in his upper limits. Indeed, some consider that after forty thousand pounds, the radius of action rapidly decreases. An illustration of the relation of load capacity to radius of action is found in an airplane now building for the Navy in which it is hoped to make a non-stop flight from San Francisco to Honolulu, a distance of 2,100 nautical miles. If contrary winds of any appreciable extent and force are met, the plane may not be able to complete the flight. This is a plane of 24,000 pounds. It can start its flight with no disposable load whatever beyond the fuel, oil and personnel required to fly this distance. According to the best service design and operating conditions known, at present, a machine of 50,000 pounds under the same conditions might fly 2,600 miles, or 500 miles farther, but in such a flight these planes are limited as above to only their operating personnel, fuel, and lubricating oil. No juggling of figures nor mental prestidigitation will change these results.

Airplanes cannot fly across the Atlantic or across the Pacific to any points on our coast or in our continental territory with any military load sufficient to do serious damage. The only possible way they can reach us is by being brought over the sea to within striking distance of our coast, on surface carriers. It will be the duty of the Navy in the unfortunate eventuality that war should come upon us from overseas to see to it that no carriers of heavy-duty planes are permitted to come within striking distance of us. That the Navy may fulfill this duty, all of the means known to modern science must be employed and must be kept to the highest point of efficiency. This naturally includes an adequate supply of aircraft for all ships capable of efficiently carrying and launching such aircraft. It has been stated in the public press, by some individuals who are in a position to know better, that aircraft may be transported in and supplied by submarines. The operation of planes from submarines has been investigated and found inexpedient. Submarines as a service of supply for airplanes on a large scale will not be practicable, due to the limited space in submarines that may be allotted to cargo carrying even in the largest size so far developed. From what has been stated above, it is evident that airplanes cannot furnish

Time to "Get Into the Air," America!

World Now Awake to Uses of Aircraft in Peace and to Preserve Peace

By ERNEST JONES

TIME is money. Time flies. Let business travel on the wings of the wind. Centuries of time can be saved to the business men of America.

Africa, Argentina, Austria, Australia, Czecho-Slovakia, Colombia, Denmark, England, Finland, France, Germany, Holland, Hungary, India, Italy, New Zealand, Poland, Rumania, Russia, Spain, Sweden, Switzerland, Turkey, and the puny nations of the earth are today flying to work. Every one of these countries is using aircraft for travel and for the transportation of mail and goods. Spain is preparing an airship route to South America and England is building the greatest airship for service to India.

"America first in the air." Huh! Even the "Sick Man of the East" is getting better by air.

When we consider where the business man, the banker, the farmer, the grocer, the lawyer, the merchant, can use aircraft to advantage, we think first of transport.

There's a certain percentage of men in all walks of life who must get from one place to another. Some go by boat, others by rail. A smaller number finds the extra-fare trains important. A still smaller number—though sufficiently large—would doubtless find aircraft indispensable, did we have them to offer.

In Europe, where distances are comparatively short, where interstate traffic is less than in America, where time is not such an important factor as with us, where mail-order merchandising is not so well developed, and subsidized air lines are supported for political reasons rather than directly for profit—business men are using the airplane in commercial life to get themselves, their valuables, mail and newspapers from one place to another in the minimum of time. They would use the airship were one in commercial use. They did use it to capacity in Germany until the World War.

What Other Countries Are Doing

In the last five years, airplane air routes have covered 20,110,700 miles, or more than 800 times around the earth at the equator. There have been transported 121,496 passengers, 7,144,570 pounds of mail, and 7,600,000 pounds of goods. More than 8,500,000 miles are being flown this year—and these figures do not take into account miscellaneous flying for hire, for pleasure, or the flying of army or navy men.

On British lines last year the number of passengers carried was 54,240, one and a half times the travel of the year before, and that year bore the same relation to the year before that. The same is true of French lines. More than fifteen thousand persons crossed the Channel by air last year. Did all these Channel trippers pay $60, or whatever the fee now is, merely for the thrill, if thrill there is?

C. M. Ripley, of the General Electric Company, comes home from Europe and says he traveled 5,000 miles on the ocean, 2,000 miles by air, and only 800 miles by railroad. He couldn't ride an airplane an air transit mile in America if he had to go to jail.

The airplane isn't merely a passenger carrier, however. The volume of goods transported by air in France and England has increased two and three times over that of the year before. British air imports and exports by air total $3,410,242, with a great annual increase.

British cross-Channel planes have been increasing in number faster than the passenger traffic warranted. Merchandise by air! There's no sentiment here. There's more profit in goods traffic.

Air transport has taken its definite place in almost every other country of the world. Europe is a network of great organized uniformly operated airplane routes. And they operate. Financially burdened Europe sees a future in the air—for national security and the transport of persons and parcels; and forthwith makes flying an everyday mode of communication.

Closer relationships mean better national understandings. The airplane's contribution to world peace may be greater than we realize.

But why not in America?

America, by nature, the chosen spot of all the world for civil air travel and goods transportation, with her far-flung territories and insular possessions, her great centers of population and industry so widely disposed, with her push and energy—and behind the times!

But Why Not in America?

When a business man can go by air between New York and Chicago, for instance, in 8 to 10 hours in greater comfort than in the 20 of extra-fare trains, will not some adopt the faster way? Even at a still increased rate? There would seem to be no argument. That for the airplane. The New York-Chicago airship fare will be no more than for train service, taking time into consideration.

Would anyone in a hurry to get to Frisco—and there's a lot of us in a deuce of a hurry—argue between the train and the airship when it's a matter of 5 days against 30 to 45 hours by air? Chicago to London in 2 days—engineers' figures.

But think of the documents and papers, small express—all with the speed of the telegraphic night letter.

Is the safety factor uppermost? In two and a half million miles of airship operation during the World War the British lost not a passenger. More than forty thousand passengers were carried on German passenger routes and not a person injured—and in hydrogen airships. In America we have helium, an absolutely non-burnable gas.

The airplane furnishes a still faster means of communication. The flying time of the air mail from coast to coast, picked at random from the records, is 29 hours and some minutes. Let's disregard the minutes when days are being saved. The Post Office has shown that it can be done in a hurry in 26 hours.

Safety in the airplane? Two million miles—fourteen months of operation—without a fatality in the air mail. Two and a quarter million miles on French lines with but three accidents; British cross-Channel routes had no fatalities to passengers in 630,000 miles. On the Cairo-to-Bagdad air line of 1,500 miles accidents are unknown. Germany has eliminated casualties from commercial flying. In the past five years of flying on British and Dutch air lines the passenger-miles a passenger fatality were 2,663,300—not far behind the record of a big New England railroad where the train miles a passenger casualty were 4,400,000.

One can always get insurance. There is no longer any apprehension as to commercial flying—in Europe.

Reliability? Certainly, we must have that. Though the extra-fare trains are paying refunds for damages to the schedule we can't be taking chances with the airplane schedule.

The United States Air Mail schedule calls for some 2,000,000 miles a year and the Post Office planes are now flying the ten-millionth mile. More than half of these trips in the last five years were made in rain and snow, hail and fog when terrestrial locomotion was embarrassed and we left the "flivver" at home in the morning. For the last year the percentage of trips completed of those scheduled was 96.39. The percentage of performance has crept higher and higher every year. During the last three summers, when air travel on European routes was found to be heaviest, the United States Air Mail operated at 100 per cent efficiency. That's perfect. French lines maintained 98 per cent, Britain 88 per cent, Germany 90 per cent, Denmark 92 per cent; Russia is practically perfect.

Trains arriving on schedule in New York State in the last ten years averaged 81 per cent.

There is always an urgent demand in some one place for something from another. An industrial plant needs a part of its machinery; it faces a loss of production if not a shutdown. What premium is offered for every minute saved?

News while it's news. The airplane in news-gathering—privately owned or operated by service companies. It not only reaches the spot first but furnishes news that is in its own special class.

George Murray, staff photographer of the Boston *Journal,* recorded on June 26, 1914, the first known instance of news illustration from aircraft. He photographed the fire which destroyed a large part of Salem, Massachusetts. This one picture furnished a more vivid realization of the devastation than any text could give. Pictures are news. The last international yacht race was filmed from the air by a New York newspaper employing a commercial air photographer. News photos and reel films have been carried all over the country by air in past years.

Photography From the Clouds

This air photography is an established business now. A few concerns are actively engaged in it, making mosaics of cities, of estates, photographs of real estate developments and projects of various kinds for governments, municipalities, companies, and individuals. The field here is wide.

Lots of things happen in out-of-the-way places. The news is brought by telegraph. If sufficiently important, special correspondents are dispatched by terrestrial means. The chances for a "beat" are about even.

Enterprising newspapers can now have their airplanes and pilots at the municipal flying fields—and cities *are* getting them. Look at Hartford, for one example. She has her extensively equipped aerodrome and others have followed in her wake—the air line to the scene and the story by wire a day or days ahead of the earth-bound competitors; the picture by air while the reporter remains to cover the rest of the story with a follow-up as still another beat.

Of course, it's only a question of time when all the papers will have airplanes and the race then will be the race of today; but the feature of all this is that news must be fresh enough for public consumption. The papers of tomorrow will garage their airplanes on their home roof. Even this is not fancy entirely.

The present-day universal propeller permits getting off and alighting in the smallest of spaces. Naval pilots, without even this aid, are landing daily on the decks of airplane carrier ships like our own *Langley.* They take off by catapult from cruisers and land in the water alongside. Flying off buildings was long ago done just to demonstrate the possibility.

Practically every thought-of civil application of the airplane has been actually demonstrated, mostly in America, with eminently satisfactory results.

Jenkins is sending news pictures by radio now. Tomorrow the journalistic airplane will carry its small sending set and camera, alight at the scene and send the picture by wired radio over local telephone lines to the nearest news-picture syndicate broadcasting station where it will be boosted to the ends of the earth, to be picked up by associated radio picture subscribers and turned into plates to be printed within an hour after the airplane has arrived at the x-mark. That's not fancy, either. It's being done now, save for the airplane end of it, and it's no stretch of the imagination to think of a sending set in a commercial airplane when everyone knows that military airplanes have been sending by radio since before the World War.

Closely connected with newspaper enterprise is the actual use of the airplane by a pulp and paper company of Canada for hauling supplies and personnel, but mainly for photographic survey and inspections of timber tracts. The airplane for the timber cruiser is now history. Representative and varied forest areas were photographed, checked by land cruising, and the pictures then used for comparison with those of other areas by which lumbermen were able to determine the exact extent of certain kinds of growth and the amount of timber. The limit error in ground cruising is 10 per cent; the airplane reduces this to 5 per cent. The Dominion Government is now using the airplane camera widely in similar work. Hundreds of thousands of acres along the "Road to Mandalay" were surveyed by air last year and Colombia and the United States have done extensive air mapping.

The saving of time is the big factor, just as in passenger and goods transportation by air. The United States Geological Survey used the airplane in its first practical attempt at aerotopographic mapping in the Schoolcraft quadrangle of Michigan in 1920. The area included 220 square miles and 273 photographs covered it. The actual time employed in taking the photographs was 7 hours and the total cost of the work, exclusive of the pay of Army Air Service members who made the flights, was at the rate of $3.50 a square mile. The total time consumed in the work was 5 days, including the time of flying to the place and return to the home station. It could be hardly expected that a man could walk over this territory and make a ground survey in many times these days. Since then, the airplane has been in almost constant use in government and municipal mapping, here and abroad.

As Carrier for Pest Extermination

The grocer is indirectly interested in the airplane. Aerial farming is now being practiced. Fruit growers have been interested in the possibilities of treating large areas of fruit trees from airplanes in a way that would be more rapid and efficient than from the ground. The Department of Agriculture took up the work in cooperation with the Army Air Service and the Chemical Warfare Service.

The city entomologist of Cleveland, after experiencing difficulty in spraying closely planted large trees in a suburban park, thought that such a tract could be dusted from the air.

He communicated his idea to the Ohio Experiment Station and enlisted the army in the venture. The opportunity for testing the airplane idea was afforded by a grove of catalpa trees, 6 acres in extent, at Troy, Ohio. The grove was being defoliated by the catalpa sphinx caterpillar in June and the second brood came in force in early August and was stripping the new crop of leaves when the dusting checked them.

The plane flew by the grove six times. A strong wind carried the poisonous dust over the entire grove at the rate of 10 acres a minute. Since the work was so very effective, the entomologists figured that the airplane made needless passes and now estimate 30 acres a minute as to the probability.

"Within three days after the application," said Dr. H. A. Gossard, state entomologist, "99 per cent of the caterpillars were dead and were strewn on the ground, hanging from the trunks and limbs, making the grove indescribably foul and repulsive." The airplane delivered the goods.

The airplane proved more advantageous than the horse in the dusting of cotton. For the past three years the Department of Agriculture has been fighting the boll weevil and the cotton leaf worm from the air. These experimental results have given such great promise that a special report has been printed on the subject and an airplane manufacturing company is making airplanes for this purpose. Is it possible that the airplane is going to reduce the cost of the shirt on our back? We are now planting twice as much cotton as we can use or sell, merely to give the boll weevil his rake-off.

The Teapot Dome oil reserve was awarded a commercial company for exploitation. A map or its equivalent was wanted. The territory included 330 square miles. This was photographed by airplane and the prints matched together into a mosaic. The time was eleven days for the taking of the pictures. The mosaic showed every tree, building, road, derrick and tank, as it actually existed. The airplane in the oil and mining industries!

The Airplane for Advertising

Aerial photography offers the widest opportunities in its application to everyday, academic, artistic, commercial, and governmental life. Landscape architects are now using aerials of estates, for these furnish features obtainable in no other way.

Air advertising? We have seen the airplane writing in the sky. There is nothing marvelous about this perfectly practical and attractive method of drawing attention to a product. This is but one method of aerial advertising. This field is not yet touched.

For personal business? Certainly! There's an oil man in West Virginia, after whom a town is named, who boasts that he does his business by air. He has a flock of machines, pilots and mechanics and he travels everywhere by air on his business. He took a pleasure trip to the Yellowstone, by air. He is using the airplane because it is a more economical system of passenger transportation—it saves valuable time.

In reclamation work the government has used the

Is It a Man's Gifts or His Training?

Education Has Its Undoubted Value; But What About Brains?

By LEWIS WORTHINGTON SMITH

ON MY desk just at hand in the morning mail there lies a lyceum bureau's list of speakers for the year. I find that I have heard of many of them, and yet the name of a "distinguished publicist and lecturer" therein included has never before, as my memory goes, come under my eye. This bureau is only one of many, and from some of the others I now and then receive information regarding various other notables concerning whom I have been hitherto quite ignorant. This fact, the fact of my lack of acquaintance with even the names of some considerable number of the notables, is a thing to be thought of in the light of two questions.

Am I somewhat blind to the things that are going on about me?

Is the world so full of men who are doing things that no man can reasonably be expected to keep track of their activities?

It is something more than my own vanity or egotism that makes me disinclined to give an affirmative answer to the first question. There are certainly many things in which I am not deeply interested. I remember that Voltaire declared himself concerned with anything with which any other human being could be concerned. He therefore rebukes me somewhat until it occurs to me that Voltaire's world was very different from the world in which I live. He was not submerged by the things in which he was interested and to which he could not give adequate attention. I am. On every hand I am assailed by men who have to their credit achievements challenging my regard. I can listen for but a moment to any one of them before turning to give my ear to some one else.

How About Our Great Men?

WHEN again I look upon the lists with which I am confronted I must ask myself another question. Are we producing as many great men, relatively, as many great minds, as came into being a hundred or two hundred years ago? On the other hand, are we, perhaps, producing fewer really great men and only a host of capable but uninspired mediocrities?

Some years ago a scientist made a declaration that was rather more than interesting. His pronouncement was in effect that in the course of not many years the technique of scientific investigation will have become so thoroughly developed and organized that discovery and invention will go forward with very little dependence on individual initiative and ability in the investigator. So far as that is true, in the field of science, at least, we can substitute education and training for brains. Standardization will have triumphed in no small degree over the creative impulses and energies in man.

Invention is something creative; it has its source in native human endowment.

Discovery may be quite independent of the endowment of the discoverer. In some large measure, at least, it may go forward as the result of a process of training, as the product of education, as a profit upon the first cost of the expensive educational machinery of our day. In that machinery the individual discoverer may be no more than a cog revolving on a wheel by whose motion he is carried on without his will.

The distinction between invention and discovery is fairly observable in the difference between a Newton and a Shakespeare. Gravitation and its laws were so certainly in existence that, if Newton had not seen an apple fall and had not so been led to the making of a mathematical formula, some one else would in no long time have done that in his place. He did what the discoverer must do; he looked and saw. Clearly he was not passive in the fact. He applied a mind, and a fine mind, to the problem presented to him.

None the less what he did was different in both degree and kind from what Shakespeare did. It was at least at a lower level of intellectual initiative. Beyond that it differed from the work of Shakespeare in that, while some one would certainly have done it, if Newton had never lived, we should now have no "Hamlet," if Shakespeare had died in 1600. "Hamlet" is a work of invention. It deals with the material offered its author by the universe, but it does very much more than make report of findings. No other mind in the history of human intelligence, apparently, would have given or could have given to its findings the same fullness of interpretative comment.

Scientific investigation is a relatively recent activity of the human mind. In view of that circumstance it is an interesting reflection that the two highest forms of intellectual functioning, those of statesmanship and literature, antedate it by some thousands of years. Those activities may profit by research, no doubt, but they are not dependent upon it. Consequently they could come into being and could be carried to heights of substantial achievement before science had really found itself. Moreover they were more immediately essential and useful for the life already going on. The man with a gift for social organization and the man with a mind for the shaping of thoughts into some pleasant ordering of words early found themselves appreciated contributors to community life. They have held that place to the present and presumably will hold it to the end of time.

On the other hand, no longer than a century or two ago, the man with the mind of a chemist could not expect to busy himself in the exercise of his prime faculties. He was compelled to let them lie dormant while he followed the plow or hammered on the anvil. What was true of him was true of incalculable numbers of his fellows. The man with the brain of an electrician could not so much as dream of playing with the thunderbolt. Men have sung songs always, perhaps, but music had not then made its way as an art by which men could earn a livelihood. Most of the occupations to which we now devote ourselves were then not in existence. Consequently the faculties that those occupations call into play were unused. The possessors of them, however gifted in their way, were often enough forced into uncongenial modes of life and sank, perhaps, almost to the brute.

> **The world needs leadership, never more than now, and yet leadership was never so difficult as now. The man of originality, initiative, and insight is more or less displaced by the man whose gifts are only those that have been instilled into him by the training of education.**
>
> **In our day it becomes consequently a question whether leadership shall go to brains without training, to training without brains, or to brains fortified by training.**

It is not to be understood that man made no scientific conjectures until recent times. Unrelated conjectures, however, have not been largely contributory to the general or special activities of the race. In chemistry some of the older civilizations appear to have achieved some important results. At a later date the Arabs made discoveries of moment. For our own day, however, chemistry seems to have had its beginning with Richard Boyle, who was born in 1627 and died in 1691. In the observation of plant life the long past has not been wholly uninterested and unthinking, but modern botany had its beginning as a science only in the seventeenth century. Upon these two sciences a great deal of modern life rests increasingly. Chemistry and botany go hand in hand in the production of food, whether on the farm or in the factory. Their development gives employment to a great diversity of human capabilities. They furnish opportunities for achievement and for leadership in achievement to minds that before our day must as minds, have lain fallow. They could have played with scientific guesses, if the labor of their hands had won them the necessary leisure, but there were no experiment stations and no laboratories where they could turn that play into the joy of work.

There is the great difference between the arts and the sciences that they are, the first, the products of human invention and, the second, the accretions of discovery. Between them there is constant interaction. The savage makes rude drawings with the colored juices of plants. Later he learns how to fix his colors in a medium. Oil preserves them for the eyes of future generations. When they have reached this degree of permanence they appeal to a finer and fuller ambition. Painting passes from an idleness into a devotion. Art has become immeasurably richer through the aid of science. None the less the painter is still greater than his paint, greater than the makers of paint.

Education is the great glory of the democracy of our day. In the degree in which it provides a technique by which the common mind may transcend its limitations it produces that semblance of equality that supports the democratic theory. It continually expands the ranges of human intellectual achievement. Aside from kings and lords, the priest and the writer and the lawyer were the public men of yesterday. Their words had a hearing beyond the words of others. Their heads towered above the heads of others in the ceremonial procession of the ages. In various and differing ways they took into their hands the destinies of their fellows and were its openly acknowledged great men.

"Gifts" Versus Education

THE priest has undoubtedly shrunk somewhat in stature in the last three hundred years. The didacticism of many a man who would once have worn the cloth spends itself now on the editorial page of a newspaper. The writer and the lawyer remain. They carry their heads as high as ever. If with the lawyer we may include the constructive maker of laws, they are our great men still. They deal with life and the fullness of its complexities. For their thinking no technique of discovery has been made available. They must invent new forms and new conceptions out of the experience of the race. They cannot direct that experience in the fashion of a laboratory experiment or of any other sort of technical research. They are only somewhat less dependent upon their own individual initiative than were their mighty predecessors such as Charlemagne and Plato, Shakespeare and Caesar. What they have learned from the great laboratory of life is chiefly not to say over anything that has been said vainly before, not to repeat the mistakes through which the empires of the past were turned into dust and ashes. Their laboratory is that of life in its totality. Always that has been a thing difficult for the mind to encompass within its mastery, and never has it been more difficult than now. In Caesar's day all Gaul was divided into three parts. Now that division is multiplied manyfold within the relatively narrow limits of the city of Paris.

Human greatness has at least two aspects, that of achievement and that of such inherent abilities as make achievement possible. Achievement at the higher levels, achievement that must take account of life as a whole, is more difficult than it ever has been before. At lower levels accomplishment has unquestionably become easier. It has also achieved richer results. No doubt it has further enlarged the capabilities of those who have carried it forward. Whether it has actually made them inherently greater or not, it has given them the appearance of greatness beyond that of their estate only a few decades ago. They at least make the great man seem less great by reason of his being surrounded by a host of others almost as tall as he. If they tower as high as ever above the ground they tread, they do not tower as high above the shoulders of their fellows.

From this situation there are several consequences of some human and social moment. The world needs leadership, never more than now, and yet leadership was never so difficult as now. The man of originality, initiative, and insight is more or less displaced by the man whose gifts are only those that have been instilled into him by the training of education.

The merely trained mind has pushed itself into rivalry with the gifted mind. The gifted man has vision. The educated man has knowledge and is contemptuous of the visionary.

No less is the man of ideas contemptuous of the judgments of the man who is tied to routine. It is almost immaterial whether that routine is carried forward to the sound of whirring machinery in a factory or waits patiently for results before a laboratory table. In either case the thinker sees the man so busied as a creature in some considerable degree subordinated to a process over which he has only an incidental control.

In our day it becomes consequently a question whether leadership shall go to brains without training, to training without brains, or to brains fortified by training.

While the question remains undecided, while the machine has not yet triumphed over individual capabilities, we can still change a little an old word and say that there are giants in these days.

An Intellectual Exchange

ONE of the dangers of an advancing civilization going forward through the mechanism of an educational process is that it opens the door to so many various activities as to endanger the social homogeneity of that civilization. Human beings are not equal and never can be, either individually or racially. The notion that they are so or may be so is no more than a dream of humanitarian sentimentalists. In any large social whole there will inevitably develop a social stratification that may approach or become a caste system. In a society in which class sectioning is on a single basis, that is not necessarily an evil. Intelligence and character should not be compelled to rub shoulders too closely with ignorance and vulgarity. Keeping them apart because of their fundamental unlikeness is justifiable.

In a society so diversified that it must have many measures of social value the problem is serious and may at any time become acute. It is acute from San Francisco to Boston and from Rome to Leningrad now. The superior man, thinking and inventing, devising and constructing, making and teaching his fellows how to make, has put instruments for his own undoing into the hands of all men everywhere. He is at the mercy of the outlaw who can buy a gun that neither he nor his father nor his father's father could have originated. He must borrow money from some trader who exploits the productions of others and for himself produces nothing. In such a world the gifted man, the superior man, has a handicap. He lives in an atmosphere of exchange. His gifts are turned into something for which he receives pay. After that give and take his gifts have largely passed from him to the purchaser. To the public eye they appear very much the same. The man endowed with an original possibility of greatness has lost his advantage and almost invariably his received no adequate compensation.

Education is a process of intellectual exchange. In the fashion of the world of trade it dispenses the capabilities of the richly endowed and so changes the poverty of the common man into what seems like affluence. The pioneers who made America and turned its original ugliness into beauty have been followed by a host of lesser folk eager to eat at our table. In popular education a like thing happens. It is the open door to immigration into the world of knowledge and of thought for all those who cannot for themselves force a way from their own familiar and well-trodden fields to the unknown and the undiscovered. They eat at the gifted man's table. Then when the feast is over and host and guests go out on the street together, there is to the common eye no appreciable difference between them. They talk the same language, because they have been talking together. By whose care in inflections and in verbal niceties of speech it has been brought to a sort of tonal unity, only the man who carved the fowl for the feast really knows.

None the less, despite all the obscuring of the vision that has come about in these ways and that must be recognized, we have great men among us. We should perhaps learn to recognize them more surely. Then we should see to it that their educational opportunity and profit is above the average as their gifts are higher. We should not permit them to be crowded to the wall by the mediocrities. If we cannot attend to the mediocrities and at the same time do the best for the best, we should let the mediocrities go. Education at the higher levels is for leadership, for initiative, for inventive achievement. Even in a democracy not all can lead. As soon as it is at all questioned whether we do or do not have great men, it is time to ask what we have done to them. Have we asked them to march in a mob and be one with anybody and everybody that chooses to come? Possibly, and even more than possibly, in my judgment, it is time to stand at the door of the college and the university and thin the mob on its way to the seats of honor. This very thing is now being done in America.

Mr. Ford's Page

THE majority of human minds being of single-track variety, seeing only one end or pursuing but one purpose at a time, it follows that human advance has been uneven. One interest has forged ahead of the rest, then lying fallow for a time while the neglected interest has its day.

The motives by which men move have differed at times, and though the quality of achievement has changed as the motive has changed, taken all together they have combined to produce one general result. And this general result is not bad so far as it has gone. It may be criticized, however, as having required too much time to have come as far as it has, and to have shown too great a reluctance to go farther.
